An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.
Publishers.

SAN FRANCISCO, SATURDAY, JULY 7, 1888.

VOLUME LVI.
Number 1.

Growth of the Mining Industry.

Few people beyond those directly interested realize the great advance which has taken place within the past few years in the mining industry, or how much is being done to day. To one who, like the writer, reads the "interior" papers published in the various mining towns and camps on the Pacific Coast, this realization is, however, complete. In all directions hundreds of men are prospecting for, working, developing, finding and making mines. Thousands of these mines are entirely unknown and unheard of outside the little camps where they are located. Yet there are possibilities in all, and their owners are working to develop them. It is work, work, work, in all directions; but there is encouragement always. Never a week passes but there are numerous "strikes" recorded, and each of these serves to show that the "turn" of others is liable to come at any time.

And of these smaller mines that are producing ore we hear little, but every crushing of rock adds so much to the wealth of the community. The miner who realizes his few hundred from a "crushing" is not heard of as is the mine that advertises its dividends in the thousands. Yet in the aggregate it is these little mines that make the immense difference between "total product" and "dividends" in the statistics at the end of the year. Even the mines worked at a loss add something to the wealth of the community. If it costs \$2000 to get out \$1000 there is \$1000 more than there was. The original \$2000 has merely changed hands, and the amount realized is in the channels of trade. The community is benefited if the individual is not.

Not only are there now many new camps being opened, but old mines abandoned in our days of extravagance are being re-opened and worked with profit. Ore is being worked cheaper than ever before, and our metallurgical skill is greatly improving. In the older mining regions many of the evils have been done away with. The top-heavy system is fast going out of style and more money is spent for actual work than for style in officials. To cheapen matters, water-power and electricity are replacing steam wherever practicable. People are working mines more systematically and carefully, having the future in view more than was formerly the case. Altogether, the whole outlook of the mining industry is encouraging.

MINING SUIT COMPROMISED—The great mining suit which has been pending for years between the Eureka Hill Mining Co., and the Bullion-Beck Mining Co. of Tintic, Utah, has been compromised upon a basis satisfactory to both parties. The property involved in these suits is valued at over \$2,000,000. Ex Governor Perkins is president of the California company that purchased the Bullion Beck interest, and John O. Packard is president of the Eureka Hill Mining Co. The basis of compromise is vertical lines from the surface down, and concessions have been made on both sides.

THERE is again trouble at the Wilkeson coal mines, Washington Territory, where the miners are rioting.

FRANCE takes more of our crude mineral oil than any other country, but in refined oil Germany takes the lead.

Portable Smelting Furnaces.

These portable smelting furnaces with William's improvements are made from 16 to 20 inches diameter, as shown in the elevation and section, Figs. 1 and 2. They have adjustable bottom plates the same as the large furnaces illustrated in the PRESS last week, and are also of the water-jacket type. They are made of thinner iron and separated into parts so as to be trans-

Number of Paying Quartz Mines.

A California paper, after canvassing the field, puts the number of paying quartz mines in the United States at 150. While this may include all the larger companies operating, it by no means takes in the much greater number of small ones who make a livelihood at this business, and generally some money besides. There are, in fact, more than 150 companies who make quartz mining pay in California alone, some of

The Key Monument.

Our people are just beginning to realize how much the late James Lick did for them when he left his great estate for the benefit of the public in California. The Lick Observatory is completed and in running order. The California Pioneers have their fine building and the Academy of Sciences will soon have theirs. It will not be very long before the free baths will be available, and one of the statues for which he provided has just been unveiled. It will be remembered that Mr. Lick left sums for several statues and groups. Some people among us thought this rather a waste of money and a queer thing to do, but as a community we have too few objects of art among us. There is no public art gallery of note as in older cities, and in statuary there is nothing here. The group that James Lick has provided as an ornament for the City Hall grounds will be a notable feature in this city, and it remained for him—a Californian—to be the first to erect a statue to the author of the "Star Spangled Banner."

Appropriate to the celebration of the birthday of the Nation were the ceremonies attendant on the unveiling of the statue of Francis Scott Key in Golden Gate park. The sum of \$60,000 had been set aside to build this, and to an American sculptor, W. W. Story, was given the task. This monument is the largest and most imposing structure of the kind in California. Three steps lead up on each side to a square pedestal amply ornamented with corner buttresses, evels, panels and mouldings. From each corner rise four Corinthian fluted pillars bearing aloft a handsome marble canopy, under which, in a sitting posture, is the bronze figure of the poet. On the top of the cupola stands the female figure of "America" bearing a flag-staff, from which falls in graceful and massy folds the famous banner. On two of the four panels the words of the poem are engraved. On the third is the inscription, and on the fourth a lyre in emblematic device. The whole structure is 52 feet high, and the figure of "America" with the colors is 13 feet, and that of the poet 8 feet.

An immense throng of people gathered to witness the ceremonies of unveiling. This was one of the most imposing features of the celebration of the 4th. Addresses were delivered by Park Commissioner Hammond, W. H. L. Barnes, T. J. Clunie, Irving M. Scott, and Mayor Pond. National airs were played by the band, and when "The Star Spangled Banner" was given by the band and 100 voices, the great audience joined in the chorus. This was also done with the national anthem, "America." The occasion was one to stir the patriotism of the people, and will be long remembered by all.

THE terms under which the Calumet and Hecla and the other American mines passed into the Copper Trust were 13 cents per pound for all the copper the mines could produce during a period of three years. It was further agreed that should the price of copper go above that figure the mines going into the combination should receive half the profit accruing from the advance over 13 cents.

THE Virginia Chronicle says the developments in the Wild Goose and Harris mines in Jumbo district, near Franktown, caused great excitement among miners, and the foothills west of Mt. Davidson are swarming with prospectors.

FIG. 1.

FIG. 2.

PORTABLE SMELTING FURNACE WITH WILLIAM'S IMPROVEMENT.

ported by pack mules. There are four tuyeres connected to an annular wind-box in the usual manner but with flexible pipes and detachable nozzles, so the tuyeres can be bared for examination instantly. There are four arches, so that every part of the interior is accessible for cleaning. Two of the arches are cut through at the bottom to permit a lead-well and siphon to be used if required.

The blast required for these small furnaces can be provided by any of the well-known means, and when power is not available, hand apparatus, such as is shown in the drawing, can be used. These furnaces will smelt from one to five tons in 10 hours, according to the amount of blast and nature of the ore. These furnaces are also made by Messrs. W. T. Garratt & Co. of this city and furnished with all the required fittings.

these consisting, of course, of only a few individuals. The above estimate must therefore be grossly out of proportion to the whole number of companies so engaged.

In other sections of the country these companies are not so numerous as in California, and that because we have here more deposits of this kind than are to be found elsewhere, the facilities for working them being also especially good. Our people, through long experience, have become masters of the business, while our methods and appliances for carrying it on have also been brought to a high degree of perfection. We have for our population an unusually large number of self employers, a fact due to these other exceptionally favorable conditions. That the number of paying quartz companies in the entire country as fixed on by our contemporary is much too small is evident.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Kernville Notes.

EDITORS PRESS:—Doubtless a few notes from this secluded locality will be of interest to some of your readers, for though mining has ceased to be the leading industry of California, still the miners are not all dead, and there are indications that the mining industry may yet revive and be established upon a more enduring basis.

There are many leads here which have not been worked since the time that flour was hauled from Stockton with ox teams, a distance of 300 miles; and yet many of those leads, now abandoned, have yielded fortunes to the prudent miner, or a poker stake to the average mining superintendent.

For the most part the placer mines were exhausted 30 years ago. A few placer deposits remain, but as a rule the young men now herding sheep and cattle look upon placer mining as a lost art. Quartz mining is still indulged in by a few workmen who have arastras or little five-stamp mills, by which they are settled with their families and doing a legitimate and quiet business.

The great Sumner mill, erected at a cost of \$1,000,000, and in connection with which more than \$2,000,000 have been recklessly squandered, stands listlessly idle. The main ledge (the Big Blue) has been worked to the level of Kern river, and an incendiary destroyed the ponderous hoisting works and pumping gear, which cost \$65,000. The main body of the yield of this mine undoubtedly came from small feeders coming in from the southwest; and as the extraction of ore from these is necessarily slow and tedious it would not pay to refit an 80-stamp mill. The fact is if we ever expect to place gold mining upon an enduring basis here we must have down with "English eyecuttes" and \$250,000 mills.

There is much talk of a railroad having been projected through the Kern river canyon, and two or three corps of engineers have examined the ground. Having passed the canyon and attained an altitude of 2600 feet, there is an open way through the Monaches valley and to the Colorado desert beyond. The canyon offers as feasible a pass as any river gorge in California, and could be passed with an absolutely level grade, coming out among the foothills of Posa creek. This route would pass to the East, where the early prospector hought water by the quart and wood by the pound. It would doubtless revive the spirit of mining and open a new Dorado. Kern river probably outranks any other mountain stream in the State during this dry part of the year. Its principal branch courses southward across Tulare county and a part of the way across Kern (a distance of 100 miles) before taking to the canyon through which it passes to the valley. Immense areas of timber are adjacent to either bank, and the water of the canyon would furnish milling power to mill all the ore west of the Colorado. Mr. Sherman, of Havilah, at one time used a part of this power to drive two quartz mills at that place. The power was transferred a distance of six miles by means of compressed air conveyed through four inch pipes. But incendiaryism has followed up a very genial and worthy gentleman from one point to another through some six conflagrations, until now it may be difficult for him to resuscitate his fortune. Thanks to this law, the devil is in the penitentiary. The experiments of Mr. Sherman with compressed air are sufficient to explode many theories in regard to the transmission of power by that means, and good engineers have declared that a sufficient power could be generated and shipped under a pressure of 500 pound to the inch, to propel all the traffic of this coast across the mountains.—S. B.

Kernville, Cal.

Los Barros Mines.

EDITORS PRESS:—Los Barros Mining district, 22 miles west of Jolon, Monterey county, situated in the San Lucia range of mountains, on the coast, three miles from the ocean, is beginning to receive considerable attention. This district is a little over one year old, the first discovery having been made in April, 1887, by Wm. Cruckshank & Son on their claim known as the Last Chance. This mine has a well defined ledge 4 feet wide, 35 feet from the surface and averaging from \$300 to \$400 per ton. A three-stamp mill has been erected. The mine has paid all expenses and left a handsome sum in the owners' hands besides. Other locations are the No. 2 Manchester with a good pay ledge, Ophir with a good pay ledge six feet wide, and Ajax (a free gold).

There are a great many other locations in the district, some of them with good prospects. There is plenty of water and timber and an excellent climate. The nearest railway station is Kings City, thence by stage to Jolon (20 miles), then 22 miles over a good trail to the mines. There is a good wagon road half way and from there pack train or saddle horses may be obtained.

M. HIGNETTE makes a white artificial stone from sand, which has been used for polishing plate glass.

The Astronomer's Dream.

[Translated for the Press from the French by M. N. M.]

In his poetic manner, the eminent French Astronomer Camille Flammarion says: "I had a dream which was not all a dream. In it I found myself observing people who about a hundred millions of years ago inhabited a planet situated in the cortege of one of the remote stars in space, in the midst of a sidereal universe analogous to that which now exists, though not the same, because the universes of that time is destroyed and the universe of today did not then exist. There were, as in our epoch, constellations and stars, but they were not the same constellations, nor the same stars. There were suns, moons, inhabited worlds, days, nights, seasons, years, centuries, beings, impressions, thoughts, facts; but they were not the same.

Our earth was not yet formed. The materials which composed it were floating in space in a state of diffused nebulousity, gravitating around the solar center, which was gradually condensing. There was neither water, nor air, nor soil, nor stones, nor vegetables, nor animals, nor even any of the bodies reputed simple by the chemist, as oxygen, hydrogen, azote, carbon, iron, lead, copper, etc. The gas which would by its condensations and ulterior transformations give birth to the divers substances, gases, liquids or solids, which at the present time constitute the earth and its inhabitants, was a simple gas, homogeneous, containing in itself unconscious chrysalis, the possibilities of future times.

But No Prophet Could Forecast

The unknown which was slumbering in its mystery. Our planet presented then, this aspect of those vague nebulae of gas, which the telescope discovers in the depth of the skies, and which the spectroscope analyzes. In the midst of the stars the nebulous sun was floating in process of condensation. Humanity, with all its history, each one of us with all his energies, all terrestrial beings were in germ in that nebula and in those forces; but the beings and the things that we know were only to exist after a long incubation of centuries. In the place of what was to be the Earth, there was nothing but a gas, floating in the starry immensity. Yet it was not in the actual place where we are at present, because the Earth, the planets, and all the solar system came from afar and travel speedily.

In the history of creation, 100,000,000 of years pass like a day; like a fugitive dream they are effaced, and vanish into the bosom of eternity, which absorbs all. * * * Though our planet did not then exist, there were, as to day, stars, suns, solar systems and inhabited worlds. The beings that peopled those worlds lived their lives as we live ours.

It was an exciting spectacle for the thinker to contemplate the great labor of all those beings. In indifference, or in passion, in pleasure or in sorrow, in smiles or in tears, they were living, agitating, reposing, combating, pardoning, accusing, forgetting, loving, hating; swept away in the fatal whirlwind; coming into the world, dying, succeeding each other blindly, through generations and centuries; ignorant of their origin and of the future fate of monads and of souls; sports of nature which inflates worlds and beings, stars and atoms, centuries and minutes, like those bubbles of soap which a child blows in the air. It was the spectacle which the earth presents to us to-day; multitudes waging a battle for life and ending only with death. The view that must strike us most in that retrospective contemplation is, that the earth did not then exist.

No Human Being Approached

Anywhere near to the time when it could be one of its inhabitants. Nothing, nothing of what exists around us now, was then in existence. Nevertheless, upon those ancient worlds so long since vanished, those who were enlivening them had their current history, flourishing cities, cultivated fields, social organizations, wars and battles, laws and tribunals, sciences and arts, historians, economists, politicians, theologians, and men of letters who were striving to discern the true from the false, and to write conscientiously what they too called "universal history." For them, all creation had been stopped in their time and at their place; for them, everything was finished; the rest of the universe without bounds, the rest of eternity without limits was lost in insignificance, eclipsed by their actuality. They did not know that eternity was before them and would be after they had passed away.

They lived, the learned and ignorant, the illustrious and obscure, the rich and poor, the opulent and miserable, the religious and the skeptical, as if their lives were never to have an end. These were accumulating, without forgetting for an instant, a fortune which their sons were eager to dissipate; those were dreaming and contemplating, without care of the morrow; here some battalions were inflaming the populace by their patriotic clamors; yonder some couples were uniting in mystery their quivering souls. Pressed as they believed they were, by affairs of imperious importance, carried away by the allurements of pleasure, or lifted up on the wings of ambition, they of that time, as of this, were plunging in the vortex of life.

The History of the Eternity

which precedes us, is not only of peoples, of kingdoms, and of empires which have dis-

appeared; it is of entire worlds, of groups of worlds, of archipelagos of planets, and of universes. To eternity there is no beginning. The forces of nature have never been inactive. In nature, our measures of time, our conceptions of duration, do not exist. For it, there is neither past nor future, only a perpetual present. It continues unchangeable through its incessant transformations and manifestations. It is we who pass away; it remains.

I cannot reflect without terror upon the innumerable beings who have lived in the worlds that have disappeared; upon all the superior intellects which have thought, acted and guided humanity in the path of progress, of light and of liberty. I cannot think of those Platos, Marcus Aureliuses, Pascals and Newtons of the vanished worlds without asking myself what has become of them. It is very easy to reply that nothing of them remains; that they have died as they were born; that all is dust and returns to dust; the reply is easy but not very satisfying.

Assuredly I have not the simple pretension of resolving the great mystery. It seems to me that in treating these unfathomable problems of eternity and of infinity we are pretty much in the condition of ants endeavoring to inform themselves of the history of France.

It Would be Without Doubt

As useless as it would be childish to lose ourselves in the nebulosities of metaphysics by trying to find a solution which will probably always escape us, but is it not a subject of contemplation worthy of our thoughts, to reflect upon that particular aspect of creation, Time; to reflect that throughout eternity other earths inhabited like ours, have floated in the light of their suns, that through all eternity there have been beings enjoying life, and that during all time, the hour of the end of their worlds has sounded on the secular dial of destiny their doom, shrouding in turn the universes and beings in the winding-sheet of destruction and of oblivion? It is impossible for us to conceive a beginning which had been preceded by an eternity of inaction, and so far as science conducts us, it shows us everywhere forces in perpetual activity. If infinite space dazzles us by its immensity without limits, eternity without beginning and without end rises up more formidable still, perhaps, before our terrified contemplation. The voices of the past speak to us from the depths of the abyss and they speak to us of the future. The past of the worlds which have disappeared, is the future of the earth.

In 100,000,000 of years, the earth on which we are will no longer exist, or if any ruin of it yet remains, it will be only a mournful desert. The divers worlds of our solar system will have finished their vital cycle, and the varied histories of mankind which succeeded each other will have been long extinct. Our sun itself, will without doubt, have lost its light, and will roll a dark object in the nocturnal immensity. Throw a hack, perhaps, by the laws of destiny into the crucible of perpetual metamorphosis, it will be reunited with a supreme shock to that defunct old sun, and, hurled like it through the eternal void, may be revived from its ashes a radiant phoenix, relighted by the transformation of the movement into heat.

In That Time, Moreover as Now.

The nebula will have produced suns, and as to-day, boundless space will be studded with stars without number, gravitating in the harmony of their reciprocal attractions; then, as now, earths will be halanced in the light of their suns, the mornings and evenings will succeed each other, blue skies will expand, clouds will float in the charm of twilight, and perfumed atmospheres will flow over woods and valleys. Nature will sing the marvelous budding of life, as to-day, and chant the hymn of youth and happiness and imperishable spring-time, in that immense universe where the historian of the past sees only tombs.

If there are no limits to space, if toward some point of the heavens to which our thought takes its course, it can fly evermore, without anything to stop it, whatever may be the rapidity of its flight, whatever may be the duration of its indefatigable soaring, if, in a word, space is infinite in every sense, it is the same as eternity. * * *

Infinite space is actually gemmed with incipient worlds, with worlds which have attained a virile age, it is strewn with worlds in decadence and worlds dead, it disseminates in all the boundless regions of immensity, gaseous nebulae, suns of hydrogen, oxyd stars, planets in formation, satellites cooled, and comets disintegrated. The forces of nature show themselves everywhere in activity; the energy of creation remains constant, without possibility of augmentation or diminution, and all the sciences coincide in testifying that what we call destruction, annihilation, is only transformation. Astronomy reveals Time to us, as it reveals Space; it shows that our present epoch has nothing particular in the history of nature any more than has our present place, and invites us to recognize duration as well as space, those two forms of reality, contemplating in the same synthesis the grand aspects of the universe. * * *

This Dream Was Not All a Dream

For the beings who have lived upon the different worlds in space during the eras anterior to our solar system, the earth, with all its history, was only a possibility of fecundations for the future. Historiographers of

terrestrial peoples, Moses, Herodotus, Manethon, Ma-Tsun-Lin, Titus Livius, Tacitus, Gregory of Tours, Bossuet, all you who imagine yourselves writing "universal history," and thou, great Leibnitz, who didst commence at the creation of the world the history of a small German duchy, and thou, also, charming author of the *Metamorphoses*, who to us hast related of old the origin of heaven and the gods, the astronomer smiles at your famous annals, as he smiles at the genealogies of kings and the conquests of the Cæsars.

Comets of ants upon small spaces, natural illusions of children who caress their puppets! Let some one invent a new microscope that will enable us to distinguish Charlemagne and Napoleon in the ant-hill of Lilliput. We no longer find them. And the whole earth, where then is it? The abstraction of the thought comes to us of living before and after it. The entire history of it has vanished like a flash of lightning which passes over in the stillness of a long summer's day. * * *

As I contemplated those pncornas of time and space, which the centuries of the past defiled slowly before me with their large corteges of disappeared glories, the beings who peopled the revived worlds to their furthest extent cast away their shrouds and walked in the flowery paths of life; all that secular and prodigious past became present, and the millions of extinct suns, of era upon era, became relighted and resplendent. Innumerable stars appeared in the sky, which our mortal eyes have never seen, and the light of life radiated upon celestial shores which succeeded each other to infinity. Suddenly, an immense black veil fell from the height of the skies in front of those luminous bodies, and I beheld no more. Before that veil the planet on which we are was turning with its velocity of a hundred thousand kilometers an hour, and I was again in the condition of the other inhabitants of this earth, who live without seeing beyond their horizon, and who imagine that in time, as in space, our mediocre race of human beings is the only one that ever had a place in the universe.

Laziness and Luck.

About three years ago Frank Martin sold his Horn Silver mine at Era for \$56,000. By his drinking and gambling he has reduced this to about \$1000, and his wife now petitions the Portland court to have a guardian appointed for him.—*Idaho Register*.

To read the above paragraph, says the *Nex Peros* (Idaho) *News*, one would naturally say that there was nothing in it; that it was a common every-day occurrence. But read this: Three years ago Frank Martin was as worthless a vagabond as could well be produced—one of those who never missed a meal nor paid a cent. He resided at a place called Era, in Altnas county, in this Territory, had no occupation and sponged his living from his brother, who had a small ranch and kept the postoffice by the roadside. One day his brother's wife requested Frank to cut some wood. He refused, whereupon she heat him out of the house with a rolling-pin and forbade him to ever enter her doors again. Sad and dejected at the condition of affairs, Frank walked up a hill in the rear of his once happy home, until within a short distance of its summit, when he sat down upon a flat rock, at the same time stretching out his legs and bracing his feet against a small howler in front of him. He had not been there long when the howler gave way and went rolling down the hill. Frank raised himself and listlessly followed after the rolling stone, and just here will we digress and say that his then experience exploded this aphorism that a "rolling stone gathers no moss"—and picking it up, was surprised at its weight and general appearance. He showed the stone to some miners soon after, and they pronounced it horn silver ore of the richest character. Thereupon Frank prospected the place and soon found a ledge that paid big from the start, so that in less than a month after opening the mine Mr. Frank Martin's check was worth its face, from \$3000 to \$5000. He had hosts of warm friends—indeed his friends were red hot—reaching from Houston on the north to Blackfoot in the center and Hailley and Salt Lake in the East.

One evening, after delivering a shipment of his ore to the reduction works at Hailley, Mr. Martin dropped into a restaurant and ordered a square meal. He was promptly served by a comely waiter girl, and, being in a somewhat hilarious mood, challenged the girl to marry him then and there. She accepted his proffer, a Justice of the Peace was sent for and the twain were made one. About six months after this he sold his mine for the sum above stated, and, naturally enough, the transition from extreme indigence to much wealth unshipped what little intellect he had.

Moral—Wealth is a blessing to some but a curse to others.

PHOTOGRAPHING FROM THE LIGHT OF FIREFLIES.—Dr. John Vansant, of the United States Marine Hospital at St. Louis, claims to be the first to have taken photographs by the light of fireflies. He placed 12 fireflies in a three-ounce bottle, covering its mouth with fine white hosiery. The average duration of the flash of each insect was half a second, and the luminous area on the abdomen was about one-eighth of an inch square. The time of exposure was 50 flashes.

SALT LAKE CITY is to have an industrial school.

The Close Fist Company.

Some Things That Stand in the Way of Prosperity.

"The old claim is pretty well worked out, in fact has been for a good while; but it is hard for two old chaps to move. So Pard and I have picked over and up the bedrock, cleared up the crevices and worked poor dirt year after year. But recently Pard said he was going to see if he could not buy or lease a piece of ground owned by the Close Fist Mining and Water Company. He said he knew just what the company paid for the ground ten years ago, and as they have never stuck a pick into it he thought they would be glad to get what they gave for it or to lease it on reasonable terms. So he saddled up the old mule and lit out. He returned yesterday. I saw he was disappointed and had seen things that had 'loaded' him. After supper I asked:

"Well, what did you do?"

"Nothing," said he rather short.

He drew several long whiffs from his pipe and then said:

"I don't understand some things. I could not get that ground for love or money—unless I paid ten times what I could afford to. The company that owns it has not touched it for ten years, in fact, have never stuck a pick into it; but that makes no difference. All I could get out of the agent was: 'We have no ground to sell.' Of course that settled it. In going and coming I saw at least a dozen old claims that I know would pay decent wages to laboring men that are and have been idle for years, and not the remotest hope of their being worked. I heard maledictions, loud and deep, poured out on the owners of patents that cover hundreds and thousands of acres of good mining ground that is good for these times. One man said to me: 'The anti-debris people are hard enough, the Lord knows, but they are not one-half as poison as this infernal law that permits a few men to hold thousands of acres of mining ground in idleness year after year.' Well, I had to give up the mining project, so I thought I would go and see if I could get that farm old Bill D. left to his widow who lives somewhere in the East, and if I could, you and I could go to raising fruit and garden truck. There is as nice a farm, or rather a nice piece of land as lays out doors, and worth four times the price asked, but there is no title. A mining patent covers the ground, and so we would be liable to be hounded any day. For mining, the 160 acres ain't worth 10 cents, but it would make a lovely home for anybody with muscle and brains. It saw a place all grown up to hush and weeds, and my attention was arrested by seeing a scrubby peach tree and a tangle of roses among the general waste. I was told that a few years ago there was a fine orchard of apple, peach, pear and plum trees and a good set of farm buildings on this place. It is now a wreck. A mining patent covers it and drove out the farm owner. I saw five of these abandoned and wrecked orchards and farms on my trip—places that seem to curse their present owners. Not one of these places I saw will ever be mined, but the mining law has ruined them and left them monuments of either the law's stupidity or somebody's rasality, blamed if I know which. It seems to me our laws ought to permit the cultivation of ground until the owner of the mineral wants to take the mineral out. Again, does it not seem tough that mining ground can be held year after year in great tracts and not be worked, when there are hundreds of men that would be glad to get it? Between the valley farmers and the mining patent owners, it looks as though the people of the mountains would have to leave."

"Well," I asked, "what are you going to do about it?"

"I am going to stay here a little while longer and then git, and the Close Fist and its allies can take the county and put on all the Chinamen they want to. I am too old to enter a fight with millions of money, owned and manipulated without fear of God or men, so when we have skinned the last particle of dust out of this old claim we will dig our few hills

of potatoes and take our line of march for—the Lord only knows where."

The old man knocked the ashes out of his pipe with a vicious whack on his thumb-nail, cast a side-long glance at an old rifle that hangs on the cabin wall and went out.—*Nevada Transcript.*

Cost of Mining.

Dr. George C. Munn of the Denver mint in his report of the production of the Colorado mines, gives the following as the output of some of the Clear Creek county mines:

Colorado United.....	\$131,111 04
Colorado Central.....	283,806 79
Diamond Tunnel.....	141,984 82
Freeland.....	105,855 92
Jo Reynolds.....	175,476 40
Atter.....	60,801 10
Little Mattie.....	52,342 42
Pitkin.....	115,430 75
Seven-Thirty.....	143,131 67
Two Sisters.....	63,600 94

He gives the following as the total products since 1859 of three of the oldest mining counties:

Clear Creek.....	\$35,502,693 68
Gilpin.....	47,463,313 76
Summit.....	13,704,731 03

The estimated cost per ounce of mining gold and silver in the different counties is as follows: Boulder, \$1.70; Chaffee, .145; Clear Creek, .48; Custer, .136; Eagle, .21; Gilpin, .54; Gunnison, .48; Hinsdale, .64; Lake, .3516; La Plata, \$2.50; Ouray, .755; Park, \$1.29; Pitkin, .165; Saguache, .43; San Juan, .13; San Miguel, \$1.47; Summit, .145.

The estimated value of the bullion produced in Colorado from the date of the first discoveries

The Prospector.

The prospector is seldom a man of means, says the Nevada Co. Herald. Neither is he a scientific mineralogist. The man of means does not care to dig in the earth for gold-bearing ledges, and the mineralogist finds everything but quartz. The Simon-pure prospector is a poor man, and he goes to prospecting knowing that he may find something which will remove poverty from him, and place him in a position to enjoy the real pleasures of life. With this hope he goes into the hills and canyons, into the woods and thickets, and hunts for gold-bearing ledges. It is not a pleasant task. Day after day he searches, and day after day he is disappointed. But he does not give up, and at last he finds that for which he is hunting. A ledge which "looks good" is struck. He fixes his camp there, and proceeds to sink a shaft. He is alone and the work proceeds slowly. He may be oved on and killed, or any one of a hundred accidents may befall him, and there is no one near to offer assistance. Yet he does not falter, but digs steadily, only pausing long enough to go to town or to a country store and lay in a fresh supply of provisions. Sometimes weeks, or even months, are spent upon the "prospect." At last he strikes a body of good ore. He feels sure that a fortune is near at hand. But he cannot develop it. He must enlist capital or sell his prospect. To this end he selects a quantity of specimens and goes to town. Then the hardest part of all the work begins—that of getting somebody interested in the "find."

If the rock shows a large quantity of free

there have been more and better developments made the past three years in quartz than during any similar period in the history of the county. Instead of two quartz-mining districts, which the county had five years ago, it now has five. Grass Valley is the oldest district, and it is better to-day than ever. Nevada City district has had a "hid eye" for a time, but it is certainly shaping itself for a big showing after a while. While extensive work has been suspended in this district for awhile, developments of an important character have been going on in the interior which will prove our assertions. Washington, Eureka, and Columbia Hill are safe for a good showing for years to come. From private letters we are informed of very flattering prospects in two other counties, and these strikes have been made by men who have been liberal in prospecting for years without favorable results until now. God bless the liberal gold prospector! They deserve success and in the end they always get it. Mining is coming into great prominence again in California. Every good strike kindles a desire for investment of capital. Mining, when successful, affords greater profits than any other field of work. It will attract its share of capital from this time on, and mining counties will jump into a new era of prosperity.—*Nevada Co. Herald.*

A Historic California Town.

Generally by a historic town in California we mean a town which has lived through the Mexican regime and continued through American occupation, but we refer now to a town which sprang up since the occupation and is one of the oldest towns with a purely American history. It is the town of Benicia, which was founded by the early American settlers and was designed as the metropolis of California. The place was made the capital of the State, and it seemed that the substantiality of the city was assured. But by one of those vagaries for which trade is noted, the scene of busy commerce shifted, the capital was moved, the interests which promised to contribute to a city's growth were dispersed, and the town of Benicia, with its wealth of natural advantages, is yet one of the smaller municipalities of the State, and awaits with never-dying hope the fruition of its early promise. It has a permanent population of 3000 or more. It is about 30 miles from San Francisco, and 57 from Sacramento.

VIEW OF A PORTION OF BENICIA, LOOKING SOUTHEAST.

in 1859, to the close of the year 1887, is as follows:

Gold.....	\$82,673,125 92
Silver.....	176,145,640 80
Total.....	\$257,818,766 72

THE COPPER QUEEN ROAD.—Active work has begun on the new line of railroad to run from Fairbank, on the New Mexico and Arizona Railroad, a branch of the Santa Fe, to Bisbee, where the mines of the famous Copper Queen Mining Company are located. The distance will be about forty miles. The road will run through Tombstone mining district, but will not strike the town of Tombstone. It is said that the road will be built by the Copper Queen Mining Company, through probably it will be operated by the Santa Fe Company. For the present the road is intended to supply a local demand, but the probability is that it will eventually be extended to the rich mining country in Sonora, Mexico, immediately south of Bisbee.

JOHN WILLIAMS, a well-known mining man and an old resident of California, died at Placerville on Tuesday of hemorrhage of the lungs. John Williams has been in California since 1852, and has traveled through Brazil, Central America, Africa and Australia in connection with mining matters.

A USEFUL DEVICE.—A rubber funnel which may be fitted over the head, big end up, so as to enclose all the hair while the barber shampoos a customer. A tube hangs down behind, so as to carry away the suds, while a hose for flushing out the hair, funnel and tube is provided.

gold there will be no trouble in getting men who have money to go and examine the ledge. But in many cases the inspectors declare it is too small, or not as good as represented. They have a long consultation, have assays made of the rock, decide that it is not what they supposed, and finally decline to put any money into it. Then the prospector begins again. He goes from one capitalist to another. The months drag by, and at last he finds that he must either sell his find or leave it. Somebody has offered him a low figure for his claim, and he may or may not accept it. Nobody recognizes his right to ask a fair price for it. They tell him it is only a prospect; it may pinch out, or be only a pocket-ledge, or anything but a good mine in embryo. At last he sells the property, and the new owners develop it. It becomes a good paying mine—a valuable property. The prospector, who has spent months upon it, has received a few hundred dollars, and the new owners reap a harvest of many thousands. It is this method of treatment on the part of capitalists that puts a check on the prospector's work. The man who hunts for gold is not encouraged. His reward is too small. He must do his prospecting at his own expense, and then, if he is successful, there is nobody willing to give him a fair compensation for his time and labor. On the contrary, every man would sooner take advantage of him. This checks prospecting, and when prospecting is checked in a mining region, the prosperity and development of the region itself is checked.

MINING PROSPERITY.—There is no question about the splendid outlook for the mining industry of California. In all our exchanges we see accounts of good strikes, and in this county

The Central Pacific railroad runs through the town, crossing the Carquinez straits upon the mouster ferry Solano, which conveys cars and locomotives across the stream. At Port Costa, on the other side of the straits, connection is made with the Southern Pacific railway, which runs to Los Angeles. There is thus a convergence of railway lines at Benicia and Port Costa that makes this locality favorable for manufacturing and shipping, and immense wharves and warehouses have sprung up, and there has been established, in some measure, the results that the early settlers of Benicia foresaw. But the interests are now scattered. Could they have been concentrated in Benicia, the city would be one of the most flourishing in the State to-day. The favorable conditions, however, are being more and more appreciated, and Benicia undoubtedly has a prosperous era ahead.

The site of the city consists of hills and sloping or rolling land. The heights back from the water front offer elegant building spots, and already numerous showy and pretentious dwellings are to be seen. The view from these elevated sites is fine indeed, looking out upon the turbid waters of the straits, and over to the highlands of Contra Costa county beyond. To the west, the waters of San Pablo bay spread out, offering a water stretch as far as the eye can reach.

Our view of Benicia looking toward the southeast, shows a part of the town in the foreground. Beyond flows the magnificent Strait of Carquinez, a mile in width, connecting the upper bay of Suisun and the lower bay of San Pablo. Opposite lie the low rolling Contra Costa hills, while away to the southeast looms up the purple dome of Mount Diablo, as shown on the left of the distance in the picture.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. *Amador Ledger*, June 30: Preparations are being made for sinking at the Wildman mine, which will be commenced in a short time. In all probability they will sink 100 feet, which will, we hope, develop an excellent mine. The mill in the meantime will be run if possible.

NEWTON COPPER MINE.—Some 10 or 12 men, all white, have been started to work at this mine, and are filing up preparatory to underground operations. Steve Moyle of Sutter creek is foreman. A boarding-house was started last Monday for the accommodation of the hands. Altogether everything wears a busy outlook around this property.

MISCELLANEOUS.—Martin Jones, president of the Amador gold mine, came up to Jackson from San Francisco last Saturday, to fix up matters connected with the mill-site purchased from the Amador Queen. A right-of-way has been secured over a small strip of the Doyle claim, but the mortgagees of the Amador Queen have yet to sign the deed conveying the mill-site.

LIVE OAK.—Amador *Dispatch*, June 30: The mill at Live Oak mine was started up last Monday to crush the rock taken out of that mine a sample sack of which has been left at this office, and looks to be a very high grade. The shaft is down about 180 feet with a ledge 18 or 20 inches wide and growing richer as they go down.

Calaveras.

GOLD.—Angels *Record*, July 3: We were shown a specimen that came from the Whittle mine, which looked first-class, it being covered with gold. About 200 tons of the ore is being hauled to Smith's mill to be crushed.

VOGT MINE.—Calaveras *Chronicle*, June 30: The Vegt gravel mine on the Mokelumne river, about three miles above the Big Bar bridge, upon which Mr. H. Vegt has been prospecting for about a year past, has, we understand, shown evidence sufficiently satisfactory to justify the erection of machinery, in the way of hoisting gear and pump, to operate upon it. We are informed that the machinery is now at Valley Spring awaiting transportation to the mine.

UTICA.—*Mt. Echo*, June 27: The boiler at the Utica mine was badly strained last Monday morning, necessitating the drawing of the fire from the furnace. Work was suspended in the mine for several hours, pending the repairing of the boiler. Everything is again running in full blast. Preparations are making at the Utica mine for the erection of the new hoisting works. The frame work will be 75 feet in height when completed, and will be the largest ever built in the county; 40 stamps more will soon be added to the 20 now in operation. The engine and boiler for the Confidence mine arrived during the week, and will be put in position as soon as practicable. The mill, we understand, will start up in a few weeks. Everything is progressing finely in the mine and a very good grade of ore is being extracted. Samuel Gillman will resume work on the Green Mountain mine, situated about three miles west of Angels. The ledge is now seven feet in width and prospects well. It is worked by means of a tunnel.

Fresno.

COAL MEASURES.—*Expositor*, June 28: C. D. Davis, from the Coast Range, reports that there is great excitement here in reference to coal. Prospectors are scouring the hills and valley in search of coal veins. They have discovered many indications, but as yet little has been done toward developing their finds. Coal and petroleum exists there, and indications are found in many places, but it will take time and money to develop the finds sufficiently to judge of their extent. The great trouble with the coal veins is in the manner in which they lay. Having been thrown up by upheavals of nature the veins stand on an incline.

Inyo.

PROSPECTING.—*Inyo Independent*, June 30: For some weeks past C. K. Fox has been prospecting in the foothills east from Independence station. Toward the end of last week he struck a ledge that is opening out big. The vein is now about four feet wide and gives every indication of being a large ore body. The ore is galena, carrying a high percentage of lead and a good deal of silver. Henry Galvin is interested with Fox.

LEAD.—During the past ten days there has been considerable advance in the price of lead. Miners who had quit work are resuming operations again. Whittier, Fuller & Company of Melrose, Alameda county, have sent orders for shipments to operators; they offer \$4.12 per hundred. The terms offered for silver are also a little better than for some months past. This is causing better feeling at the lower end of the county. The Haggin mine has been leased by Mr. Anthony. The mine is located 24 miles from the Riley mill and the ore will be hauled there to be worked. Several miners have been at work in the mine for some weeks past. Recently quite a body of ore was struck; assays give over 300 ounces of silver per ton. In the mine the ground is soft and will be expensive to work; timber must be hauled 50 miles. Mr. Anthony will go to the mine at once and intends to push the work rapidly. The district is in a mountainous and desert country about 100 miles southeast from the railroad at Keeler.

Nevada.

HIGH-GRADE ORE.—*Transcript*, June 28: There has just been crushed at J. C. Locklin's custom-mill a 20-ton batch of ore that yielded \$75 a ton. It was extracted above water level in a recently developed mine of this district, and there is plenty more equally good yet to be taken out. A few days ago one ton taken from another mine in the same neighborhood yielded \$90 worth of gold.

PROSPECTING.—*Grass Valley Union*, June 28: The prospecting work that is being done in the Brunswick mine is quite encouraging. The work of sinking a shaft on the Ford & Reilly ground (now the Oro Hill mine) is going on regularly. There is a great deal of work being done in the Omaha mine now, men being at work on all the levels from No.

5 to 10, either as tributaries or on regular pay. One of the most encouraging features of the work has been the finding of good pay ore in the north drift of the No. 6 level, where the finding of good rock had not been anticipated. The general appearance of the mine is encouraging. The water has been pumped out of the Lone Jack shaft to the depth of 400 feet, and it is being found a tedious and troublesome job, as owing to the mine having been idle for over 20 years there is a great deal of slum in the shaft, which is not nice material to handle. There is but little known in reference to the former working of the Lone Jack, and in pumping out the mine it is like exploring an unknown region. At the depth of 400 feet it is found that two shafts are sunk below, one following the hanging and the other the footwall of the ledge. It is not known how deep these shafts go, and relieving them of the accumulated debris is going to be slow work, but Supt. Mainhart will "get there all the same." The Lone Jack was once a good gold producer, and that the pay-shoot will be found again there is every reason to believe.

Plumas.

PLUCK REWARDED.—*Plumas National*, June 30: F. B. Whiting has been the owner of the French Ravine quartz ledge for years and has always expressed his unlimited faith in its richness. A short time ago he started a tunnel in the ledge, and last Monday he was rewarded by striking a rich vein, finding one piece valued at \$500, with indications of a permanent paying ledge.

GRAVEL.—*Plumas National*, June 30: Johnson and Richwine, on Mill creek, near Rich Bar, are taking out good pay. Horace Reynolds will push his tunnel for pay on Mill creek. He has just arrived from below with a large supply of provisions and mining supplies. Camille Girard, at Lower Indian Bar, on the North Fork, is making good wages. Whiting's French Ravine ledge is panning out satisfactorily. The big China company on Fale's hill, has suspended work for the want of water. Bennett & Morton, at Five Points, are cleaning bed rock with good results. Henry Orr and Hank Luman have struck a good streak of gravel at the Orr claims and are looking happy. Porter and Fogarty are driving their tunnel into Claremont, and expect to strike the "Blue Lead" in a short time. Dunk McDonald and Jno. August, on Mill creek, are regularly panning out the dust in paying quantities. The quartz mill at the Orr, Bushman & Co. mine, is progressing satisfactorily, and will be in running order some time next month, when we expect to hear of some good cleanups. Johnnie Higgins, at Michigan Hill, is prospering, and wears a smiling countenance, a sure indication of good diggings. Duncan & Patten have a force of men at work on the Ohio Point quartz ledge, running a tunnel, with every indication of a good paying mine. J. E. Mills still has a force of men on the Halstead mine at Rich Gulch. The 2000-foot tunnel of the Consignee Co., near Cromberg, is being pushed steadily ahead. There are about 12 or 15 men at work on the Plumas Eureka bedrock that are doing well. The Plumas Eureka is working about 250 men, and it is reported as paying better than at any time for 20 years. The old mine is inexhaustible. Johnson & Goodwin have suspended operations on the Middle Fork for the season, on account of the scarcity of water. Erichson and the Murdock brothers, on Waposisie, have good claims, and are in good paying gravel.

San Benito.

QUICKSILVER.—*San Benito Advance*, June 30: Six hundred pounds of quicksilver were shipped from the Gypsy mine last week. The miners are now working in ore that contains 75 per cent of metal.

San Diego.

SALE.—*Julian Sentinel*, June 29: Wm. Maher has disposed of a one-third undivided interest in the Fraction mine at Bonner, to David Edwards, for \$500; same to Thomas Rowan, same consideration.

STRUCK IT RICH.—On Tuesday afternoon last, Messrs. D. Ferguson, Ed. Armstrong and S. Ferguson marched into the office and commenced piling specimens of ore upon our desk. Upon examination we found the rock to contain considerable free gold, but when we asked where it came from the boys were suddenly taken with a severe attack of dumbness. They claim to have struck a good ledge, but refuse to give its location, saying "it's only a little way from here." The boys are highly elated over their discovery.

Shasta.

PROSPECTING.—*Redding Free Press*, June 30: Andy Woodward has returned to his home at Stella and resumed prospecting on Mad Ox Gulch. Lou Gross started up the country the other day to view some extensive deposits of fire clay that has been opened up near Slate creek; he found it in abundance, and of superior quality. This will be a great advantage to our growing city. Ed. Reid has resumed operations on the Samson mine, with a view to providing for campaign expenses. Messrs. Van Burgen, Thorne & Co., of San Francisco, have bonded the Kit Carson Mine on the Igo road for \$3,000. As they informed our reporter, they will go down one thousand feet if necessary to test the capacity of the ground, and they have the capital to do it.

Sierra.

A RICH QUARTZ LEDGE.—*Cor. Mt. Messenger*, June 30: The Buffalo mine, half a mile below the Primrose, in Hog canyon, I recently had the pleasure of visiting and was shown around by one of the partners, Mr. Lee. The public may be prepared to hear in a short time of it turning out to be one of the richest quartz ledges in the mountains. It is a most singular formation but prospects extraordinarily well from wall to wall, and is in width from 8 to 20 feet. The ledge is mostly a decomposed mass except where the white quartz starts like an immense honey-comb, and from the decomposed matter has been panned as high as \$12 to the pan in free gold, and in many pans from \$1 and upward, and in one I obtained 50 cents. The white honey-comb quartz that seems to keep the ledge in position is often spangled richly with gold, besides some galena and sulphurates. The dark, soft matter is full of small quartz crystals, and, in places, it might be shoveled out into sluices; and what would be taken in other ledges for scattered masses of porphyry here is the color of that with the consistency of clay, and might be dug out with a spade. The company have in a tunnel north on the ledge, 350 feet that prospects as favorably. A shaft was put down 50 feet, and on the bottom the

prospect was better. About 600 tons of rock from the tunnel and shaft are on the dump. The Buffalo company has consolidated with Henry Carpenter, who owned the south side of the creek and worked on and exposed the ledge, while mining in his claim for gravel, but did not know the fortune there was in sight. A lower tunnel, started near the creek, will tap their shaft and upper tunnel, securing good air and deeper backing. The ledge was reached with the lower tunnel the other day, and the rock prospects well. It is intended shortly to put up a 20-stamp mill.

THE BUFFALO MINE.—*Tribune*, June 29: Active work is going on at the Buffalo mine. Six men are employed there and they are pushing ahead the work with vigor. The upper tunnel has been run 350 feet and therein is opened up a splendid body of ore. No. 2 adit last Sunday was in 50 feet. It will take but a short time to run this tunnel a long distance into the hill, when it is safe to wager the owners will have something that will open the eyes of people. The prospects to be obtained throughout that mine are something immense. The writer can vouch for this as he was there last Sunday. The company is well satisfied with the condition of their property, and they propose as soon as possible to arrange for the building of a mill.

Siskiyou.

QUARTZ AND HYDRAULIC.—*Yreka Journal*, July 4: The San Francisco Co., operating the quartz mine at Gold Hill, Scott river, with Mr. Shepard as superintendent, have struck an extraordinary rich lead or seam, about two or three inches wide in the center of their ledge, which is over half free gold. Their mill of ten stamps, run by water-power is kept in operation all the time, crushing quartz from the main shaft to see what the average quartz pays, leaving the richest portion to be crushed separately, after taking out what can be secured by hand. It is reported the company intend adding more stamps to the mill in a short time. The Warren quartz mill, removed from Greenhorn and set up on Yreka Flats, just west of town, is now in running order, and a portable steam engine used for threshing, was hauled to the mill last Thursday, so that it will be in readiness for crushing just after the 4th. It will be operated by H. B. Green, giving all the quartz miners of Yreka and vicinity, who have good ledges in the Humboldt mountains west of here, a good opportunity to thoroughly test their claims. Hon. R. H. Campbell is now winding up the working of his hydraulic claim in Quartz valley as water is getting short, and will make a final cleanup in about two weeks. He has had an excellent run this season, with good returns, and the prospects look more promising for future seasons, with the additional facilities for working on a more extensive scale than heretofore. The old Steamboat mine on McAdams creek, now owned by a San Francisco company, is being worked on a large scale, employing many miners in drifting and other work. A new shaft has been sunk and the water kept pumped out by means of the regular 25-horse power engine assisted by a donkey engine. A new boiler is also on the way to replace the old one, not able to stand as much steam as the engine can carry. Some fine prospects have lately been taken out of the Sorrenson quartz mine on Indian creek, now owned by John Stewart, which averages generally about 338 a ton. Geo. Baker of Indian creek is in the town and showed us some exceedingly rich specimens from his claim. He has found an old channel of the creek, 70 feet wide, filled with cement, gravel, ground up boulders and quartz, which requires crushing in a quartz mill. For some months past he has been digging a cut to drain the water by connecting with an old tunnel built in early times, and is now able to work the claim with the greatest success. He had eight tons of this conglomerate crushed last week and realized \$13.06 per ton, but some of the specimens found are nearly half gold, plainly visible to the naked eye. The indications are favorable for finding very rich pockets all through the channel. Messrs. Martin Squiers and Chas. Taylor have also found very rich prospects in their quartz ledge on Indian creek and will soon take out a big stake, which their industrious perseverance eminently merits. Weldman & Co., of Greenhorn own a very rich quartz ledge from which they have 100 tons or more on the dump. They pay all their expenses by simply pounding out quartz occasionally in a hand mortar. A few weeks ago they sold a fine specimen for \$125 to a San Francisco man stopping at the Franco, and refuse to sell out for less than \$50,000, offers having been made to bond the mine for \$20,000. This claim is almost within sight of Yreka, and the hills surrounding us on the north and west are full of rich quartz ledges if the proper effort is made to develop them.

Tuolumne.

FINE ORE.—*Union-Democrat*, June 30: It is reported that the Platt and Goulson mine is sending forth some very fine ore. Solsburyville is surrounded with good and profitable mines. Messrs. Cullers and Ewart are re-opening an old quartz mine on the Mono road near the Excelsior hotel. We are told that present appearances indicate a good property. McTarnahan and staff went up last week to survey the North Fork mine, and also ditch to convey water to the grounds. Operations will very likely be commenced on the mine soon after the Fourth. From Mr. Scott who was in town Thursday, we learn that the hoisting works will be done in about three weeks. Then the work of sinking the main shaft will be prosecuted at once. The permanent character of the Black Oak mine is now well established, and present returns from the mill are of a most gratifying nature.

HYDE.—From Louis Blanding who returned from the Hyde mine Thursday, we learn that the outlook is very bright. The main shaft on the large lode is down to a depth of 350 feet. At that depth a cross-cut has been run toward the west, showing the lead to be fully 26 feet in width and of very good grade. The parallel ledge is also looking well—it is from 3 to 5 feet in width and a tunnel taps it 100 feet from the surface. This lead is distant laterally from the main one about 150 feet. The ore of this lode is of high grade. About 200 feet south of the main shaft on the large lead, another shaft is being sunk for development purposes. The work of exploration done on this mine in the last three months has proved it to be a splendid property. The mill which is of the improved Huntington pattern is furnished with the blinding rock breaker, which by reason of it crushing the rock very fine, enables the mill to have a capacity of 25 tons per 24 hours. There are two separate engines in the plant, one of which runs

the hoisting works, and the other operates the mill. A feature worthy of notice in the machinery department is the boiler. This is a novel combination of the locomotive and tubular boiler, and gives great satisfaction.

NEVADA.

Bristol District.

COPPER BULLION.—*Pioche Record*, June 30: The small copper furnace at Bristol, erected recently by C. L. Roe, and of which mention was made some time since, was fired up a week ago yesterday, and a three days' run made, the result of which was seven tons of bullion, containing 95 per cent copper, produced from 14 tons of ore. The bullion carries but \$2 per ton in silver. This experimental run resulting successfully, the furnace will be fired up again as soon as it is relined, which, however, may be some weeks, as it may be necessary to procure fire-brick from Salt Lake City. In the mean time ore will be hauled to the furnace from the mine. About 200 tons of ore are mined and are now on the dump.

Cherry Creek District.

WAITING FOR A RAILROAD.—*Salt Lake Tribune*, June 28: Forty-five miles south of Spruce mountain is the well-known camp of Cherry creek, on the line of the old Overland Stage Co. This camp has shipped \$3,000,000 worth of ore. The ores are principally milling ores. The bulk of the mineral is silver, but there is a sprinkling of gold. Below water level the character of the ore changes to base ores, yet running very high in silver and lead, streaked heavily in chlorides. There are thousands and thousands of tons of ore in this camp on the dumps waiting the advent of a railroad to ship them to market.

Garfield District.

THE ARGO.—*Esmeralda News*, June 30: Z. Lyford has been doing the assessment work on the Argo mine, and while so engaged extracted 28 sacks of ore, carrying both gold and silver. Six sacks of the ore are considered very valuable and will be shipped to Selby's for reduction. The other 22 sacks of ore will be worked at the Mt. Diablo mill, Soda-ville.

Hawthorne District.

RICH ORE.—*Esmeralda News*, June 30: The figures \$16,780, show the result of the working of the 15 tons of Pamlico ore crushed at the Kinkaid mill last week. In the last issue of the *News* it was asserted that the result of the working of this batch of ore would "surprise the natives," and if it has not surprised them it certainly ought to. Just think of it, over \$1112 per ton, and the beauty of it is, there is a quantity of the same class of ore in sight in the mine, only awaiting the action of the pick, shovel and stamps. As has been stated all along, the Pamlico is the biggest little mine in the United States, and it is only a matter of time before other mines equally as valuable will be in operation in Hawthorne district. If many of our prospectors had the capital with which to open up their mines, such a stream of gold would be flowing out of Hawthorne district that would soon fill the coffers of many a poor man. As it is, the mines in the district are producing admirably well. One prospector, who has been at work on his claim but a short time, was made an offer of \$7000 for his interest, but he quickly refused the offer, saying that there was that amount of money in sight in the mine.

Tuscarora District.

IMPROVEMENTS.—*Tuscarora Times Review*, June 30: Tuscarora is now on the high road to prosperity and is bound to become one of the most permanent mining camps in the State of Nevada. The developments during the past year in the 400-foot level of the North Belle Isle, as well as those in the lowest levels of contiguous mines, from the deepest point yet reached and extending upward to the surface, have attracted the attention of capitalists from abroad who have invested largely in shares in the leading mines. Having upon several occasions visited Tuscarora in the interest of their investments and to note the developments below ground, they have become fully convinced as to the extent and richness of the ore bodies as well as their permanence. Being far-sighted, practical and competent business men, they foresee that the population of this place will be greatly augmented and as a consequence its needs increased in a corresponding ratio. To remedy the lack of facilities for reducing the large bodies of ore in their mines, the Commonwealth and Queen companies are about to erect a 20-stamp mill in the vicinity of their mines, which will be equipped with the largest and latest improvements in the way of roasting appliances for desulphurizing their ores and reducing the cost of reduction to the minimum. When completed it is thought the mill will reduce the ores at a cost not exceeding \$12 per ton. The site selected for the mill is upon the eastern slope of the Commonwealth property above the Diana hoisting works in Independence gulch, and ground will be broken for the buildings in a few days. The concentrating works of the North Belle Isle and Queen, now in course of construction, will materially add to the wealth and prosperity of the mines and the camp by rendering available the immense number of tons of low grade ore now lying useless on the dumps and in the stopes of all the mines which have been worked for any length of time, and which under the ordinary process would not pay for extracting and working.

Washoe District.

ALPHA.—*Virginia Enterprise*, June 30: The work of sinking the shaft to the 500 level is making good progress.

OVERMAN.—Are extracting and shipping to the mills 300 tons a week.

BULLION.—The south drift from the 600 station is making good headway.

CON. IMPERIAL.—Are making good progress in the work of retimbering the north lateral drift.

ANDES.—On the 240 level are sinking a winze below the north drift and are drifting south on the 350 level.

BENTON.—Considerable prospecting work is being done on the 725 level. The mine is being worked through the Alta shaft.

SAVAGE.—On the 450 level are stopeing ore from the north and south drifts, also from the south drift on the 500 level. They are extracting about 80 tons of ore per day from between the 400 and 900

levels. The average battery assays \$20 per ton. They have bullion on hand and previously shipped for this month amounting to \$20,350.

CHALLENGE.—The joint Confidence raise is progressing favorably and good headway is making in the north drift on the 100 level.

SCORION.—The south drift on the 300 level is out a distance of 353 feet. The material is about the same as heretofore reported.

ALTA.—Are extracting ore from the usual point. The mill and concentrators are kept steadily running. The concentrators are doing good work.

UTAH.—372 level: Opposite the south drift the north drift has been extended 38 feet; total length, 116 feet. The formation is vein porphyry.

BEST AND BELCHER.—El Dorado level—The northwest drift from the main west drift has been extended 46 feet; total, 336 feet, the formation being porphyry.

BALTIMORE.—The work of clearing out the west drifts on the 300 level is about completed. The point where ore was found some months ago will shortly be reached.

WEST YELLOW JACKET.—The northwest drift is in 80 feet. At the bottom of the drift a stratum of blue clay is coming in. In this clay are some rich streaks of chloride ore.

IOWA.—During the past week the south drift from the east drift has been extended 25 feet, giving it a total length of 100 feet. The face is in promising vein material in which quartz predominates.

LADY WASHINGTON.—The crosscuts at points 110 and 210 feet above the 725 level are still in a mixture of quartz and porphyry. A hoisting engine is being set up at the Keystone shaft, which is now down 186 feet.

SEG. BELCHER.—The joint 1300 east drift has been stopped since last report, and a raise started in the south lateral drift from the first raise at a point about 100 feet south of the north line. It is now up nine feet above the top of the drift in fair grade ore.

BELCHER.—The west crosscut on the 500 level is in 35 feet. The face is in clay and porphyry. On the 1300 level the east drift has been stopped. The new hoisting works at the old shaft are nearly completed. They expect to commence work in the shaft about July 1st.

GOULD & CURRY.—Eldorado level—The southeast drift from the top of the upraise from the drain tunnel has been extended 37 feet; total length, 154 feet. This drift is in fair grade milling ore. During the week there has been extracted from the 250 and 300 levels and shipped to the Douglass mill 216 tons of ore; average battery assays, \$23.40.

CROWN POINT.—On the 600 level the raise has been advanced 22 feet. The ground is of about the same character as at date of last report. On the 700 level the southeast drift has been advanced 44 feet; total length, 132 feet. The face is in quartz giving low assays. The quartz is a good deal mixed with porphyry. The drift from the Suro tunnel side is out 300 feet.

HALE & NORCROSS.—During the week they have hoisted 1647 tons of ore from the 600 and 700 levels, and have shipped to the Mexican mill 951 tons; average battery assays, \$32.65. All the stopes throughout the mine are looking very well. No. 1 east crosscut from the 400 level north drift has been advanced 45 feet. They have bullion on hand and previously shipped this month amounting to \$135,200.

OCCIDENTAL.—Upper tunnel: At 150 feet below the upper tunnel in the boiler winze the north drift has been extended to feet; total, 18 feet. Lower tunnel: 75 feet south of the north incline winze the incline upraise has been carried up 20 feet; total, 120 feet. At 150 south of the same winze the south drift has been extended five feet; total, 114 feet. In the winze leading to the lower levels, 50 feet below the tunnel, the north drift has been advanced in feet and the south drift six feet. Extracted 134 tons of ore. Shipped to the Excelsior mill 157 tons and to the Atlanta mill 139 tons. Average assay of wagon samples, \$22.25.

PALMETTO DISTRICT.

LEACHING PLANT.—Inyo Independent, June 30: At Palmetto, over in Esmeralda county, Nevada, a new leaching plant is being put up. Cornish rolls will be used in connection with pans and settlers. It is calculated to work about 15 tons of ore per day. The property is owned by the Catherwood Bros., bankers, of New York. Some very rich gold ore has been taken out. From a claim called the President, Mr. Catherwood, one of the proprietors, recently took a sample of the ore to San Francisco. The sample weighed 93 pounds and yielded \$407 in gold and \$15 in silver, or \$9773 per ton. At the mill and mine 30 men are now employed. The boilers and engine are in place and it is expected work will begin crushing ore about three weeks hence. Palmetto is about 47 miles distant from Alford on the C. & C. railroad, and 16 miles southeast from Piper's ranch.

ARIZONA.

EUREKA DISTRICT.—Cor. Arizona Journal-Miner, June 30: This district is situated about 65 miles west from Prescott, and near the divide between Santa Maria river and Burns creek. The mines of this company, Walters, Smith, Rybon and Wilson, are 12 in number, and situated on the top of the mountain near old Gray Back. The mines of this company are all grouped together in the foot-hills among the cedars, close to a never-failing spring of water, good grass, and easy access by wagon road, close to the big copper property of Lawler & Co., on Copper creek, and on the same mineral belt of the celebrated Hillside mine of Riggs & Lawler, the belt being encased between two large dykes of copper, the one on the west being a good strong vein of copper, carrying from 20 to 30 ounces of silver, owned by John Long and called the Copper Queen; the one on the east being a big ledge of copper and silver, owned by W. N. Kelly, Fred Gaines, and Morrow & Caldwell, and is a fine prospect, carrying copper, silver and lead. The mines of Waters, Smith, Rybon and Wilson had been partially developed by Mr. Waters, the locator, before the Colonel took hold of them, and who induced Mr. Rybon and Wilson, of your city, to take hold with him and bring them to the front by further development, and testing the ores by shipping and reducing them, thereby proving to their own satisfaction the exact value of the mineral therein contained, and from the present outlook of the quantity and quality of the

ores their labors will meet with a reward far beyond their expectations. They are now working seven men, sinking and taking out ore and sending it to the Prescott sampler. Ten thousand pounds will accompany this letter. There are three of the mines that are being worked at present—Silver Queen, Wilson and Hamer. The Silver Queen has a shaft down 80 feet on a strong contact vein, the contact being porphyry and diorite. It is a sulpho-carbonate of lead, carrying from 50 to 100 ounces of silver, and from 20 to 40 per cent of lead. The pay streak is from 18 inches to 3 1/2 feet. The Wilson is a continuation of the same, adjoining the Queen on the south, with a 60-foot shaft of the same ore. The Hamer and Gad has a 30 foot shaft of a higher grade of lead, though not as yet so much in silver, it going about 4 ounces of silver and 60 per cent lead, with a good, strong vein. The ore dump is a beauty to look at, and is increasing very fast as they sink. This belt will be the coming camp of the northern part of the Territory soon. Fred Maroney is working on the Red Cloud, with a good showing of galena ore. Several prospectors are here, and you need not be surprised to hear of some new strikes soon.

BULLION.—Arizona Enterprise, June 30: On the 26th, the Vekol shipped three bars of bullion, averaging 444 pounds, valued at about \$700.

CASA GRANDE.—Another mine in the Casa Grande mining district has been sold to Eastern parties, and Chris. Johnson is the lucky man this time. Chris, has worked long and faithfully to bring the Golden West mine out to the front, and his late strike of a fine body of chloride ore in the crosscut is another chinch for the mines in that district go down. Mr. Charles Eastman is in Casa Grande from his Mountain Queen mine near the Vekol, and reports the tunnel in 265 feet, with abundance of ore. Eastman and his partners will soon commence shipping ore to El Paso. Mr. J. A. Conlee, superintendent of the Monarch mining company, came up from Casa Grande and went to Riverside Wednesday. A rich strike is reported in the face of the 220 foot tunnel on the Silver Monarch mine. This mine is the coming bonanza of Pinal county.

COLORADO.

LAKE CITY MINES.—Sentinel, June 28: The Oneida Chief, owned by Reynolds Bros. was started up June 1st. The assays taken are said to average about 1000 oz. Considerable work will be done on the property the coming season. A large force will soon be put to work on the Montecello, owned by Reynolds Bros. Ulica, N. Y., and managed by H. E. Wright. A crosscut of 150 feet will be run, which will give employment to a large force. The Park View people have stopped sinking and begun a crosscut tunnel at a depth of 50 feet. This is a very valuable property, and a large force of men will be put on at once. The "Seward County" mine, owned by T. E. Clauson, is expected to resume operations soon, as Mr. C. has determined—now that the D. & R. G. R'y has begun to build—to put a large force at work and develop this unusually valuable property. E. B. Coleman is one of the owners of the Hamilton mine in Carson camp and is here to make some examinations, with a view to putting on a large force at once. This property is one of the richest in that locality. Over 15,000 tons of ore was taken out last season which averaged over 1000 ozs. The ore output of Lake City, beginning with the completion of the D. & R. G. R'y, say Oct. 15 to the end of the year, is estimated at fully 30,000 tons, possibly more. It is astonishing to notice the amount of ore taken out and awaiting shipment. Lake City certainly has the largest and richest mining territory tributary to her of any camp in the San Juao. The developments this season will be extensive and add greatly to the output of the camp. Good buildings have been erected at the mine, including a spacious engine house. They have a 15 horse-power boiler, pump, hoister, and other machinery. Much more is to be added and it would not surprise us to see the Hamilton become one of the heaviest producers of high-grade ore in the State.

DAKOTA.

GRAVEL.—Pilot, June 28: M. R. Phillippi and Lou Wintenburg came down from where the Hermosa Hydraulic Co. is working on Monday, and report that the two weeks' cleanup, which occurred Sunday, amounted to \$400. But few realize that so much money is being taken out of the ground within a few miles of Hermosa.

PLACERS.—Deadwood Pioneer, June 28: Placer miners have had no reason to complain of an insufficient supply of water this season. All streams have run bank full for the last three or four weeks, and the supply of water has been all that the most exacting gum-boot miner could desire.

IDAHO.

PINE GROVE.—Inter-Idaho, June 28: We obtain from Mr. John M. Banfield some figures relative to the present prospects of Pine Grove, and what it really is now, that represent the present actual condition of affairs there, from which every one can deduce their own ideas of its future. Pine Grove is one of the mining camps which are not "coming," but has already come. The population numbers about 200, and there is one 20-stamp mill. The company employs about 70 men, and need more machinists and carpenters. The Gold Hill M. & M. Co. is composed of St. Louis men. They expect to start the mill in three or four weeks. Frank Andrews is running the Franklin mine and shipping ore to Rocky Bar. The ore goes from \$40 to \$90 gold. Sloan has leased the Valley Buck, and is taking out high-grade ore. The mines generally are all looking well and several are shipping ore.

THE VENUS MINE.—Wood River Times, June 27: Vladislav Domsli, from the East Fork of Wood River, says he is being doing deadwork since last fall, but that he is now in where he can soon begin extracting ore. After running the tunnel 190 feet he cut the vein and found it quite hard, but showing a streak of copper 1 1/2 inches wide. By drifting about 50 feet from this point, he expects to cut the continuation of the ore chimney struck above, and which yielded high-grade ore. He will then begin stopping as soon as the vein is drained.

ROCKY BAR.—Cor. Idaho Statesman, July 1: The mill and other buildings on Red Warrior gulch are going up speedily and they look well. This is

the Wide West property, destined to be an important factor in determining the prosperity of this camp. The Idaho lode is one of the oldest in this camp and runs parallel with the Vishnu. It has not been worked until recently for many years. Mr. Fitzgerald, one of the proprietors, struck a fine body of ore there on Monday of last week. The Ophir mine is getting out seven or eight tons of very promising ore each day. The superintendent, Mr. Foljamber, will have a mill test of from 60 to 75 tons made within the next fortnight at Jake Reeser's mill. If this should be a success, the New York company will at once proceed to put up a mill. The force of men at work upon this lode has been small thus far.

ORO FINO.—Idaho Avalanche, June 30: The purchasers of the Oro Fino group of mines have registered in London under the name of the Oro Fino Limited Co., by which name this famous group of producers will hereafter be known. Judging from the way the owners are pushing matters Silver City will soon be a lively camp. The superintendent here is quite reticent about what the company proposes to do, but the fact that a new millsite has been located in town and the work of preparing the same for a mill been begun, 1500 cords of wood advertised for, and bids for hauling 150,000 pounds of mill machinery asked for, tells more than talk. We learn that he is also making arrangements to put up a bucket tram to transport ore to the mill from the mine, 1 1/4 miles distant.

SALE.—It is too early yet to learn the particulars, but we take pleasure in announcing that a sale has been about consummated here almost equalling the Oro Fino transaction made a few months since. The famous Poorman group of mines, some 12 in number, among which are included the Belle Peck, Belle Peck Tunnel, Poorman, Silver Cork, North Empire, Oso and others, by this sale will pass into the hands of a syndicate of English capitalists, who will at once begin to work them for all they are worth. This great combination of mines, placed under one management, with abundance of capital, will be likely to make things very lively on old War Eagle mountain.

SEAFOAM.—Cor. Idaho Messenger, June 30: Many of our own people, as well as many of the strangers, have gone into the Seafoam country. That seems to be the objective point this season. The reports from there are very favorable as to the mining outlook. A large proportion of the old discovered quartz veins there are owned by men in this vicinity, either by purchase or discovery, and we are all more or less interested in the success of that end of Custer county. Its distance is only 30 to 40 miles from Bonanza, over a fair mountain trail. A large number of prospecting parties have purchased supplies at Bonanza and Custer for the new El Dorado. It is understood that arrangements have been made with the Dickens-Custer Co. to work the milling ores that may be brought in during the summer from the Seafoam and neighboring districts. All who return from there speak in glowing terms of the prospects of the new camp. Recent explorations on a number of the claims, prove that the ore veins are not confined to mere surface croppings, but that they go down in regular veins of rich ore, and can be traced over the hills from one location to another.

MONTANA.

RETURN OF GOLD HUNTERS.—Inter-Mountain, June 25: "Punk" Bartlett and Lyndon got back from the north last night, and Doc Gleason will be in with the team some time to-day. Boyles, who led the expedition, returned with him. Bartlett says they did not succeed in getting to the rich diggings which Boyles told them of, where they had expected to find placer mines which would enrich them in a few weeks. They got away up into the northernmost part of the territory and may have been across the line into the British possessions. At any rate they got where the Indians were altogether too numerous for their peace of mind. They were placed under surveillance by the Piegans and required to report twice per day. They were practically under arrest and were not permitted to proceed on their way. There was no use staying where they were, as they could do nothing there and were in danger of losing their stock, so they turned back. They are still firm in the faith that a golden land lay just beyond, and may perhaps make another attempt at some future time.

CASTLE DISTRICT.—Butte Inter-Mountain, June 30: The Castle mountains lie south of White Sulphur Springs, between the heads of Smith river and the Musselshell. The mines are located on the Musselshell side of the group and extend over a distance of seven miles.

THE TOWN OF CASTLE contains about 100 residences and business houses and is about two miles below the Cumberland mine, the original discovery of the camp, which was taken up by the Hensley Bros. in 1886. Very little was known of the camp until August of last year. Since that time over 400 locations have been recorded and a large amount of development work done. The Cumberland Mining and Smelting Co. developments are two shafts—one 125 feet deep and one 150 feet deep, with levels run for a short distance and show a fine body of carbonate ore. Returns from a shipment made to the Aurora smelter netted them \$30 per ton. The general run of their assays vary from 25 to 35 ounces silver and from 40 to 65 per cent lead. They are now at work grading for their smelter, the machinery for which was shipped by Frazer & Chalmers of Chicago, on the 19th of this month, and if they get clear weather enough will soon have a 40-ton stack running at home. The American, owned by Hensley Bros. and J. D. Rhoades, is really the only dry ore yet struck in the district. Developed by a tunnel 150 feet on the lead and a shaft down 40 feet they have a three-foot contact vein between slate and granite, and have had no assay of less than 150 ounces. Several extensions of the American have been located, but no development work has yet been done. The Yellowstone, owned by Hensley Bros., located about one mile from the new town of Robinson and three miles from Castle, is a contact vein between lime porphyry, and development shows a very large body of about the same grade and character of ore as the Cumberland. This mine is under a bond to Helena parties for \$50,000.

THE HIDDEN TREASURE, a quarter of a mile from Robinson, owned by Dunn & Donovan, have a shaft down 100 feet and have a very fine ore.

THE GREAT EASTERN, owned by Chapin & Lewis, have a shaft down 200 feet. At many points

of the shaft short levels have been run and all show a fine body of ore, the same character as that in the Yellowstone and Corliss.

THE T. V. POWELL, owned by Hensley Bros., Higgins & Chaffee, is developed by a tunnel 120 feet to the top of the lead at a depth 80 feet. It shows a carbonate ore which carries from 25 to 100 ounces of silver and 30 to 40 per cent of lead.

THE SHANROCK, owned by Graham & Currie, one mile from Robinson, is developed by a shaft 50 feet deep; have a three-foot ore body carrying galena and silver from 30 to 50 ounces.

THE MOTHER LODE, owned by Martin & Orschall, has a shaft down 50 feet and quite a large ore body, which assays from 50 to 70 ounces of silver, 50 to 60 per cent of lead and one-half ounce of gold. Very few of the prospects here show any gold. The Belle of the Castles and the Blue Belle, Black Hawk, with a number of others, have a fair showing for the amount of development work done.

THE ALICE, located 12 miles from Robinson toward the springs, is certainly one of the best properties in the district. It is now being operated by the Barker & Davis, under a lease and bond for \$100,000.

NEW MEXICO.

BANNER.—Silver City Enterprise, June 29: The Banner mine gives promise of making one of the big mines of this section. The ore has been continuous and occurs in large bodies. The development is progressing steadily. Malcomb McGregor brought over 60 tons of third-class ore from the Boss mine this week, which was worked at the Bremen mill with satisfactory results. J. B. Malone was from Pinos Altos this week making arrangements to go down 35 feet further on his claim, having already sunk 90 feet. It is probable that in the near future the Bremen mill will pass temporarily under the control of the Aztec company, and will be run on ores from the Aztec mines. Messrs. Crawford and Milstead contemplate giving the mill up in a short time, as they are running short of ore. M. W. Bremen has purchased the Wynan interest in the Yankee Girl, at Gold Hill. The mine is now owned by Goodwin and Bremen. It is one of the finest prospects in the whole country, and will, no doubt, prove to be a payer. George Goodwin will have charge of the development of the mine. Last week Jake Long struck a 15-inch vein of ore in the Osceola, a northern extension of the Deep Down, at Pinos Altos, which is very rich in free gold. A good portion of the vein will average about \$1000 per ton, while the whole of the vein is very rich.

PLACERS.—Silver City Enterprise, June 29: The placers which were spoken of last week as having been recently struck in some part of the Pinos Altos mountains, have been located on Bear creek just below the mouth of Webster gulch, hence, the location is no longer a secret. Old timers have washed gold there before. The dirt pays about ten cents per pan, which is quite good. The gold is heavy and of a splendid quality. The boys who have the placers located are taking out water, and fortunately they have a sufficient amount for present purposes, and are preparing for a season of active work. The information that M. W. Bremen has been made agent for the Bremen Mining Co., will be gratifying news to many people of this section, as it foretells the resumption of operations in the Bremen mine. Quite a force of miners will be put to work as soon as the right class of men can be secured.

TO START UP.—The Telegraph mines on the Gila river will be started up by the new company as soon as preliminary arrangements can be settled. Five more stamps will be added to the mill, making 15 in all, and a wire tramway will soon be erected to convey the ore from the mines to the mill, which has heretofore cost \$7 per ton to haul. The mill is run by water power, and as the ore occurs in large bodies, it has been estimated by good authority that eight-ounce rock can be mined and milled at a handsome profit.

OREGON.

RICH STRIKE.—Bedrock Democrat, June 27: A. Geiser came in from Connor creek yesterday. He reports a rich strike having been made in the mine at that place two or three days since. Mr. G. says that the new find is a vein of ore four feet thick, and that the gold fairly glistens all over and through it. The Connor creek is and has been one of the "big" mines of Oregon for some 12 or 15 years.

WALLOWA MINES.—The mines of the Wallowa are assuming considerable prominence to mining circles. The principal property of that section is the Wallowa Silver Mining and Tunneling Co., under the general management of T. L. Brophy, an experienced and practical miner. Work has been in progress on this mine for the past 10 months, and the developments thus far are beyond the most sanguine expectations. The main tunnel is in about 200 feet and there are 500 tons of ore on the dump. Assays average all the way from \$70 to \$2000 a ton. Two carloads of the ore was shipped to Portland a few days since and awaits reduction.

UTAH.

REVIEW.—Salt Lake Tribune, June 29: There has been a slight relief in the lead market, which has brought ores in freely during the past week, but the improvement in price was so small that there is scarcely any relief in the general gloomy feeling. The ill gal importations of Mexican lead ores are what make the main slaughter of the market. The receipts in this city for the week ending June 27th, inclusive, were to the value of \$199,654.18, of which \$103,217.27 was bullion, and \$96,436.91 was ore. For the previous week the receipts were \$71,976.19 in bullion, and \$49,794.28 in ore, a total of \$121,770.47. The output of the Ontario for the week was of bullion, 17,283.40 fine ounces; from ore sales, \$22,863.62; total, approximately, \$40,147.02. The Daly product for the week was bullion, 19,645.99 fine ounces. Fine bar receipts in this city for the week were to the value of \$63,794.80; base bullion, \$23,008.60; copper matte, \$3246.05. The Hanauer smelter produced for the week bullion valued at \$11,280; the Germania, \$8622.44. Ore receipts in the city for the week were to the value of \$55,578.54 by Wells, Fargo & Co.; \$31,650 by McCormick & Co., and \$9208.35 by T. R. Jones & Co.

MECHANICAL PROGRESS.

Progress of American Iron Industries.

Mr. Swank's last annual report of the industries of this country is awakening a most lively interest in the activities of this country, throughout Europe, and particularly in Great Britain. The *English Colliery Guardian*, in alluding to the facts set forth in that report, says that "the progress of American industry is one of the most striking facts of modern times. No country has ever developed her internal resources so rapidly before. Particularly is this the case as regards minerals and iron and steel manufacture."

"Mr. Swank's figures," the *Guardian* continues, "demonstrates that the United States continues to lead the world as a producer of Bessemer steel." The circumstance that the demands of the railroads in America for iron keep very heavy, and that in England steel for shipbuilding has largely superseded iron "efficiently," remarks this authority, "accounts for the relative positions of the two processes (the Bessemer and the open-hearth) in the two countries."

America's steel rail production the same critic denominates as "a most striking fact" the circumstance that the steel rail production of the United States at the present time is more than twice the extent of its output in our own works, and concludes: "The position which America has attained as an iron and steel and mineral producer should not be cause wholly of envy, but rather of admiration, for is not America the child of the mother country?"

The British Iron and Coal Trade Review comments upon "the wonderful advances which that great country (America) has made in recent years in the manufacture of iron and steel, and in that spite of the fact that it has practically no export business such as ours. But up to the present the United States has not felt the need of an export trade, as within its own territory there are consumers for all the iron and steel that is made there, and a good deal more besides."

"Mr. Swank has a surprising record to present," continues the Review, "as to the increase of the trade of 1887, which was undoubtedly the most active year that the American iron trade has ever experienced. The year 1886 was counted a wonderful period, but 1887 far exceeded it, and in no leading industry has such marked progress ever been recorded as is now reported in connection with the iron and steel trade."

"One thing," says the editor, "in this return is very remarkable—it is that in face of the vast increase in the consumption of steel the output of rolled iron should increase. This would show that the puddling furnace is more than holding its own against the encroachments of steel."

MANOANESE STEEL VS. IRON.—The proposed introduction of bolts and nuts, bars, plates, etc., from a tough, soft, manganese steel, in place of iron, has met with much favor, their alleged superiority having been abundantly proved. In London some interesting tests of a severe and decisive character have been made, with a view to ascertain whether bolts of such material were really strong against the very heavy stresses and strains to which they are sometimes subject in practice, and to determine whether the steel of which they are made would withstand bending, hammering close, and severe treatment in various ways, or whether the steel would only withstand heavy stresses slowly applied. Under these trials the metal exhibited a toughness unsurpassed by any other, being easily nicked and bent round away from or closed up at the nick. Bolts up to $\frac{5}{8}$ -inch were tested by holding the nut fast in a vice, and then hammering the bolt until it was bent down at the screwed part through an angle of 130°, then taken out and doubled down and closed up with a heavy hammer on an anvil; but though the screw threads were thus jammed up and compressed upon each other on the inside of the head, and opened out to double their pitch on the outside, the steel did not break. Its value for piston and other rods, and also in slabs for forging and welding into screw propellers for torpedo boats, likewise seems assured.

DRAWING CANAL BOATS WITH A LOCOMOTIVE.—The experiment of drawing canal boats with a locomotive engine was recently tried by officials of the London & North Western railway with great success. A short track of eighteen inches gauge was laid along the tow-path of the canal and a little locomotive weighing about a ton, drew a number of boats at the speed of six or seven miles an hour with ease. There are still a few canals left in this country upon which the substitution of the locomotive for the mule might be tried to advantage.

RUSSIA IRON.—Probably the only secret process which has been kept inviolate, and for ages openly defied the world of science, is the iron trade of Russia. The secret of making Russian sheet iron is owned by the Government, and is such an immense monopoly that it is currently supposed to defray the entire expenses of the Government. The works constitute an entire city, isolated and fortified against the rest of the world. When a workman enters the service, he hides a last farewell to his family and

friends, and is practically lost to the rest of the world. He is never heard from afterward, and whether he lives or dies, all trace of him is forever lost. There have been several desperate attempts made to steal or betray the secret, but in every instance it has resulted in the death of the would-be traitor. In one case a letter attached to a kite, which was allowed to escape, was picked up by some peasants, and, despite their protestations that they could not read, they were at once put to death by the guards to whom they delivered the letter, and it was afterward decreed that the guards themselves should pass the remainder of their days within the works. The wonderful properties of this iron are so well known that it is unnecessary to enlarge upon them.

Superseding Steam.

A Novel Application of Naphtha.

A test, says the New York Herald, was made on the Harlem river on Thursday last of an invention which, it is claimed, will furnish speed for small craft without steam, and with an entire absence of heat and dust. It is well known that the loss of energy is less in liquid fuel than in coal, the only difficulty in the way of utilizing the former being its volatilization and the danger of an explosion. The invention in question, and in which naphtha is used both as motive power and fuel, claims to have overcome these difficulties.

In the how of the boat a hulkhead is perforated to admit sea-water, which circulates around a copper tank fitted with a tap screw. In this magazine liquid naphtha is stored, and from the reservoir a feed and two exhaust pipes lead to a retort and, to another hulkhead, which contains the mechanism. The engine and boiler consist of a series of spiral coils, beneath which is the steam chest, vertical cylinders and piston rods. Forward of the retort is an injector which feeds naphtha vapor to the furnace, and a damper admitting fresh oxygen to aid consumption. By this arrangement the pressure of gas is increased or diminished, and the speed regulated. At the lower end of the retort is the combustion chamber which admit the vapor. When ignited the flame reaches every part of the spiral, boils the naphtha, and generates a pressure of 60 pounds per square inch in a few minutes. Only about six per cent of the gas generated it consumed as fuel, the remainder, after being utilized, being condensed in the exhaust pipes and entering the reservoir again as liquid naphtha. The engine, after being once started, runs itself as long as there is a supply of naphtha in the tank, and as the feed fails to supply liquid the fire goes out automatically, and there can be no explosion.

The launch on which the test was made was 30 feet long, and designed to develop six-horse power. At a pressure of 60 pounds a speed was gained a little under eight knots. The boat consumed about two gallons of naphtha an hour, which at the market value to-day is a cost of 20 cents. Any person can learn to run one of these engines and to steer at the same time. The entire engine and fittings are less than one-fifth the weight of others of the same power, and occupy a comparatively small space. Besides this, there are no cinders or ashes.

BULL'S METAL.—A new malleable alloy of the bronze kind has been produced by Mr. John Bull of London, by a process for which it is claimed that it secures the introduction and admixture of the component metals in accurately controllable and definite proportions, forming true alloys of high strength and uniformity. Some of the specimens of cast, rolled and turned rods show remarkable uniformity in extension throughout the whole length of the test part, and not so marked a contraction in one spot only, as is usual. In one of the test specimens the elastic limit was reached at 24 tons per square inch, above which the metal suddenly extended about two per cent; it then dropped a little in tensile resistance and recovered, as in the case of mild steel, further extension being very slight up to 30.6 tons. After this the extension was uniform up to the point of rupture at 34.76 per square inch.

FINE WIRE DRAWING.—A correspondent of the *English Mechanic* writes as follows in a recent issue: "The Asiatic wire drawers have very long ago used castor oil in preference to any other kind. Their dexterity is surprising, the wire for the Trichinopoly chains of gold and silver being like hair, and every good workman draws his own. A man made me a plate for the fine ganges from a flat rasp of English steel, which I still possess. He drew copper, zinc and brass equally well. Castor oil, being one of the cheapest in India, is used to soften harsh leather shoes and ropes. The fresh leaves of the castor oil tree, too, are gathered, bruised and rubbed in the hand, then stuffed tightly into stiff European boots, male or female, and so remain all night; the leather then becomes quite supple. For feeding large drills, I like this oil mixed with soft soap."

PROPELLER BLADES.—From experiments made last year in the Danish navy it appears that there is but little difference in the efficiency of the two-bladed and four-bladed propellers, the same blades being used in each case, so that the loss of one-half of the propeller surface was balanced by the lessened friction. At speeds greater than twelve knots, however, the vibrations with the two-bladed propeller was excessive.

SCIENTIFIC PROGRESS.

THE ACTION OF WATER UPON LEAD PIPES.

Dr. W. R. Thomas, in a recent lecture upon poisoning from drinking water gave the rationale of the action of water upon lead in pipes as follows: "Water generally contains a certain amount of carbonic acid. This acid acts upon the inner surface of the pipe, forming an insoluble internal coat of oxy-carbonate of lead, which effectually prevents the water from further acting upon the pipe. Hence old pipes which have been down for years are far less dangerous than new ones. Water which contains lime salts, as the carbonates and sulphates, also assist in forming an internal insoluble coat, as the carbonates and sulphates unite with the lead. New pipes are apt to be acted upon by the oxygen which the water contains. A soluble oxide is formed, which contaminates the water. The nitrites, nitrates and chlorides found in water contaminated by sewage are very injurious, as they dissolve the lead; so also peat and other vegetable matter have a similar deleterious effect. The Sheffield water from a certain source is acid, and most certainly dissolves the lead. The water in other towns has had a similar effect upon the lead. For some time the inhabitants of Keighley suffered from plumbism, as we do now, from drinking-water. Mr. Jarman of Huddersfield, recommended the authorities of Keighley to use limestone to counteract the acidity of the water. This was placed in conduits and the water was allowed to pass over it. They found at Keighley that it has been necessary occasionally to add quicklime to aid the limestone, especially in summer when the water is scarce. This plan, which has been adopted at Keighley, and found to succeed, is now being tried in Sheffield, and I trust it will be equally successful here. It is a matter of vast importance to the town of Sheffield, as the drinking water containing lead is now giving rise to a great amount of disease and suffering."

MAN IN HIS RELATION TO COAL.—The last of a course of six lectures upon scientific subjects, which have been delivered last winter at the Brooklyn Institute, was given on March 1st, by Professor J. S. Newberry, before a large and appreciative audience. His subject was "Man in His Relation to Coal." The lecturer gave an extended history of the discovery and use of coal, and its effects upon civilization. "The growth," he said, "of industrial business is the distinctive feature of modern life, and the cause that has maintained and sustained the mechanical sciences is coal. Should our supply of coal cease, all the wheels of industry would be stopped and we would soon go back to the dark ages. The force given out by a ton of coal is equal to the force exerted by six men and a boy throughout a year. Coal was an element entirely wanting among the ancients. The English coal mines have been the secret of British wealth and commercial supremacy. English statesmen acknowledged this, and in speaking of the power of their country invariably connect it with her coal production. The coal and iron industries of a country are inseparable, and it is fortunate for us in America that there is, to all appearances, an inexhaustible supply here of both of these precious minerals."

DUST PARTICLES IN THE AIR.—Mr. John Aitken, a well-known investigator of the atmosphere, has recently made a series of experiments on the number of dust particles in ordinary air. So far his results show that outside air, after a wet night, contained 521,000 dust particles per cubic inch; outside air in fair weather contained 2,119,000 particles in the same space, showing that rain is a great purifier of the atmosphere. The air of a room was found to contain 30,318,000 particles in the same space; that near the ceiling containing 88,346,000 per cubic inch. The air collected over a Bunsen flame contained no less than 499,000,000 particles per cubic inch. The numbers for a room were got with gas burning in the room, and at a height of four feet from the floor. These figures, though not absolute, show how important is the influence of a gas-jet on the air we breathe, and the necessity for good ventilation in apartments. Mr. Aitken remarks that there seem to be as many dust particles in a cubic inch of air in a room at night when gas is burning as there are inhabitants in Great Britain, and that in three cubic inches of the gases from a Bunsen flame there are as many particles as there are people in the world.

UTILIZING SUN HEAT.—One of the most interesting and practical methods of utilizing the heat of the sun is that recently invented in Salem, Mass. The arrangement consists of a shadow box, the bottom of which is of corrugated iron, and the top of glass. This is placed outside the building in such a position that the sun shines directly upon it; the heat rays of the sun pass through the glass and are absorbed by the iron, heating it to a high temperature, and by a system of ventilation a current of air is passed through the apparatus and into the room to be heated. By this means the air has been heated on sunny days to about 90° Fahr. by passing over the iron.

ELECTRICAL PROGRESS IN 1887.—The *Electrical Review*, in a recent review of the progress of electrical science during 1887, says: "Little was added to our knowledge of electricity dur-

ing 1887, but there was a remarkable development of its practical applications. One of the most important scientific discoveries was that sparks in tubes dissociated iodine, bromine and chlorine. Immense improvements have been made in the construction of dynamos, motors, accumulators and secondary generators, and in consequence the electric lighting and working of railroads and tramways has entered upon a commercial and useful stage. The application of powerful electric currents to smelting, as in the Cowles process for producing aluminum, and to welding, as proposed by Elihu Thomson, is gaining rapid progress, while the use of enormous dynamos for the deposition of pure copper from impure ores is gaining ground with giant strides.

CONVERSION OF HEAT INTO ELECTRICITY.—Messrs. Hurlhausen and Nerst have recently performed an experiment which is very curious from a scientific point of view. On placing a thin sheet of metal in a magnetic field and keeping its two extremities at unequal temperatures, they remarked that the extremities exhibited a very feeble, yet appreciable difference of potential. Moreover, the direction of the current varied according to the direction of the lines of force of the magnetic field. The experimenters operated with a plate of bismuth, 5 centimeters square and 2 millimeters in thickness placed in a field of 5,000 units. The difference in temperature was obtained by placing against the ends of the plate two sheets of mica, one of which was dipped into cold water and the other was heated by the flame of a gas burner. Under such circumstances, a difference of potential of 0.00125 volt was obtained.

A REMARKABLE TELEPHONE.—The Hartford *Courant* remarks: The adjutant-general's office at the capitol has been connected with the room of the quartermaster-general on the third floor by means of a Hall short-distance telephone line. The wire employed is composed of six strands of steel, wound around a cord covered with a preparation of paraffine, which prevents induction. No battery is required, and the voice of a person standing in the room at a distance of twenty feet from the instrument can be distinctly heard at the other end of the line. By means of this remarkable invention the adjutant-general and his associates can carry on a conversation with those connected with the other departments without leaving their desks. The new telephones have been used with great success in other cities. The limit is five miles, but the inventor hopes to exceed this in the near future.

WHERE PHOSPHOROUS AND MANGANESE ARE IN BASIC PIG-IRON.—According to Herr C. Reinhardt, the proportion of phosphorous and manganese in basic pig-iron is almost invariably greater at the edges of a section than it is in the center. In the case of slowly cooled gray cast iron the quantities of phosphorous and manganese vary throughout the mass, but appear to do so together. In a mass of the metal, phosphorous is very unevenly distributed in the various layers, and its amount appears to be greatest at the surface. The same may be said of manganese, and with a rapidly cooled sample both metals are found in the largest proportion, not only in the surface layer, but upon the whole exterior surface of the pig-iron.

EDISON AND FLYING MACHINES.—Mr. Edison is now working on an electrical flying machine which the Spanish Government has commissioned him to construct for the purpose of observation in time of war. The lifting and propelling machinery will consist of revolving fans to which power will be supplied through a wire connecting with an electric dynamo on the earth. No doubt aerial navigation to the length of a wire is practicable, but inventive genius will hardly be content to rest thus circumscribed. Man certainly will yet be able to soar through the air as freely as the feathered portion of creation.

THE CURVES OF FISH.—A paper was read at the recent meeting of the American Society of Mechanical Engineers by Mr. Parsons, on the subject of the "Area Curves of Fish," which developed some interesting data, which may prove serviceable to ship builders. It was claimed as an invariable law in the natural formation of fish, that the cross section of greatest area in the fish was always found to be at exactly the same relative distance from the tip of the snout, thus indicating a constructive law of great importance.

THE EARTH CRUST UNDER THE SEA.—The attention of the French Academy of Sciences has been drawn by M. Faye, the eminent astronomer, to the apparent geological law that the cooling of the terrestrial crust goes on more rapidly under the sea than with a land surface. From this he argues that the crust must thicken under oceans at a more rapid rate, so as to give rise to a swelling up and distortion of the thinner portions of the crust; in other words, to the formation of mountain chains.

When vessels or timbers sink to great depths in the ocean, the pressure is so great that the water is by this means forced into the pores, and the wood becomes too heavy to rise again. It is the fact of this same pressure that makes it impossible for divers to descend to any great depth.

GOOD HEALTH.

State Board of Health.

The report of the State Board of Health for May furnishes returns from 90 cities and towns, which give a mortality of 1035 in an aggregate population of 723,950. This average of death-rate indicates a very favorable condition of public health throughout the State, being a percentage of only 16.8 per annum. When this is contrasted with the aggregate mortality of the Eastern States, the great salubrity of California becomes notably favorable.

In the list of fatalities consumption leads, numbering 174. Of course a large proportion of these cases owe their origin to an Eastern climate, the parties having come to California to improve their condition.

Pneumonia comes next, numbering 72, a decrease from the last report, but giving more than a general average for the month of May.

Diphtheria claims 36 deaths, 15 of which occurred in San Francisco, but not more than its proper average according to population.

Bronchitis was fatal in 25 cases; congestion of the lungs, 14; orp, 12; scarlet fever, 9; typhoid fever, 28—a slight increase over last month's report. The dreaded and deadly

Cancer

Is charged with 30 cases, 23 of which are placed to the credit of this city. The very large excess of cancer cases in this city over other portions of the State is due to the fact that nearly all persons who are attacked with this malady, and who can afford the means, come to San Francisco for relief, but generally too late to be of any avail.

Cancer Can be Cured.

We are in the frequent receipt of letters and inquiries asking if the party in this city, to which we have made such frequent reference, still continues in successful practice, and whether we still have as much confidence in her skill as ever. We invariably answer in the affirmative, for cases of successful cures are constantly coming under our notice—some of which are fully as remarkable as any which we have heretofore noticed.

A few weeks since we met a lady from Victoria who was then under treatment for cancer on the tongue. The case had been pronounced one of unmistakable character by the leading physicians of Victoria, who could give the patient no assurance of relief. By the advice of friends who knew Mrs. Dr. Cook she came at once to this city, and in due time returned home a well woman, without submitting to either the knife or plaster. Constitutional treatment with some simple healing salves were the only remedies employed. It stands to reason that a cancer thus cured is cured for all time, while the application of the knife or plaster, without constitutional treatment, simply aggravates the trouble in 19 cases out of 20.

There is a gentleman from Victoria now under treatment for cancer under the tongue, sent here by this same lady. His malady has made great progress, and but little encouragement was first given of any possible help; but the symptoms have since become highly favorable, and there is now a strong probability of a successful issue.

There is another case to which we would briefly allude of a very elderly lady in New Bedford, Mass., in a family in whose welfare we have long felt a deep interest by reason of old acquaintance. Contrary to her usual custom, Dr. Cook allowed herself to be persuaded to do what she seldom does—send remedies with written instructions for use without personal interview. The case was one of long standing—the patient, in the opinion of her physician, being too old and feeble to endure a surgical operation. The remedies were sent, and her physician had the manliness to watch the case, and when he saw it was fully cured, had the independence to say so and write to that effect in a letter of congratulation which he addressed to Mrs. Dr. Cook. There was no hesitation in pronouncing it a case of unmistakable cancer.

If the physicians of this city would drop their cruel and antiquated system of medical ethics and adopt the course pursued by the New Bedford physician, the monthly reports of death from cancer here would dwindle to the very lowest scale of mortality of any in the long list of human maladies. But how can we expect such a result so long as respect for medical ethics is held more sacred than that for human life?

If the faculty would let patients exercise their own discretion in choosing a physician in this special malady it would soon almost disappear from this city, and in this connection we would repeat the statement which we have before made, that no person has ever applied to Mrs. Cook in the early stage of the disease who has not been permanently cured. We have had several such cases of failure reported to us; but in every one we have found them to be without foundation. We will publish any such case of failure that is proven to be genuine. It is true she has lost many cases, but not one which has not been treated for a greater or less length of time by other physicians, while she has cured great numbers who have been given over to die by others. We have given these three cases as a sample of the many recent ones to which we have not yet made any reference. We dwell at this length upon this subject because of our interest in humanity, and we know we have the secret sympathy

of many physicians, who dare not speak out their honest convictions because they know if they do so they go counter to the ethics of the profession, and will be made to suffer for it. What we have done is without pay or hope of reward. If this press would take up the matter much good would be done. One of our leading dailies recently sent a reporter to interview us. He was introduced to the doctor and a number of her patients, was thoroughly satisfied that we were correct in this discussion, and wrote out a column fully endorsing the same. The article was submitted to the managing editor of the daily, who refused to insert it without the payment of one hundred dollars. He was refused even one hundred cents, consequently this article never saw the light. Many lives might have been saved by such an endorsement. But no, the slimgy dollar was more to that journal than human life.

PREVENTION OF SCARLET FEVER.—Sulphur is recommended as a preventive of scarlet fever. I think it might be useful, but the standard specific for that purpose is belladonna in some form, allopathic or homeopathic. The latter form is easier to manage with children, as it can be given in sugar pills. Belladonna fulfills three purposes. It is a preventive. In a case where the attack of fever is inevitable and cannot be prevented, it is then a preparative and palliative, mitigating the severity and danger of the attack when it comes. It is also a specific remedy for the disease. As soon as it is suspected that a child has been exposed to scarlet fever, four or six belladonna sugar pills, such as are used for homeopathic medicines, should be given morning and evening until the time is passed when the disease should have appeared. If one prefers allopathic treatment, let him not fail to obtain directions from a physician as to the dose to be given. The remedy should not be used carelessly and unadvisedly, but it is the specific for scarlet fever, whether the object sought is prevention, mitigation, cure or avoidance of unfortunate after effects, such as affections of the ear or eye.—J. P. Robinson.

CREMATORIES.—It cannot be denied that cremation is a growing practice. Crematories are beginning to pay expenses in this country, and at the crematories of Europe there were 14,000 incinerations last year. There are 22 crematories in Europe, of which 10 have been built within the past year. There have been 600 incinerations in Germany and 800 in Italy. There are seven crematories in the United States, and six in progress of construction. One will soon be constructed for this city.

USEFUL INFORMATION.

A VALUABLE PLANT.—The espinosilla, or thorn plant, says Marchal Oropesa, a well-known Mexican naturalist, is native to Mexico, and abounds in various parts of the republic, principally near this capital, at San Angel, Texcoco, Santa Fe, etc. It is one of those beautiful wild plants which adorn the plains of Mexico, and it is found particularly in cold, dry spots. It has been thus christened because on touching it a sensation is felt similar to that which a plant covered with thorns would produce. The Aztecs lacking soap—so necessary to their health and happiness—found its substitute in the espinosilla. They agitated a bunch in water and it produced a lather, with which they washed, using the plant as a scrub-brush. Even to-day it is used by women as a hair preservative, having extraordinary powers in that direction. But its most useful application is as a medicinal agent to fight fevers, as it is an excellent diaphoretic. Its ancient name is beautiful. Holtz-it-il-xochitl, a compound word. Holtz-it-il—humming-bird, and xochitl flower; thus translated being flower of the humming bird. It is a perennial plant of variable height, but never more than three feet in height; of a pivotal root, rather flexible, of white surface, corrugated, from which spring secondary roots, thin and separated. In general, the plant is rough and thorny, more so as its age increases. The taste is bitter, especially of the leaves, but the root has two tastes; when first tasted being sweet, after which it is bitter.

LIFE-SAVING ROPES.—The legislature of New York passed a law in 1887 requiring every hotel keeper in the state to keep a life saving rope in every room in his hotel; but thus far the law has been practically a dead letter. Of 246 hotels recently examined in the city of New York, 228 were found not to have complied with the law. The authorities have now determined to test the validity of the law, and as a test is to be made in the case of a prominent hotel keeper, it promises to be one of peculiar interest. The efficiency of the rope as a means of saving life in case of a fire in a big hotel has not been determined; but it seems plain that a rope is a good deal better than nothing. The expense of providing the ropes and the proper fastenings is said to be large; still, it can be only a mere bagatelle compared with the possibility of saving even one life in an emergency.

A NEW SOURCE OF TROUBLE FROM OIL PIPE LINES.—There was considerable excitement in Sussex County, N. J., a few weeks since over the bursting of the pipe line of the Standard Union Oil Company. The oil has spread over

acres of rich farm land in Vernon township, and great damage has been done to growing crops. The soil is saturated and rendered useless by reason of being poisoned by crude oil, some lands being, it is reported, completely ruined, at least temporarily. A great quantity of the oil has flowed into the streams, and fish are dying by hundreds. The fish commissioners are doing all in their power to avert the disaster that threatens the fishing interests. The Neakill river bridge narrowly escaped being destroyed by fire, owing to some malicious person setting fire to the oil one night. The Standard Oil Company, it is said, will be sued by the farmers for the damages sustained by the oil flood.

AN ELEVATOR CUSHION.—Many devices have been tried to prevent serious consequences from the breaking of elevator ropes; but nothing has yet appeared to be in any special degree satisfactory. A properly constructed air cushion would seem to be the thing to be desired. Such a device was projected a few years since in Boston, we believe; but as a serious accident occurred the first time it was tested, the thing was abandoned. It was evidently faulty in construction, for it is not possible for such a device to fail if properly constructed. It would seem from the following, which we clip from an exchange, that success in this direction has been finally accomplished: A successful test of the Ellithorpe air cushion for elevators was made recently in a New York dry-goods house. One of the largest Otis elevators, weighing 2300 pounds, equipped with plate glass mirrors and fragile electric light globes, and loaded with baskets of eggs and with glassware filled with water, was cut loose from the top floor and allowed to fall to the bottom of the shaft. It shot down eighty feet in about two seconds. The "cushion," which stands seventeen and one-half feet high from the bottom of the shaft, and is constructed of wood and glass so as to be air-tight, received the elevator with so little shock that not even an egg was broken nor a drop of water spilled. The test was considered a complete success. The force of the compressed air of the "cushion" gently pushed the elevator up again about four inches, when it descended again to its place without jar. The force of the descent was estimated at the top of the "cushion" as indicating 60,000 pounds.

METALLIC CEMENT FOR STONE.—The restoration of some of the most important stone structures in Paris, such as the colonnade of the Louvre, of the Pont Neuf, and of the Conservatoire des Arts et Metiers, has been mainly accomplished by means of a metallic cement invented by Prof. Brune. It consists of a powder and liquid, the first composed of two parts by weight of oxide of zinc, two of crushed limestone, and one of crushed grit, the whole intimately mixed and ground, other in suitable proportions being added as a coloring matter; the liquid employed consists of a saturated solution of zinc in commercial hydrochloric acid, to which is added, a part by weight, of hydrochlorate of ammonia, equal to one-sixth that of the dissolved zinc, and this liquid is diluted with two-thirds of its bulk of water. One pound of powder is mixed with 2½ pints of liquid.

DON'T USE SHOT FOR WASHING BOTTLES.—Small white globules of porcelain are made in Munich. They are made to take the place of ordinary lead shot used for cleaning wine and medicine bottles, as porcelain is entirely free from the objection of producing lead contamination, which is often the result when ordinary shot is used. Their hardness and rough surface producing, when shaken, greater friction, adapt the porcelain shot well for quickly cleaning dirty and greasy bottles, and as they are not acted upon by acids or alkalis, almost any liquid can be used. If nothing better is at hand, use tacks; but don't use shot.

TO MAKE A GOOD POLISH.—Take one ounce oil vitriol, one half gill sweet oil, one gill powdered rotten stone, 1½ pints rain water; mix and shake well before using; add to the mixture one half ounce nitro-myrrane to make it smell good, stick on a French or German label that nobody can read, boom it in the papers as a newly discovered polish just imported, and you can do a good business. At any rate you'll have a No. 1 polish, and if your customers don't read the papers too closely, you may get rich selling it. Put on with cotton waste and polish with woolen or chamolite.

VARNISH FROM SUGAR.—The Scientific American advises the use of a varnish of sugar. This is made as follows: Dissolve equal parts of white and brown sugar in water to a thin syrup, add alcohol, and apply to hot glass plates. The film dries very readily, and furnishes a surface on which it is perfectly easy to write with pen or pencil. The best ink to use is India ink, with sugar added. The drawing can be made permanent by varnishing with a lac or mastic varnish.

TO MAKE A FLANGE JOINT that won't leak or burn out on steam pipes, mix two parts white lead to one part red lead to a stiff putty; spread on the flange evenly, and out a liner of gauze wire—like mosquito net wire—and lay on the putty, of course cutting out the proper holes; then bring the flanges "fairly," put in the bolts and turn the nuts on evenly. For a permanent joint this is a 1.

The Elko Mica Mine.

The Salt Lake Tribune says: "The wonders of this western country are just beginning to be opened up. The latest report of discoveries comes from Elko county, Nevada, where what is claimed to be the most valuable mica mine in the world has just been purchased by G. D. Schell of this city, for himself and John J. Buckout of St. Paul, Minn., at the moderate price of \$60,000. The mine, however, is not a new find; it has been located, and assessment work has been done for several years, but it has remained for Mr. Schell, an experienced miner, to catch on to the mine's true value, and now the property could not be bought for \$100,000. The mine is up in the Ruby mountains, 10,000 feet above the sea level, and it is 4000 feet up from Ruby Valley to the mine.

Mr. Schell went over there last week to examine it, and now he is in possession of mica deposits superior even to those of North Carolina. Mica is found in Wyoming, New Mexico and Hampden county, Massachusetts; but the upheavals seem to have shattered the plates, and contact with iron had discolored them, so that the demand for good stock has far exceeded the supply. The Ruby range vein is 12 feet thick and crops out here and there on the surface for 1000 feet. Shafts have been sunk which show that the further down you go the faster the mica improves. At a depth of 50 feet plates two feet square prevail just as clear when held up in the light as the average window glass. The plates are firm, and free from the crackle characteristic of surface mica, so that at a depth of 75 or 100 feet stock might be found as free from defect as crown plate. Work has begun under Mr. Schell's superintendency. One ton daily will be extracted from the mine and shipping in 100-pound boxes will begin as soon as possible. The two feet square plates of mica are not of a commercial size, as the largest used in store windows are 4x6 inches; so they are cut up into assorted sizes to fill orders. The 2½x2½ inch plates are worth 70 cents per pound, wholesale; the 4x4 inch size, \$9 per pound, and the 4x6's \$12; so that prices per ton range from \$1400 to \$24,000! Mr. Schell will put a full line of his mica mine stock in the Deseret Agricultural Fair, and hopes similar veins may be found in Utah. He has brought back to the Continental hotel a full line of samples from the mine, and is showing them to his friends with justified pride."

A Lucky Miner.

The lease under which Dart, Oliver and Johnson worked the Bonanza mine the past two years expires in a few days. When they cleaned up the last pocket a few days ago, without assuming more expense for the short time left for the lease, they notified J. G. Divoll that the mine was at his disposal. Mr. Divoll came to Sonora, Wednesday, and proposes to work it himself, having unbounded faith in its great richness. Wonderful luck, if it is luck, has attended Divoll in all his mining operations. Coming here in 1862, he was engaged at different times in various pursuits, which he often left to try his fortune in mining, which always proved profitable to him. Working pockets in different mines on Saratoga Hill, at short periods he made strikes that always kept him supplied with money. A few years ago he acquired an interest in the Bonanza mine. It was worked several months without result. Not until Divoll's direction was followed did the mine yield, and then it gave up several hundred thousand dollars, making each owner rich. After the big yield the entire mine came into Divoll's possession, and a few days after he pointed out where more gold was situated, and \$60,000 more were added to his pile. Thinking he had a bank to draw upon at will, with plenty of money for his uses, he left the property idle for a time. Two years ago he leased it to Dart and Oliver. They worked for a while, but not until Divoll pointed out where the pockets would be found did they meet success. During the terms of the lease nearly, if not quite, \$150,000 was taken out. Now that Divoll himself intends working the mine, there will be no surprise here to learn that another fabulous amount has been added to the circulating medium of the country. Every time he gets to mining it seems that what he touches turns to gold, and those who were connected with him have enjoyed the benefit of his luck. Whether he be a good miner or not he has thus far been successful, and that is the best test to be had. He seems to have an intuitive knowledge of the way lodes and leads run, and can tell by a fissure or seam what will be found by following it. He is confident that larger sums remain than has yet been extracted. With his knowledge and luck there will be no surprise at any amount of gold he may yet take out of the Bonanza.—Tuolumne Democrat.

MARY J. SHIELDS, Martha J. Trebilcock and John H. Paul have brought suit in the Supreme Court against the Empire Mining Co. of Grass Valley for damages aggregating \$87,000. At the explosion at the Empire mine a few months since Paul was badly injured, Mr. Shields' husband was killed and Mrs. Trebilcock's son lost his life. The complainants allege criminal carelessness.

The Chollar mine yielded \$24,551 last month; average value of ore, \$21.73.

SCIENTIFIC PRESS PATENT AGENCY.

DEWEY & CO., PATENT SOLICITORS.

A. T. DEWEY. W. B. EWER. G. H. STRONG.

SAN FRANCISCO

Saturday Morning, June 7, 1888.

TABLE OF CONTENTS.

EDITORIALS.—Growth of the Mining Industry; Portable Smelting Furnace; Number of Paying Quartz Mines; The Key Monument; 1. Passing Events; Low Price of Silver and Its Effects; Two Shafts; Mining in Bolivia; B. Going for the Secondary Deposits; Chute Landing; The Cipher in the Shakespeare Plays; Badness Depressions; 9. Russia in Asia; British Investment in America; Improvements in Warfare; 10.

ILLUSTRATIONS.—Portable Smelting Furnace with Williams' Improvement; 1. Vessels at a Chute Landing on the California Coast; 9.

CORRESPONDENCE.—Kernville Notes; Los Burros Mines; 2.

MISCELLANEOUS.—The Astronomer's Dream; Laziness and Luck; 2. The Close Fists Company; Cost of Mining; The Prospector; A Historic California Town; 3. The E'ko Mica Mine; A Lucky Miner; 7. Industrial Notes; 13.

MECHANICAL PROGRESS.—Progress of American Iron Industries; Manganese Steel vs. Iron; Drawing Canal Boats with a Locomotive; Russia; Iron; Superheating Steam; Bull's Metal; Fine Wire Drawing; Propeller Blades; 3.

SCIENTIFIC PROGRESS.—The Action of Water Upon Lead Pipes; Man in His Relation to Coal; Dust Particles in the Air; Utilizing Sun Heat; Electrical Progress in 1887; Conversion of Heat into Electricity; A Remarkable Telephone; Where Phosphorus and Manganese are in Basic Pig Iron; Edison and Flying Machines; The Curves of Fish; The Earth Crust under the Sea; 6.

GOOD HEALTH.—State Board of Health; Prevention of Scarlet Fever; Crematories; 7.

USEFUL INFORMATION.—A Valuable Plant; Life-Saving Ropes; A New Source of Trouble from Oil Pipe Lines; An Elevator Cusping; Metallic Cement for Stone; Don't Use Shot for Washing Bottles; To Make a Good Polish; Varnish from Sugar; 7.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming; 4-5.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments; 12.

SHOP NOTES.—Forty Years Ago; Orderly Shops and Good Tools; Do Tools Grow Tired; Pulley and Belt; 11.

STEAM BOILER NOTES.—Often Your Hard Water; Exhausting Back into the Boiler; Copper vs. Iron or Steel Pipes; The Test Pressures of Marine Steel Boilers; Steam vs. Water Power; The Corliss vs. Slide Valves; To Prevent Foaming; To Avoid Tearing the Manhole Gasket; Repairing Steam Pipe Breaks; Castor Oil in Boilers; 11.

COTTON AND WOOL.—Evolution of Cotton Seed; Reclamation of Waste Products in Wool Scouring; Cotton Cultivation in Russia; Our American Angoras; The Quality of Cotton; Cotton Mill Building; Sheep Shearing; Evolution; 12.

FLOUR MILL NOTES.—A Flour Mill Run by Electricity; British and American Wheat Growing; Flour Millers' Convention; 12.

Passing Events.

The observance of the National holiday has, as usual, caused a cessation of business during the week. In addition to the usual festivities of the day in this city, the monument to Francis Scott Key, author of the "Star Spangled Banner," was unveiled in Golden Gate Park.

The Idaho gold mine, Grass Valley, Nevada county, this State, paid its 225th consecutive dividend this week. The ore now coming out of this famous mine is about as rich as any they have had. Few mines can show such a record as this.

The strikes among the iron-workers in prominent Eastern foundries have assumed large proportions. Most mill-men believe the suspension will not continue longer than two or three weeks. A shut-down is always necessary at this time of the year for repair and stock-taking. The manufacturers, they claim, have used the same arrangements for years, and always opposed the Amalgamated Association as vigorously as at present. Since the strike of

1882 the scale has been signed in conference with but one exception, and that was in 1885, when a strike was declared. One by one the firms signed the scale that year, and the strike was over and the mills were all in operation within a month. On the other hand, the manufacturers assert that their mills are in good repair and that they could run all summer, but they will not pay more than \$5 per ton for puddling.

Low Price of Silver and Its Effects.

Silver has not long since been selling at 87 cents per ounce, the lowest figure touched during the century. Recently the price has somewhat improved, but even the present condition of the market is having a very depressing effect on the production of that metal, and unless an early advance in the price occurs, both the and many other industries are bound to suffer severely. That such advance will take place there is good reason to believe.

Now that one of the leading political parties of the country has declared in favor of both gold and silver as money and against the efforts being made to demonetize the latter, the chances of procuring legislation more friendly to the white metal seem somewhat improved.

It is pretty well understood that Senator Stewart has not abandoned his plan for having silver bullion deposited in the mint and certificates issued therefore to circulate as money. The Senator yielded his preference for his own and supported the Beck bill on the ground that the latter seemed at the time to have the better chance of becoming a law. Since its failure the Senator from Nevada has evinced a purpose to reintroduce and urge the passage of his original bill, slightly altered perhaps in some of its features. Should he do so, there is a strong probability that his effort will be crowned with success, as his own party might be expected to lend it their support.

That this measure or even the unrestricted coinage of silver should meet with so much opposition in this silver-producing country is something strange, seeing none of the evils predicted as likely to attend the increased coinage of this metal have here been experienced, nor has any inconvenience attended a like policy in other countries where its coinage, compared with its currency value, contains much less metal than our silver dollar. Among the nations of Europe the coinage rate varies from 14.9 to 15.5, the average being 15 ounces of silver to one of gold, whereas our standard silver dollar is 16 to 1.

Why such a persistent warfare should be kept up on this coin or on a more general use of silver in a country where this metal forms a staple is something inexplicable. The impression that obtains in certain quarters that silver is being produced at a dangerously rapid rate, or that it is so accumulating in the U. S. treasury that it is with difficulty the Government can get rid of it in payment of its creditors, is wholly without warrant. The world's annual product of this metal amounts at present to only about \$108,000,000. Of this the United States produce \$53,000,000, Mexico \$26,000,000, South America \$15,000,000, and all other countries \$14,000,000. When it is considered how much of this total is absorbed in the arts and otherwise disposed of, the coinage of the remainder instead of causing a glut can hardly meet the growing wants of this actively commercial age. As regards the accumulation of silver in the National treasury, there is reported to have occurred there during the year ending October 31st a decrease of more than \$20,000,000, and that the department has for the past few months paid out more silver than has meantime been coined. For some time past, in fact, it is gold that has been increasing in the treasury while the amount of silver has declined.

It is time this warfare on the white metal should cease, as its cheapness is beginning to tell with fatal effect on that branch of mining. Only under especially favorable conditions can it be made to pay any longer. Some companies engaged in this business have in consequence suspended operations and others are threatening to do so. Unless the market for this metal meets with early improvement, wide-spread disaster is to be apprehended. Nor is it the miners alone who suffer from this cause; all the debtor and producing classes are more or less affected by it. What makes the situation the more intolerable is the fact that it is largely due to extrinsic and

gratuitous causes. But for the efforts made to disparage silver in the interest of the creditor classes it would have been worth 20 per cent more than it is to-day.

There has been no over-production of this metal. On the contrary, it has not kept pace with the industrial and commercial expansion of the times, nor has it been relatively very much greater than that of gold. During the past 10 or 12 years the coinage of the various mints of the world has been larger than the product of silver made meantime, disclosing the general popularity of this metal and the impolicy of seeking to restrict its free coinage in this country.

Two Shafts.

As soon as a mine has commenced to attain any advanced depth, and give employment to a number of miners, facilities should be provided by which the men underground could escape in case of fire in the main shaft. The recent fire in the mine near Ophir, Placer county, offers a case in point. There, when the works at the shaft got on fire, three men below were asphyxiated. There was no way for them to escape. The men above were powerless until the fire was out.

In some countries there are laws compelling the companies to have two shafts, but if we had such a law here it is not probable it could be enforced. In some instances it would work a hardship as entailing additional expense to poor owners, and owners of rich mines would not spend the money in that way unless it was necessary for the proper working of the mine. With the mere object of providing safety for the men alone, few such shafts would be sunk unless it was compulsory.

There are many mines where the men literally take their lives in their hands when they leave the surface. A fire at the hoisting works would be fatal to them below. If men would refuse to work in such places a remedy would be found. The difficulty is to get concert of action among miners generally. At all events it would be possible to have some arrangement for furnishing air below, which could not be destroyed or put out of order in case of a fire at the mouth of the shaft. Mines having no more than one means of escape are never perfectly safe.

ACADEMY OF SCIENCES.—At the meeting of the Academy of Sciences on Monday evening the following donations to the museum were received: A collection of shells and echinoderms by Mrs. Van Gorden of San Simeon; fossil shells by C. W. Know of Parisima Creek; an obsidian arrow-head, found in Golden Gate Park by D. P. Secor, a visitor from Connecticut. The present to the Academy of a full set of Trouvelot astronomical drawings, valued at \$100, by a member of the Academy, who did not wish to be known, was announced by the librarian, who also reported the receipt of 48 books from correspondents and 13 books by donation. Dr. H. H. Behr read an interesting paper on the sudden appearances and disappearance of the *Vanessa Californica*, a beautiful butterfly that appears in myriads at times in California, and then is not seen again for perhaps 15 years.

LEACHING.—We shall commence next week the publication of a series of articles describing the Russell process of treating ores. The articles will be illustrated and will be of interest to the mining community, as all details will be given.

St. Louis realizes about \$400,000 a month from the investments of citizens in gold and silver mines. The St. Louis people are investing largely in mining property.

THE U. S. Treasury now contains the sum of \$629,854,087. Of the public debt, \$14,429,503 was paid off in June. The total public debt is now \$1,717,784,791.

THERE is a hitch in the building of the Cuyamaca railroad, and the projectors are stopping to raise \$70,000 before they proceed.

THE reduction of duty on pig iron proposed by the Mills bill is from the present rate of \$6.72 to \$6 per ton.

THE stage from Hildreth to Maderia was robbed on Monday and hullion valued at \$10,000 was stolen.

Mining in Bolivia.

[Written for the Press by Santiago Black, of Oruro, Bolivia.]

Having taken much pleasure in the perusal of your valuable and justly popular paper, and thinking that some of your readers might take an interest in mining matters from a region of which I believe that there is as little known as of any civilized country existing, I therefore send you the following remarks on the mining advantages and disadvantages of Bolivia.

Of the mineral wealth of Bolivia, it may truthfully be said, the "half was never told." And of the antiquity of all methods now in use for treating that mineral, and of the almost complete ignorance of all the most modern methods of, and machinery for treating ore cheaply or economically, it may with equal truth be said that the half would never be believed, even if it were told.

A densely ignorant people, instructed by those who were scarcely more enlightened than themselves, they have ever been and still are in the condition of the blind being led by the blind. And the only reason they do not all fall into the ditch, may be found in the fact that they are already at the very bottom. And as the laws of gravitation are not conducive to falling up hill, they will probably remain in their present condition until the advancing wave of progress shall move them aside, or the light of a better education dispels the darkness in which they were born, and in which they have been contented to live.

Some of the mining advantages are as follows: First: That there are large quantities of discarded ore on the dumps of different mines, which, with proper appliances, would give a good profit for working. That there are not only mines, but groups of mines unworked, which, with proper machinery and a thorough knowledge of mining and milling, might be made to pay most handsomely. Free gold exists in certain localities, in more or less large quantities, but in all parts which I have visited, it requires a considerable outlay of capital to accomplish anything worth speaking of.

This is a country almost destitute of fuel, but water-power can be obtained in abundance, which does away with the absolute necessity of running the machinery by steam.

Special opportunities are offered in the working of tin. That metal, which is steadily increasing in value, and for which the world is constantly finding new uses, abounds in certain districts of this country.

An enterprise which could scarcely fail to pay well here would be an ore crusher, with good concentrators, either treating ore for so much per ton or buying the ore and treating on one's own account. When one considers that the tin mines, worked in a very unsystematic manner, and the ore washed in the most primitive way have formerly paid dividends, and also that the bulk of the ore is still untouched in those mines, it will be seen how well the above-mentioned enterprises would pay.

There is a dearth of practical men in Bolivia. Most of the foreigners who visit Bolivia, if not of a dissolute sort, are at least of a sort who have no peculiar choice of the manner in which they shuffle through this life so long as it costs them no great exertion, and who, after a life of debauchery, are apt to blame the country for the misfortunes they have brought upon themselves.

Bolivia was first mined for gold and silver by the Indians, who also put a price on the precious metals, though for what reason cannot at the present day be satisfactorily explained. And when the Indians were reduced by the Spaniards to almost abject slavery, they were not only compelled to labor for a mere pittance, but were forced to impart to the harsh lashmasters all the knowledge they had of the country. So that I believe there is not one square mile of Bolivian country accessible to the white man which was not thoroughly prospected long before the present generation came into existence. Consequently, to the poor prospector Bolivia offers few inducements; and to the working man (unless he be a good mechanic), it offers much less. But for the man having sufficient capital to work upon and bringing the necessary machinery there awaits a fortune both certain and large.

The Idaho mine at Grass Valley on Monday declared its 225th dividend. The ore now coming out is very rich.

Going for the Secondary Deposits.

In a late number of the PRESS something was said about that class of our auriferous gravel formations known as tailing deposits, two of which, the one resting in the bed of Slate creek and the other in Shirt Tail canyon, being there spoken of as constituting the most important of these secondary deposits. We have, since the publication of that article, been informed that active measures are in progress for opening the last named deposit, which it is calculated will be in operation within the next few months.

The quantity of stuff to be handled here is enormous, amounting to something like 10,000,000 cubic yards, all of which is more or less auriferous. How much gold it carries cannot well be determined, though the experts count, we believe, on \$1 per cubic yard, at least. In prospecting the bedrock as much as a dollar to the pan is sometimes obtained, the most of the gold here being coarse. That distributed through the great mass of the material is, however, rather fine, being such as in former washings escaped from the hydraulic sluices. With the improved gold-saving apparatus now in use, even the smallest particles of the precious metal contained in these tailings can be arrested and saved, nor will the cost of rehandling them be very large. This will, in fact, be the simplest and least expensive kind of mining extant, neither complicated machinery, science nor costly methods being required for carrying it out.

At the start an open cut of sufficient dimensions will have to be blasted through the rocky ledge that crosses the channel below the deposits and prevents their being carried out by the winter floods. This done, and the bottom of the cut paved with wooden blocks or bowlders, it will only remain to get the material into the outletting race, a service that is to be performed by a machine recently invented for moving this class of deposits, aided by the water that runs down the canyon.

The above will be the only preliminary work required to be done, as also the style of plant and the mode of procedure here called for. Simple and cheap enough considering the big results that may here reasonably be expected.

UTILIZING FURNACE SLAG.—In one of the addresses delivered at the meeting of the British Association, held at Aberdeen some two years ago, it was remarked that the iron smelters had not been particularly active in their efforts to discover methods of utilizing the blast furnace slag. There would be no room now for any complaint on that score. The attention of the iron and steel trades are largely concentrated on this point, and much progress has been made of late. The Skinningrove Iron Company, at Loftus, are putting down a crushing plant to reduce the slag for cement. In most of the attempts yet made to utilize cement, the outlets considered likely have been for cement, road-making and paving flag-stones. More attention is being given to this matter in England than in this country. It should not be so. The utilization of waste materials in every department of industry should claim the earnest attention of all persons engaged in industrial employments. We expect to see in the near future a much wider and more far-reaching development in this direction than has heretofore prevailed both in our own country and abroad.

KRUPP AND THE JAPANESE GOVERNMENT.—According to news from Berlin, Krupp has lately made an arrangement with the Japanese Government to establish a branch of his cannon-making business in Japan, and is to manufacture all the heavy artillery the Government may require.

Chute Landings.

The immense lumber trade of the California coast is carried on as far as shipping facilities are concerned under disadvantages which few realize. There are very few good harbors anywhere on the coast line, and from those places where the lumber is shipped, there may be said to be none at all. The result is that a system has been devised for placing the lumber on the vessels, which is different from that in vogue anywhere else in the world.

Wherever there are lumber mills in small settlements, a "chute landing" is built, and at these chutes all the freight by sea is handled. As there is as yet no railroad running anywhere near the coast in Sonoma, Mendocino and Humboldt counties, about all the lumber and freight traffic is done by schooners, and for them the chute landings are necessary.

As a general thing these chutes are built on the south side of the points, so as to be protected from the prevailing northwest winds of the summer months. Many of them are very expensive structures to build and maintain. At some places it is expected that the chutes will be carried away by the storms of winter, so that new ones are built each season. There are other places, however, where the chutes have

with chutes, since wharves cannot be maintained.

The Cipher in the Shakespeare Plays.

Through the courtesy of Mr. Moss, we have been allowed free access to the original folios of 1623 and 1632; these folios are in the well known library of Mr. Adolph Satro. The historical plays in the folios 1632 have every bracket and hyphen faithfully preserved. The pages of Henry V are slightly different—two pages are incorrect, 94 is 49, and 95 is 59. We have not space to give the remarkable results arrived at since writing our review of Mr. Donnelly's book. As, however, much favorable comment has been passed upon it, we give the following for the benefit of such of our readers as may feel interested.

The number 836 is obtained by multiplying 76 by 11; (the number of bracket words on column 1, p. 74). On subtracting 284, the number of words on column 1, page 74, from 836 we obtained 552. This number is greater than 523 by 29 (the modifier at end of column 2, page 74); one of Mr. Donnelly's root numbers derived from the primary root number is 523.

On taking 29 from 836, that is, on "modify-

Business Depressions.

More often than otherwise business depressions are merely the result of our imaginations; just as people often imagine themselves sick, when, in truth, they have no ailment at all. It is quite common to hear the expression—"Trade is dull," with perhaps the addition, "much more so than a year ago at this time." When any considerable number of people are impressed with such an idea, and are constantly giving voice to it, it will be so. Business will be dull because those who unconsciously work to that end make it so.

The disposition of the American people is to activity, to quick trading, to rapid progress in the developments of trade and industry. They would like a continuous boom. They are never satisfied with steady, legitimate trade. Money must be made rapidly; fortunes must be accumulated quickly. Some are thus in a hurry to the end that a period of rest and repose may be secured; but perhaps the majority continue the active pursuits of business for the mere love of excitement which it brings. The latter is more apt to be the case with the very wealthy—with the many millionaires. Our heavy millionaires do not continue in business merely for the love of money, or for what it

will bring them so much as for the pleasure and excitement of getting it.

But to return; if people instead of saying "trade is dull" should on all sides agree in the remark that business is good, as good or better than it was a year ago, so it will be. Of course there are some times causes for genuine depressions in business; but as a general thing, such depressions are greatly intensified by the unconscious acts of the masses who are constantly complaining and imagining conditions which do not exist, just as many make themselves sick through the imagination. There is probably no part of the world where these things are more observable and real than in California.

If a man is out of business and has a little spare cash, the question

is generally "What shall I do?" In this state he is quite too often down to the stock exchange, or allured by speculation of corner lot speculations. Don't do either. If you have a little money and don't see just how you can get into any better business, get yourself a small piece of land that you know you can handle, set out fruit trees, sow a small patch of alfalfa to feed a cow or horses or both, if you can make a profitable use of them. Plant a few vegetables for yourself and family. Raise a few chickens as broilers and for eggs. You can always sell the surplus over and above your own wants. In the meantime, while your fruit trees are growing, improve as best you can the ground between them. It will neither impoverish the trees nor prevent their growing. By such a course you will soon place yourself beyond want, and you will be able to add from time to time to your possessions, until you are quite independent. Of people who will do this the country will never have enough.

If all our people who are out of business would pursue this or some similar course of life and cease repining over the lack and dullness of work, we should have fewer "depressions of business," less poverty and want, and a universal and continuous reign of prosperity and happiness.

INDUSTRIES GROW Apace.—In 1878 twenty tons of basic steel were made in England. The yearly production now is nearly 5,000,000 tons. Other countries have within recent years, and contrary to former experience, increased their production of iron and steel in a far greater ratio than Great Britain, which was formerly the chief factor in the world's supply.

VESSELS AT A CHUTE LANDING ON THE CALIFORNIA COAST.

stood for years. At most of the landings there is only one chute, but in several instances there are two or three, where the trade warrants it. The illustration on this page shows the chutes at Coffey's Cove, in Mendocino county, and the little coast steamer Yaquina loading at one chute, and a lumber schooner at the other.

From the cut the general appearance of the chute is shown, and some idea of its construction is also given. The shears or legs are firmly secured to rocks, and the apparently frail structure is secured to them, held in position and braced by strong iron cables. The old cables of the cable railways are now utilized for chute building. The lumber is slid down the chute to the vessel, and by means of a brake at the extreme end its speed is checked before it goes to the deck. In lowering freight and baggage to steamers a sled is used, and horses draw this sled up with whatever is to come ashore from the steamer.

The outer end of the chute is so arranged that it may be raised or lowered to suit the tide or height of vessel. Many of these chutes are very long and quite expensive. Certain specified charges are made, these rates being fixed by law. The large mills of course have their own private chutes. The vessels are securely moored, so as to remain as nearly in one position as possible, but many are lost every year owing to the poor harbor facilities. Nearly all these chute landings are exposed in the winter months when the southwest or southeast gales blow. Nearly the entire lumber trade of the northern coast is carried on by vessels which load at these chute landings. Of course, at such places as Humboldt bay there are wharves, but the majority of the landing places are fitted

ing" 836 by 29, we obtained 807, and now by counting in the brackets and hyphens on column 1, page 74 in addition to the 284 words on the same column, we obtained 284 + 18 h & h; + 10 b; + 7 a; + 18 - bracket h = 302, 294, 291, 301. On taking these numbers from 807 we obtained 505, 513, 516, 506 (and 523).

These are Mr. Donnelly's root numbers, and the primary root number is, therefore, 836.

W. G. H.

LOST BONDS AND NOTES.—The lost bonds of this city amounting to several thousand dollars, about which so much has been said within a few days, calls to mind the fact that something like \$59,000,000 of the paper money issued by the United States has been lost or destroyed, by which the government is so much the gainer. During the last fiscal year the government coined \$33,266,831 silver dollars from \$24,563,615 worth of silver bullion. Here also is a large gain. It is well known that a large proportion of the profits of banks which issue paper money is derived from bills which are lost or destroyed, and, of course, never presented for redemption.

MINT COINAGE.—During the month of June \$1,882,000 was coined in the mint in this city, as follows: Gold—Double eagles, \$1,195,000; eagles, \$370,000. Silver—Standard dollars, \$239,000; quarter dollars, \$78,000. The total coinage at this mint for the fiscal year ending June 30th was \$25,701,284.80, divided as follows: Gold—Double eagles, \$12,555,000; eagles, \$7,260,000; half-eagles, \$2,995,000. Silver—Standard dollars, \$2,304,000; quarter dollars, \$192,000; dime, \$395,284.80.

Russia in Asia.

The Greatest Undertaking of the Century.

Very few people realize the large amount of work and engineering skill involved in the immense system of railroads which Russia is pushing forward into Northern and Central Asia, or the vast influence, political and commercial, which it is destined to exert on Eastern and Central Asia, the most densely populated section of the globe, and the source from which originally emanated the germ of almost every thing in religion, science, production and population, which the world now enjoys.

The completion and opening of the first or Samarqand section of the great trans Caspian road has just been announced. This section of the road is about 1000 miles in length and has been constructed in the short time of three years at the comparatively small cost of a little over \$31,000,000.

This is the pioneer of the great system of roads which Russia has laid out for Asia, work upon which has been commenced at several points. This system of railroads is the most stupendous one which has ever been entered upon in any quarter of the world, and greatly dwarfs our own transcontinental system.

The main feature of the system, which is already well under way, contemplates first a road from the northern part of the Caspian sea, following close along the southern border of Russia in Asia to some point near the mouth of the Amoor river, which empties into the Okhotsk sea, about midway of the gulf; or it may be continued southerly down to the southern extremity of the province of Amoor, to about the central portion of the west shore of the Sea of Japan. The entire distance will considerably exceed 5000 miles. Most likely there will be another road—an extreme northern branch—leaving the main road at some point before it reaches the province of Amoor, running north of the Okhotsk sea and reaching the Pacific Ocean at the most available point at or south of Behring's straits.

We have next the trans-Caspian system, which starts from the southeastern shore of the Caspian sea, and runs in an easterly direction just north of and parallel to the northern boundary of Persia. This road has already been completed through Merv to Samarkand, a distance of 1000 miles. It will be continued still further in a northeasterly direction to Tashkend.

At this point it will rest for the present, and be within easy distance—100 miles—of the western frontier of the Chinese Empire. From this point it will be carried still farther east and connected with the system of roads which must eventually be opened up in China.

Commercially speaking, this will be the most important of the entire system, as it follows very nearly an ancient highway of trade, and passes through several large cities which have been for ages the center of the great caravan trade of Central Asia. The country which it traverses is very level and highly productive—the most, probably, of any portion of the earth. Notwithstanding its commercial importance, it has been thus far constructed as a military road. Its object in that direction has been to consolidate and secure Russian control in Central Asia, and to prepare the way, when the proper time comes, for ready entrance into China or British India. It will eventually become the great central highway from Northern Europe to Peking.

Still another road has also been initiated by the Russian Government, exclusively within the bounds of Persia, starting from the southwest corner of the Caspian sea, and running eastwardly direct to Teheran, the most important city in the north of Persia. From that city the road will fork, one branch running eastward and northward to connect with the road already described at or near Merv. Another branch will leave Teheran and run south to some point on the Persian Gulf. This road is being constructed under the authority of the Persian Government, but by a Belgian syndicate, enjoying the warm support of the Russian Government. Material for the road is already arriving from Europe.

By a careful study of the map of Asia in connection with these lines, it will be observed that Russia is sending out two immense iron arms upon the north and south by which she will soon have Central Asia completely within a firm grasp.

It is only about two years since the world

was wildly excited over the prospect of a war between England and Russia on account of Russian military advances into the neighborhood of Herat, which city it was thought the Russians intended to make the base of active operations against British India.

It is now well known that the alarm was at least premature. Russia has made no further direct approach, but her generals have quite effectually flanked it, and the matter of possession is assured whenever circumstances may demand it. So far as actual evidence goes, the operations of Russia in Central Asia are purely commercial and absolutely peaceful. No one can say that she has any other object in view than the opening of markets in Western China, Central Asia and in Persia and Siberia. This is just what the English are doing on the south. The commercial possibilities in this direction are immense for Russia and for the world at large. Russia has complete command of the Caspian sea, with the magnificent navigable waters of the Volga penetrating for a thousand miles to the very center of that vast country. Her Siberian road will cross a large number of magnificent rivers, which are already alive with steamers which can bring the products of all Northern Siberia direct to the rail. Most of the country through which these roads pass are level and extremely fertile and more or less filled with minerals, especially iron and coal. The roads can be built with the cheapest labor on earth, and the right of way will cost but little or nothing.

Could the jealousies of the English and Russian Governments be adjusted, all these roads could be completed in a very short time and an immense commercial business built up which would greatly enrich the world and in no way injure British commerce. Such a thing, however, can hardly be looked for during the present century, although the work of road-building will go on continuously but with comparative slowness. Russia will use every possible effort to convert her Asiatic railroads into the actual development of Central Asiatic resources, but at the same time she will be always prepared to use them for military purposes whenever occasion may require. The possession of these roads, when completed, will be worth millions of men at arms and whole fleets of ships in any conflict which may be precipitated in Central Asia.

In the meantime England will exert her every muscle to paralyze the execution of the project and keep Russia confined within her hyphorean bounds. But the effort will be futile. The march of progress cannot and should not be arrested. Who can tell the inestimable blessings which would be conferred upon Central Asia if peace and good-fellowship could be set up between these two great powers, and Russia and England joined by a mutual connection of the trans-Caspian and Anglo-Indian lines of railroad and commerce?

THE STUDIOUS MECHANIC.—No mechanic ever excels or becomes prominent in his line of industry without much thought and study. It is not enough that he should get through his day's work and do it well; he must spend his leisure evenings and days when he has them, in improving his mind, in acquiring general information, as well as a knowledge of his own particular calling. A contemporary truly says: "The man who by thought and reading makes himself fit to be a foreman will some day find himself in a foreman's position; but the man who never reads and never thinks, who spends his out-of-shop hours in a groggery, will never be able to take a leading position. Edison or Westinghouse arousing in the beer shop would be Edison and Westinghouse unknown to the end of the chapter."

THERE are 140,000 miners engaged in the anthracite and bituminous coal mines in Pennsylvania. The Bureau of Labor report shows that the average daily wages is \$2, and there were 158 idle or lost days. In the bituminous regions the theoretical wages are \$16.20 a week, but when the lost days are subtracted, the average is only \$7.10. The average miner's wages, by the report of 1886, is \$6.67 a week.

MECHANICS TOOLS WANTED IN MEXICO.—Vice-Consul Charles Winslow, at Guerrero, Mexico, says carpenter's, blacksmith's and shoemaker's tools are in great demand, and sell rapidly and at good prices in that State. Tools of American manufacture have a decided preference.

British Investments in America.

The frequent announcements in English and American journals of British companies organized for carrying on the various industries in this country has become a topic of much thought and speculation. There are two classes of organizations of this character—the one merely furnishes the capital and transfers all the profits thereof to England; the other is a bonafide investment of both capital and profits in this country. The first is a leach upon our people, and should not be encouraged. True, it furnishes employment for labor and adds somewhat to our population, but the business is generally of that character which employs the largest amount of capital and the least amount of labor.

The most noted of this class of investments, and the one most pernicious to our interests, is that of cattle-raising. A firm in Scotland has furnished statistics which show that the British capital invested in cattle companies in this country exceeds \$20,000,000. The statistics referred to enumerate eleven companies who own in the aggregate nearly 700,000 head of cattle and occupy 3,319,000 acres of land. The first organized of these companies, which was started in Edinburgh, declared dividends for the first few years of about 20 per cent on its investment. This success quickly led to the organization of ten other companies, which are enumerated. The heavy profits that were realized at first led to such close competition that little or nothing has been made by these companies during the two years last passed. The London *Financial News* speaks of the present condition of these companies as follows:

The English investors in American ranch companies, who are at present quarreling with their directors or their managers in this country [England], and are attributing their diminished dividends to mismanagement, will do well to study the report of the International Range Association. This organization was the outcome of the convention of cattle owners recently held in Denver. It declares that such a producers' combination as this is ominous of trouble ahead, even for a "ring" so immensely powerful as that which owes its existence to the so-called "butcher kings" of Chicago. All roads lead to Rome, and it is becoming exceedingly difficult for the Western producer, whether of cattle or corn, to clear his produce for the Eastern seaboard without leaving his entire profit in the hands of one section or another of the Chicago middlemen. It is notorious that these gentlemen have obtained such freight concessions from the trunk line railroads between Chicago and all Eastern points that they have secured the complete monopoly of the Western meat trade. In addition to this, the Western farmers and ranchmen in these depressed times have become largely indebted to Western banks, and these banks are in turn controlled by the great wealth of the Chicago kings. But the countermeasures thrown out by the Convention at Denver, which promises to combine and control all the local stock associations from the Gulf of Mexico to Puget Sound, may well commend the consideration of this, the greatest ring America has ever known.

So it appears that the railroads are getting the chief portion of the profits of the British cattle companies. It also appears that these foreign investments have served the useful purpose of lessening the price of beef in this country, and such being the case no one here is disposed to find much fault. At the same time the occupancy of such an enormous area of lands by these capitalists is a constant source of irritation and adverse criticism on the part of our people; but if they don't make any more money for the next year than they did last, they may be willing to sell out cheap, for there is such a thing in this country as a man or a company becoming "land poor."

The kind of capital which is most beneficial to our people, however, is that which is seeking investment in the manufacturing and producing interests in the Eastern and Southern States. A large number of plants in the silk, wool, cotton, and iron business have recently been either removed to this country from England, or established here as new enterprises. As a general thing the owners of these enterprises accompany them and bring large numbers of their own workmen to run them. Such investments add to the permanent and material wealth and population of the country, and should be, in every proper way encouraged. Uncle Sam can, and is ready to take them all in and do for them as he would for his own native-born children.

We notice among recent movements in this direction one in the *Iron and Steel Trades Journal* for May 19th, that the preliminaries

have been settled and a company formed for producing metals from the rich mineral resources at Talladega, Alabama, under the auspices of Mr. G. W. Chambers. About six months ago, Mr. Joshua Lancaster, managing partner of the Mostyn & Darwen Iron Company, paid a visit and made a careful inspection of the mineral lands in Alabama, and the result of the visit is highly favorable. A company has been formed with a capital of £100,000, and it is proposed to erect a blast furnace for smelting the rich minerals of that district which abound with valuable deposits on the property of Mr. Chambers. The minerals comprise manganese, specular ore, and brown hematite, and the company will undertake the making of chrome iron, manganese, spiegel and hematite metals.

Improvements in Warfare.

One of the most interesting features of modern progress is the influence or modes of warfare exercised by scientific and mechanical discoveries. The entire practice and paraphernalia of warfare has been revolutionized within the past 30 years. The armored ship, the heavy guns made possible by modern improvements in manipulating iron, the use of machine guns for service as small arms, improvements in explosive material, the much greater efficiency of shells due to improved explosives and especially the very latest improvements in employing these new explosives, by the use of pneumatic guns, etc., are all marvels of progress in the way of destruction.

The bicycle will be made to supersede the horse under certain circumstances in the next great German war, and dogs are also being trained by the French to harass and worry the enemy. As a finality of all these improvements, we now hear of

An Electric Sword.

This letter is certainly a shocking if not a most efficient and deadly weapon, which strangely enough comes to us from China, where all things seem to have had their beginning. A soldier in using this weapon has an electric battery concealed in his waist, with insulated wires running to the sword. When the point of the weapon touches an adversary, the latter is paralyzed, and the wielder of the sword can be said to have made an electric charge. There is much that is curious and possible in connection with this latest invention of our celestial neighbor. The victims are not hewn down in a slow and bloody death. They perish quickly. Of course, such scientific execution would take away much that is poetical about a battle field. "Rivers of blood" would no longer flow nor "gory pools" be seen. In the electric sword there is much that is scientific and practical. If warfare is really necessary to man's existence, let it be kept as near abreast of the times as possible. Possibly the electric sword may prove an important advance in the construction and use of the great symbolic instrument and enigma of war. But perhaps some genius may yet outdo Franklin by the invention of some form of lightning conductor which will shield an army from a charge of electric words. Something similar has heretofore been the result of all the modern improvements in this direction. One inventor devises some new mode of defense or attack and another inventor immediately brings out some other device to overcome or supercede the latest improvement. It is to be hoped that this mode of procedure will be continued until all modes of warfare become so inglorious or so generally fatal that men will no longer engage in such an inhuman and unnecessary mode of settling international disputes.

LITTLE INDUSTRIES OF THE SOUTH.—Small industries are springing up all over the South. Wagon works, furniture works and works for many other industries in wood and iron are being established to produce at home a large portion of the articles which have heretofore been imported from the Northern and Western States. These minor industries are prospering all over the South where they are properly conducted. The character of the work is improving, and the improving demand for good wagons is leading to further enlargements and additions. There is no good reason why Southern wagons should not sell in Northern and Western markets, and enterprise will yet solve that problem.

SHOP NOTES.

Do Tools Grow Tired?

A correspondent of the *Iron Industry Gazette* says: Tools, like men, grow "tired." I have seen a first class chisel get "tired," and act as though it was possessed of the King of Sheol. It would not keep its edge, and the more I sharpened it the sooner it would lose its edge.

I called the attention of a shopmate, a grizzled old veteran, to the peculiar behavior of this chisel. He looked it over and handed it back to me, saying: "The tool is all right only a little tired. Lay it away and let it rest. It will come out all right again, just like a man who is tired."

I did not believe this old fellow, and I really thought he was crazy to talk of a tool getting "tired," but as there was no help for it the tool was laid away. I do not remember how long it was left to "rest," but when it was again sharpened and used it appeared to hold its keenest edge as well as it did before it got "tired." Barbers tell me their razors in constant use get "tired" in the same way, and woodchoppers say their axes sometimes seem to get "soft" all at once.

Possibly constant and hard usage may cause changes in crystallization that would account satisfactorily for the peculiarity alluded to. Locomotive engineers often observe peculiar misbehavior in their machines, which may possibly be the result of continued heating, friction, and pounding. When a tool gets "tired," or a machine "balky," give each a rest.

Mechanics who are not well informed, in these days of cheap valuable books, have only themselves to blame. Generally the tool handler who "gets on" in the world is the one who has read what has been printed concerning his work. When a foreman is incapacitated by sickness or accident, it is the intelligent subordinates who are called to fill his place either temporarily or permanently.

Orderly Shops and Good Tools.

There are few mechanics who realize the importance of keeping their tools in perfect order; nevertheless the experience of every one having to work with a set of tools ought to prove that he should love his tools and regard them with pride. We sorely recollect a single instance of a really good workman who did not possess this affection for, and pride in, the implements which enabled him to turn out his work well.

If hammers are rusty and with faces covered with careless nicks, and fitted with ill-shaped and broken handles; if sharp-edged tools are badly ground and covered with rust; if cold chisels are made very much like old shanks taken at random from the scrap-pile, and litter, dirt, tools and fragments are clustered together in a close conglomeration, it will convey about the same idea to the observer that a beggar in tattered habiliments would in the parlor of a prince. Every one would feel a great desire to either eject the intruder from the apartment or at once leave the place himself. There are instances where this affection for and pride in implements have gone extremely far and become almost a monomania; so much so that the journeyman could scarcely bear to see you examining his chisels, files, etc., and seemed to have a fear, whilst you were looking at them, of some outward effect like that which the Indians attribute to an evil eye, but which merely arose from a species of selfish affection for these children of his handicraft.

Every tool should have a place and be kept there when not in use. The amount of time saved in a year by having everything in order is astonishing. It often happens that when a job is to be done in a hurry there is more time wasted looking for tools than would be required to do the job. This does not pay, and, besides, the customer goes away in an unpleasant condition of mind, and will not be apt to take another job to that shop if he can help it; but he will be almost glad of the opportunity of visiting the shop where work is done promptly and pleasantly. The people soon find out the best shop to deal at, and the best shop gets the cream of the trade, while the old fogies growl and grumble while the dust is settling on them, which they are too lazy to shake off.—*Mechanics.*

Forty Years Ago.

Forty years ago, in the machine trade, planing machines were the exception; the hammer and the chisel were the only reliance for obtaining plane surfaces. In those days men chipped and filed, and removed pounds of iron by hand, where machines now remove ounces only to accomplish the same purpose.

Forty years ago castings were made much heavier and rougher than they now are, and were not so sound. Pattern-makers were instructed to allow more stock to finish, and blacksmiths compelled machinists to do work on the lathe and in the vise, which should have been done at the forge. Their forgings were rough and covered with scale, and they ran close to the size in places where it was all straight work, and far away from it in others where it was hard work to get the stock off. Forging, in most cases, were only an approximation to the thing required.

Forty years ago the milling machine was unknown. The seed or germ of it was the "slab-

ber," for milling off hexagon nuts and bolt heads. These nuts were often chipped and filed than any other way; but when a specially nice job was required, they were strung on a mandrel and planed.

Forty years ago the lathes in use were poor machines compared to the present tools. The "slide lathes," as it was called, was confined to straight work and boring; anything that required exact workmanship was done in hand-lathes.

Forty years ago tradition ruled in machine work, and book lore had no part or lot in designing or constructing. Men followed the plans of their fathers, and any departure or innovation was but slowly adopted. There were no text-books or hand-books, and technical schools were unheard of.

Forty years ago steam worked expansively was the exception; full stroke was the rule everywhere, and steam pushed the piston to the very end of the stroke, the valve only closing in time to open again. Piston speeds were slow, friction was an enormous percentage of this power, and boiler pressures of 50 to 60 pounds were considered high.

Forty years ago the condition of the machines and workmen was far below what it now is. In 40 years the social status and appreciation of craftsmen generally have advanced. Legislation has had no part in this. Men cannot be voted into intelligence, and an ambition to learn the why and wherefore of their callings. Example and individual achievements have raised the mass. Men have emulated the efforts of others who rose from poverty to affluence by hard study.

The improvements in machinery have also aided the multitude, and the trades stand higher, are more intelligent, more economical, better citizens, in short, than their fathers.—*Mechanical Engineer.*

PULLEY AND BELT.—There is a tendency among machine builders to use pulleys that are too narrow for the belts to drive with, for the reason, perhaps, that a wide-face pulley will give the impression that a large amount of power is required to make them operate; so narrow belts are prepared with the idea that they can be laced up till the machine is set in motion. It would take a great deal of the load from off the bearings if the wide belts could be used, that they may not be strained all out of shape in transmitting power to this driving shaft.

BEARING SURFACES.—Too much bearing surface, if badly fitted and poorly lubricated, may be much worse than too little surface. A notable case illustrating this is said to have occurred in the United States Navy some years ago. In order to provide plenty of bearing surface, the crank shaft was carried in frames 4 feet long, the shaft being about 13 inches in diameter. All the resources of the engineering could not keep these bearings cool, and they had ultimately to be reduced in length one-half.

Good Mining Superintendents.

The greatest need of the Black Hills to-day is of men with experience to superintend and work the mines. The experience of the past in this country, unless it be entirely worthless, will justify this statement. If the money that has been unprofitably and unwisely employed and wasted through incompetent management, and through impracticable undertakings could be estimated it would be found there would be enough, if placed in the hands of good practical miners, to develop the entire resources of the hills. All will agree to this upon a moment's reflection. We have but to think of the enterprises undertaken and abandoned, the hard and costly labor performed and lost, most of which as regarded now was undertaken without due consideration and with but little chance of success from the start, and the wonder then becomes how it is possible that men could act so rashly and with so little judgment in matters involving so much labor, time and money.

The explanation of this is not difficult, however. This was done in times of great excitement, when fortunes were expected to be made in a single year and the lavish outlay of a few hundred thousand dollars in work in any part of this golden region was expected to develop in return a mine with several times the amount expended. Men did not stop to reason calmly or to weigh the chances of success or failure; they inverted almost entirely upon the theory, "nothing risked, nothing gained," which is a true one properly interpreted. It was not meant, however, that the risk should be taken without the slightest consideration of the chances of success.

The superintendence of a mining company is a most important and responsible position, and the man chosen for such a position should be a man of long experience in practical mining. That a man who combines all the qualifications for a successful superintendent is difficult to find is very evident. There are not very many of them out of a job or waiting for an offer. They are picked up eagerly and paid large salaries by companies that understand the value of having such persons at the head of their enterprises. But men of this character can be had by paying them sufficient for their services. They are a restless class of men generally, ready to go to a new place upon a liberal offer and eager to build up a reputation among a new people.—*Deadwood Pioneer.*

STEAM BOILER NOTES.

Softening Your Hard Water.

The enormous waste of fuel, and damage to boilers, consequent on the use of "hard" water, carrying in solution a large percentage of lime, should incite some one to devise some means to purify such water before it enters the boiler, remarks the *Stationary Engineer*. The great expense and loss of service imposed upon railroad companies by the use of lime water in locomotives, should have led to some plan by which this lime in feed-water could be eliminated. That it has not been done effectively before this is occasion for surprise, to say the least. True, we have a vast array of devices and compounds that propose to keep boilers clean, and plenty of testimonials are shown to prove that they do it, but these are remedies, or means, for removing the deposits left when the water is evaporated.

Practical men of experience with steam will admit that it ought to be easier to remove the lime from the water than to clean the scale from the shell and tube, after the heat has caused it to deposit and adhere closely. In view of the general diffusion of chemical knowledge among all classes in this nation, it is surprising that the steam-users and engineers have not given the subject more attention. That carbonates of lime can be removed from water by changing its condition or form, should have occurred to some one before this, and that it can be done easily and cheaply ought to have been demonstrated before this.

The carbonates of lime which makes water hard, is kept in solution by the presence of excess of carbonic acid; now if caustic lime-water be mixed with hard water, sufficient to neutralize the carbonic acid, the lime added and that in solution will be precipitated as lime carbonate, its specific gravity being greater than water. The water being left to stand without agitation, until the lime has settled at the bottom as a white mud, the clear water can be drawn off.

A part of the precipitated lime may be drawn off, if proper precautions and care are not present, to prevent this result. There is no reason why all steam plants and watering stations that are troubled with lime-water cannot adopt this simple and inexpensive plan for securing water that will be cheaper, cleaner, and less damaging than hard lime-water.

EXHAUSTING BACK INTO THE BOILER.—A gentleman in New York has contracted to furnish about \$10,000 for building an experimental engine of recent invention. The invention is nothing less than an engine which shall exhaust back into the boiler, instead of into a condenser or the open air. That is, the steam which has pushed the piston through a full stroke is to be forced back into the boiler by the same piston. If the invention can be made a practical one, it will be of great value, for if the steam can be exhausted into the boiler the loss from friction and radiation will be so small that from 70 to 80 per cent of the fuel used to drive an engine will be saved. The engine consists of four single cylinders, two being placed horizontally, one above the other, on each side of the shaft to be turned by them. The pistons are connected with the shaft, so that the piston in the upper cylinder on one side works in conjunction with the piston in the opposite lower cylinder. Steam being admitted to either pair of cylinders, the pistons are forced out to the end of their strokes and the shaft is turned half-way round. At this instant they are, by means of cogs, two cams and a link, uncoupled from the shaft and connected with each other, becoming as one piston, with the steam pressing equally on each side. At this moment the other two pistons are coupled to the shaft and forced by the steam to the end of their stroke, keeping the shaft turning, and pushing the other two pistons to the heads of their cylinders. The second pair of pistons are then uncoupled and treated in the same way. The theory is said to be correct, but the machine somewhat cumbersome, and perhaps slow motioned.

COPPER VS. IRON OR STEEL PIPES.—The London *Engineer*, in discussing the subject of copper steam pipes, brought up by the explosion on the British steamer *Elbe*, recently remarked: The question deserves consideration. Why use copper piping at all? It is difficult to see what precise advantage it possesses over good lap-welded steel or iron tubes. It appears, moreover, that a very good pipe might be made of thin steel riveted. Such a pipe could not be caulked steam tight, but might be brazed steam tight, its strength depending mainly on the rivets, while the brazing would be a substitute for caulking. Now that a doubt has been cast on the merits of copper for high-pressure work, it is possible that some ingenious individual will produce something as new and as suitable for its intended purpose as the corrugated flue which render high pressure possible at sea.

THE TEST PRESSURES OF MARINE STEEL BOILERS.—At the sessional meeting of the Institution of Naval Architects, recently held in London, Mr. R. Sennett (chief engineer of the admiralty) read an important paper upon "Working and Test Pressures for Marine Steel Boilers." He explained that the old bad traditions in regard to testing boilers had been

shaken off, though their influence was not yet dead, and by slow degrees it had been realized that the ordinary rules of mechanics might be applied to steel boilers as safely and as surely as to any other structures. The "factor of safety" in the working steam pressures allowed to be carried with a given thickness of plates, was to a great extent an allowance for want of knowledge. But the necessity for this no longer existed, since with the introduction of high steam pressure and steel plates much greater attention was now paid than formerly to materials and workmanship.

CAN A STEAM BOILER OR PIPE BECOME HOT ENOUGH TO IGNITE A MATCH PURELY FROM HEAT, WITHOUT THE LEAST POSSIBLE FRICTION? At what heat would it ignite, and what would be the highest number of degrees of steam heat that could be brought to bear upon the outside of a steam boiler under pressure? Also, could steam pipes set fire to anything else? A. A phosphorus match will ignite at 140 degrees Fahrenheit; steam at the boiling point is 212 degrees; under high pressure of 240 pounds to the inch steam can be heated to 403 degrees, but this is not hot enough to set fire to wood, as dry pines wood ignites at 500 degrees, and charcoal at 580.—*St. Paul Pioneer Press.*

Nevertheless we have seen it! A pine board laid on pipes through which super-heated steam was passed from the boiler to an oil retort charred black in a few hours. The woodwork on which heating pipes were hung 300 feet from the boiler became so charred that the screws let go and the pipes fell down. We can cite actual occurrences by the dozen.—*Insurance Monitor, N. Y.*

STEAM VS. WATER POWER.—The cost of steam power in small amounts is greater than in large amounts, but for mills requiring 500-horse power or more as economical results can be obtained with steam as with water, in almost every case. To this add the advantage of a uniform steady power, independent of the rise and fall of a river and the saving which this may mean; also consider the better results attained by steam power and we can plainly see why this statement is practically proved at Fall River and elsewhere, and there is no better proof than this that steam mills can successfully compete with other mills driven by water power.

THE CORLISS VS. SLIDE VALVES.—The fact that a long-stroke Corlies engine is more economical than the best constructed slide-valve engine is sufficiently proven by the further fact that a good Corlies engine will, for a term of one year, five years, or any number of years, save one-third the fuel required by the best slide-valve engine ever built to develop the same amount of power, running under the same conditions. There are numerous instances where the change from a slide valve to a Corlies engine has demonstrated this to be a fact; but no instances where any gain in economy has resulted from changing from a Corlies to a slide-valve engine.

TO PREVENT FOAMING.—The evil effects of foaming may be in a measure remedied, and much drier steam delivered to the engines by using flaring connections on the boilers with wide mouth for the entering steam. The action of steam flowing from the comparative quiet of the boiler to the high velocity in the pipe produces something in the nature of a violent suction at their connection. In the opening where this suction is small the intensity is concentrated so that water is likely to be drawn over in the form of spray, while if the opening is large the steam starts gradually, leaving more time for the water to separate and fall back.

TO AVOID TEARING THE MANHOLE GASKET.—On opening a boiler much trouble is often experienced from the tearing of the manhole gaskets; this may be avoided by putting a little white lead on the face of the gasket that rests on the manhole plate, and by chalking heavily the other face of the gasket, as also the part of the manhole frame with which it comes into contact. On subsequently opening the boiler the gasket will generally be found to adhere firmly to the plate and to separate from the frame without tearing.

REPAIRING STEAM PIPE BREAKS.—An ingenious means of repairing a break in a steam pipe consists in hindering the break with wood strips, laid close together, and well served around with stout cord or rope, endwise separation being prevented by more rope crossing the break diagonally, and tied so as to draw the broken parts together; on the wood and the cord getting wet with steam, the joints become even tighter than before, as the wood swells and the cords shorten.

CASTOR OIL IN BOILERS.—A writer in the *American Machinist* recommends the use of castor oil in boilers where alkaline water is used. He says that from two ounces to a pint of oil will prevent foaming all day. The oil is put in after the engine shall have started if foaming shall begin.

WASTE SILK has been shown to be the most effective non-conductive covering for steam pipes. The price is high, but the demand is very great.

COTTON AND WOOL.

Evolution of Cotton Seed.

Was ever there a history, this side of Cinderella, of the uprising of humility, like that of cotton seed? See!

For 70 years, despised as a nuisance and burned or dumped as garbage; then discovered to be the very food for which the soil was hungering, and reluctantly admitted to the rank of ugly utilities.

Shortly afterwards found to be nutritious food for beasts as well as soil, and thereupon treated with something like respect.

Once admitted to the circle of farm husbandries, it was found to hold 35 gallons of pure oil to the ton, worth, in the crude state, \$14 to the ton, or \$40,000,000 for the whole crop of seed.

But then a system was devised for refining this oil up to a value of \$1 a gallon, and the frugal Italians placed a cask of it at the root of every olive tree and then defied the Borean breath of the Alps.

And then experience showed that the ton of cotton seed was a better fertilizer and a better stock when robbed of its 35 gallons of oil than before, and that the hulls of the seed made the best fuel for feeding the oil-mill engine. It was next discovered that the ashes of the hulls scooped from the engine's drift had the highest commercial value as potash, and that the "refuse" of the whole made the best and purest soap stock to carry to the toilet the perfumes of Lubin or Colgate!

About this time people began to spell cotton seed with capital letters.

Next it traveled abroad in its various dresses. As meal cakes it whitened the meadows of England with woolly fleeces and fattened the British cattle under the oaks; it spattered on the stoves of the Dutch in lieu of lard; it glistened in the cafes of Paris as olive oils under seals and signatures it couldn't even pronounce to save its life, and from under the dikes of Holland it went forth to parade in all the bravery of butter and butterine.

In our own country it removed the wasting strength of Southern fields and clad them with whiteness that would shame the fleeces of England, or yellow that would pale the fleeces of Argonauts. It knocked the Western hog into spots and ponied the Western lard out of the fryingpan into the fire. It furnished the Armours and Fairbankses with a pure substitute for the rancid fat they had been shipping us, and suggested the possibility of a clean and cheap lard.

And about this time Congress jumped on to cotton seed with both feet, and proposed to check its further career by a prohibitory tax.

And now comes a gentleman with a process by which he extracts 30 gallons of fine oil from every ton of cotton seed meal after the oil mills have done with it. In the "tailings" of the oil mills he finds this unexpected and ample store, which he deftly extracts with naphtha, leaving the meal more nutritious as food for beast or field than before he took \$10 per ton from it. This invention will add 40 per cent to the quantity of oil taken by the old process from a given quantity of seed.

More than this, it suggests the splendid possibilities yet undeveloped for this rare Cinderella that has risen all so swiftly from the ashes of the waste heap.—*Atlanta Constitution*.

Reclamation of Waste Products in Wool Scouring.

Too little attention is paid in this country to the reclamation of waste products in most of our manufacturing operations, and none, probably more than in the washing and manufacture of wool. Our French and German competitors are far ahead of us in taking advantage of any new discovery in connection with the industrial arts; in fact, almost all new discoveries and their application to the industrial arts are the product of European brains, and with all our boasted go-aheadness as a nation, we are behind the times in a great many respects. These are facts which cannot be denied.

Wade's *Fibre and Fabric* refers in this direction to a patent which has recently been issued in France to M. Marx for a new process of utilizing the residue from wool scouring, by which the waste liquor is passed through a coarse cloth stretched on a wooden frame formed like a baker's trough, by which all the wool and coarse matter in suspension are removed. The waste is then allowed to overflow into a gutter of masonry which is partially barred at intervals by blocks to arrest the solid matter in the form of mud, which is then sold as a most valuable manure. The water is then received into a large cistern, where it rests for several hours, and deposits the rest of the matter in solution. It is then drawn off by a pump into a wooden vat, and is mixed with sufficient hydrochloric acid to saturate the free alkalis and that which forms part of the soap, decomposition takes place, and deposition in three layers. The middle layer, which has a milky appearance, contains various animal matters; the upper and lower layers contain fatty acids and also a matter the same as the middle layer. The middle layer is conveyed into a cylindrical vessel charged with large pieces of limestone which disengages the hydrochloric acid from its first combination, forming chloride of lime,

which remains in solution. From this vessel the water runs into another containing milk of lime, with which it is mixed until there is a decided disengagement of ammonia. The solid matters then fall to the bottom. The two other layers, now mingled by the withdrawal of the middle one, are thrown upon another filter of the same kind which retain the fatty acids.

The development of this industry is due principally to Mummé and Rugelet, whose process in operation at most of the great seats of wool manufacturing is very simple. They evaporate the waste liquors to dryness and place the residue in retort and distill it in very much the same manner as coal is distilled at gasworks. The result is that while much gas is evolved, which is used to light the factories, and much ammonia is expelled, which is collected and used in many ways, there remains a product consisting of carbonate, sulphate and chloride of potassium. These salts are separated by the usual method and pass into commerce.

It has been shown by Chevreton that the wool yolk forms at least one-third of the weight of raw merino wool, and that this wool yolk is a peculiar potash compound which the sheep draw from the land on which they graze, and which is eventually excreted from the skin along with the sweat. According to Mummé, a fleece weighing four kilogrammes contains 600 grammes of grease, in which is 193 grs. of pure carbonate of potash; and according to data published since, 1000 kilogrammes of wool yield 140 to 180 kilos. of dry salt or 70 to 93 kilos. of potash. At the wool-washing works of Döhren, near Hanover, they get 152 kilos. of raw potash out of five tons of wool, and it contains 80 per cent of carbonate. In 1867 Mummé and Rugelet produced at their works at Rheims and Eberf 150 tons of pure potash from grease, and there are similar works at Roubaix, Antwerp, Vorviers, Liège, Bruges, Hanover, Döhren and Bremen.

These are facts that cannot be denied, and as this industry is in successful operation in France, why cannot it be done in this country and in this State as well, and these valuable products that are at present going to waste and polluting our rivers and streams, be reclaimed and utilized?

COTTON CULTIVATION IN RUSSIA.—Russia, it appears from the statement of the *Novosti*, imports annually 360,000,000 pounds weight of cotton, chiefly from America and Egypt. The recent acquisitions in Central Asia of the Czar are said to have given him territory well suited to the cultivation of this article, and the Russian papers are asking why the country should continue to pay 100,000,000 gold roubles to the foreigners when they can grow it at home. Some Asiatic cotton from Khiva and Bokhara has already been sold on the Russian market, but the prospect from the new plantations on the Murghab is still more promising and abundant. The Czar's domain on that river, where General Puckled and the expert M. Poklevsky Kozell have been making experiments, is considered especially well suited to this particular cultivation. M. Poklevsky believes that after the restoration of the Sultan Bey dyke this tract alone will be sufficient to supply the whole deficiency of the Russian Empire. The preliminary essential to these operations is the completion of the irrigation works, and as these will occupy the next two years, it is uncertain till they are achieved whether cotton or some other crop will be the most remunerative.—*Cotton Factory Times*.

OUR AMERICAN ANGORA.—The foundation of the American Angora flocks was imported from Asia. Richard Peters of Georgia, we believe, was the one who brought the first into this country. Fehulous prices were paid for these animals. The stock was introduced into California and Texas, the now principal Angora districts of America. For years these breeders have found a larger demand for their mohair than they could supply, high prices were realized, and the majority of those engaged in this industry have become wealthy. Of late, however, the prices for hair have declined so that many have abandoned the business. We do not think that any goats have been imported for some years past. Do not see why it cannot be made profitable; they require much less care, and will subsist on food that sheep will not touch. They are much harder than the hardest of sheep. Hair sells all the way from 35 to 50 cents per pound. We cannot see why they could not be raised with success in the Southern and Southwestern States and Territories.—*Sheep breeder and Wool-grower*.

THE QUALITY OF COTTON.—The cotton brokers declare that the cotton now in use in Fall River is the best that was ever landed there. If this is so, and there is little reason to doubt the brokers, the spinners have lost one of their causes of grievance. Some of the members of the Spinners' Union had made plans to ask the manufacturers for better cotton during the summer months, but this will not now be necessary. The manufacturers have come to the conclusion that the best is the cheapest in the long run. The mills are prosperous and there is a strong probability that business will be good and the factories running full time.—*Ex.*

COTTON-MILL BUILDING in the South is being pushed with almost blind zeal. Within two months announcements have been made of 60 new mills. One at Athens is to double its capacity from 5000 to 10,000 spindles. A

thread factory is to be built near Barnett Shoals, Ga. A Merchantville, N. J., projector will put up a large amount of knitting machinery at Morristown, N. C. Spartansburg, N. C., is to have a \$100,000 mill.—*N. O. Times-Democrat*.

SHEEP SHEARING is actively progressing in Eastern Oregon, and wool is already being hauled to points on the railroad. The clip being hauled to Arlington and the Dulles is in fair condition. The staple is better than last year, except from localities where the ranges are crowded. Umatilla and Snake river wools are average in appearance. Union and Baker counties show a heavier clip, owing to the introduction of better blood. Grant county wools are light, and on the whole the clip of Oregon may be considered five per cent heavier in shrinkage than last year, but wools classed as railroad wools by the trade are as much as 10 per cent heavier.—*Portland Chronicle*.

EVOLUTION.—The cotton seed become cotton, the cotton becomes thread, the thread becomes a fabric, the fabric becomes a print, the print becomes a wrapper, and the wrapper becomes a beautiful woman.—*N. Y. Sun*.

Flour Mill Notes.

A Flour-Mill Run by Electricity.

Some Very Remarkable Results Obtained by this Power.

The *Electrical World* gives an illustrated description of the Laramie Wyoming Milling and Elevator Company's flour-mill, operated entirely by electric power.

The mill is a fine specimen of design and workmanship throughout. Its capacity is 100 barrels of flour per day, and it turns out work in this proportion regularly, without crowding.

The mill is equipped with steam heat, the Edison electric light and Sprague electric motors. These motors are used exclusively for the power to drive the mill. All parties interested are entirely satisfied with the power now in use; it is not probable a change will ever be made in this respect. The mill machinery consists of seven double sets of rolls 7x18 inches each, with purifying machinery of a capacity equal to the rolls.

The power is divided in units of 25 horsepower each. One motor in the corner of the building drives all purifying machinery on the floors above, also the wheat (cleaning) machine, and all elevators and conveyors, which, if they were all stretched out in one line, would measure over a mile in length. The other motor runs the seven double sets of rolls and the flour-packers.

From the experience gained, Mr. Jones, the manager, would advise mill-builders who use electric motors to subdivide their power into three units, by taking all wheat-cleaning and scouring machines, and all elevators and conveyors running directly in their interest, from the purifier line, and to apply a motor of proper capacity directly to them by means of a countershaft. This he would suggest owing to the intermittent use of these machines, especially where the wheat-dampening process is used.

He maintains that he has a lower percentage of loss of power than he would obtain from an engine placed in a building prepared for it alongside the mill, counting the necessary loss by friction in running long shafting and belts, as is invariably done. The arrangement just suggested, a subdivision of power into three units, would reduce the friction and be preferable, as cleaning machines could remain idle much of the time; and, besides, the present quantity of shafting and belts would necessarily be reduced.

Remarkable Results Noted.

The motors in the Laramie mill run at constant speed. Mr. Jones states they are more constant as to any sudden change than the best-regulated automatic engines in the market. The only change they are subject to is a gradual, but slight, increase in speed from the time of starting until the day's run is complete. This increase appears to be due to an increase in the temperature of the armature, and has been found to be in these proportions: Thus at starting the roller line shaft makes 219 revolutions per minute, which is the right speed, at night the speed has increased to 224 revolutions, and at intervals during the day the speed varies in almost true proportion, which result is more uniform than engines will give.

The motors are wound for 220 volts, but are run at 226 volts, and it requires in current an average of 150 amperes to drive the mill to its full capacity. A variation of pressure on these machines will vary the speed in about the same proportion as steam pressure will vary the speed of the best engines. So far as observed, a variation of one volt electrical pressure will produce about the same effect on the motors as one pound of steam pressure would vary a good automatic engine. However, it is easy to control electrical pressure to within one or two volts, while it is difficult to control steam pressure within the limit of a few pounds, which shows that the motor is superior as to variable changes in speed.

Electricity in an Iron-Rolling Mill.

Mr. Jones has been so well pleased with the work of the electric motors in the flour-mill that he has recently placed a 20 horse power Sprague motor in the Laramie rolling mills,

which now runs about 120 feet of three-inch shafting, containing many heavy pulleys. This shaft drives four spike machines, two bolt shears, two nut presses and a large quantity of threading and tapping machinery, including some emery heads. It takes less than 20-horse power to drive this shaft, and it delivers a uniform speed to all machines. Previous to placing this motor, the power was transmitted nearly 300 feet by belts and shafting, and probably required nearly 50-horse power to do the same work now done with less than 20.

How the Motors Increase the Working Capacity of the Men.

Careful observation has shown that the rolling-mill men are doing much more work now than by the old-belt system, owing to the fact that during much of the time speed was so slow, caused by low steam, that some of the machines had to be shut down.

A Flour Trust.

A convention of the flour millers of the United States met at Buffalo, N. Y., during the past month. It appears from the proceedings, so far as we have received them, that the millers have also fallen into the general desire to form a "trust." The proposition is to enroll all the leading millers of the country into the organization. When that is done the organization will be in a position to dictate the price of wheat and flour for home consumption, and another price, if deemed advisable, for export. The plan also involves the abrogation of the present 20 per cent tariff on foreign wheat. This is simply a new movement to place the control of the bread stuff of the country in the hands of a few speculators; a movement much more easily effected and involving far less capital than the "corners" in wheat heretofore attempted, that is, provided the proposed organization can be accomplished.

The *Call* of this city comments upon the matter as follows: "They," the millers, "want the duty on wheat removed. It is not necessary to travel far a-field to discover what the object of the last proposition is. The millers in convention ask no less than that the American farmer shall be delivered over to them bound hand and foot. This is what the woolen manufacturers were encouraged to do with regard to the wool-growers—the fruit-canners in the matter of tin plate to the fruit-growers. The 20 cents per bushel now charged as duty on Canadian wheat saves our farmers from the clutches of the millers just to that extent. If the duty were removed they would have to come down to Canadian prices, when transportation charges were equal. Our farmers would lose what may be called the border trade in wheat altogether. Canadian wheat can be laid down more cheaply in Buffalo than wheat from the interior of the State of New York.

But the special point to be noted is that the millers do not think that they can succeed in setting up their "trust" unless the duty on wheat is repealed. They want to use foreign wheat as a club to beat down the prices of our own farmers. But President Cleveland gave expression to the opinion in his last message that it is the tariff which has made "trusts" possible. Some of his defenders have asserted that it was the 75 cents per ton levied on coal which has sent the price in this city from \$7 to \$17 per ton. Other wholly wonderful results have been noted in other parts of the field. But the millers in convention have knocked the bottom out of the absurd notion. The "trusts" which are strongest in this country are those which are least protected.

British and American Wheat-Growing.

The English economists are puzzled by the problem presented by wheat cultivation in India. To that they ascribe many of their woes and many of the uncertainties of the future. The first export of wheat from India was in 1868, and the quantity was 559,000 bushels. There was a slow increase for a few years until 1876, when the amount was 4,687,000 bushels. In 1881 the amount was 13,896,167 bushels. For the six years, 1882-87, the average export has been 35,530,000 bushels. In the earlier years most of this wheat went to Great Britain, at least four-fifths of it; but latterly, say 1882 to 1887, the proportion has been less than one-half. The price of India wheat at the place of export has been a few cents less than that of our wheat, but the ocean freights have been about as much in favor of the American product and on arrival the latter is found to be cleaner and better, and is not prejudiced for best uses by the India grain. Much has been said and written concerning the possible rivalry between the wheat product of India and that of the United States, and the possible expulsion of the latter from the markets of Europe. This possibility may be regarded as very remote for various reasons; such as the imperfect methods of culture and harvesting in India, the cost of interior transportation, the inferior quality of grain, the necessity of irrigation, etc.

India raises one bushel to a head of the population, the United States, even. India has one mile of railroad to 20,000 people, the United States one to 435. The people of India require by far the largest proportion of their wheat production for food and seed (and their home appetite increases every year) while the people of the United States, after appropriating five bushels per capita, have a surplus for export equal to one-half the entire crop of the British Empire in the East.—*American Agriculturist*.

Coast Industrial Notes.

THE Tanners, Curriers and Finishers' Union of this city now numbers some 200 members and is making rapid progress.

THE cultivation of bamboo for fencing material has been begun in California. It is said that an acre will produce pickets enough each year to make six miles of fence.

ONE side of the Pacific Lumber Co.'s mill at Scotia, says the *Humboldt Standard*, has been shut down to remain until there shall be an increased demand for lumber. We are told that some 140 men are thrown out of employment by these suspensions.

THE Puget Sound Loggers' Association has unanimously agreed to curtail one-third the output of logs for the balance of the year, commencing July 1st. It was generally agreed that too many logs were being put on the water to keep prices at living rates. This association represents three-fifths of the logging interest on Puget sound, and the action taken will make a difference of 80,000,000 feet in the output for the rest of the year.

A LETTER from Sutter Creek, Amador county, says: "Operations have commenced at the new sawmill of Tarr Bros. They say it works charmingly, and is good for 15 years. In fact there are not many better to be found in the State. The supply of first class lumber being abundant, this mill ought to do a rushing business, notwithstanding that it is further off than the other mills. An excellent road all the way obviates to a great extent the extra distance."

FORTY-FIVE THOUSAND shingles manufactured at the Frazier mill, says the *Visalia Times*, were brought to this city on Tuesday last and sold to the San Joaquin Lumber Co. This is the largest lot of home-manufactured shingles ever brought to this city at one time. Heretofore the shingles on sale in this county have been manufactured on the coast or in Washington Territory, but now that our own people have engaged in their manufacture the money to be expended for them will be retained at home.

THE California Sash, Door and Blind Manufactory, located in West Oakland, which has the largest capacity of any in the State, has been closed. How long it will remain inoperative is not known. The mill is owned by a syndicate of capitalists of San Francisco, B. and J. S. Doe being prominently interested. The factory was formerly operated at San Quentin by convicts, but after San Quentin authorities refused to take this work longer, the company built the West Oakland mills.

MAY was the banner month of exports from Puget sound, surpassing all others, 38,302,816 feet of lumber being exported from the nine ports of the Sound. Tacoma was in the lead, shipping 9,985,215 feet. The coal shipments were 57,842 tons, Seattle leading with 36,520 tons, and Tacoma shipping 21,340 tons. The total exports from Tacoma for the month of May, including lumber, coal, wheat, flour and merchandise, are valued at \$434,540, and from all the ports, \$1,215,270. The tonnage was 88,568.

THE San Bernardino *Index* says: The San Bernardino, Arrowhead & Waterman motor road has been completed as far as Harlem, and henceforth regular trains will be run to that popular resort. The timber industry alone would justify the building of the road, to say nothing of the local traffic. It will enable the timber-growers and millmen in the mountains to place their timber in this market several dollars per thousand cheaper than at present, the only transportation now being by means of freight teams.

THE new steel steamer Pomona, just completed by the Union Iron Works of this city, will be put on the San Francisco and San Pedro line, in place of the Los Angeles, which latter steamer goes in the northern coast trade. This new steamer is 240 feet in length, 33 feet breadth of beam, 18 feet depth of hold with a registered capacity of 1,445 tons. She will contain 45 staterooms, 35 of which will be on the deck and 10 in the saloon, and will have a speed of 15 knots per hour, and will be equipped with electric lights and electric bells. In finish, improvement, and for comfort and convenience she will not have a superior on the Pacific Coast.

THE *Tribune Independent* says that the steam traction engine destined for logging at the Empire mill arrived all right. The tests were successful. Considering that the engine was only guaranteed to haul 14 to 16 tons on a dead level, this test of hauling 18 tons up a grade of 1 1/2 inches to the rod, and the second test of hauling 12 tons up a 25-inch grade—which usually requires eight stout bores to do—was more than satisfactory. More than this, no such heavy grade exists where the engine is to work, and no more than eight tons at a load will be required. The load was four times the weight of the engine.

ON Pine ridge, Fresno county, Musick's mill is running and so is the old Donaboo now O'ken-don's, and the Bennett mill also. John Humphreys is putting in a new mill of large capacity about two miles beyond the Musick mill in a body of splendid timber, on what is known as the Reynolds' place. One feature of the lumber business this season, while entirely satisfactory to the millmen, is going to create a bad feeling among those who have been expecting to buy lumber at the mills and haul it direct to where they wish to use it, and that is, that nearly the entire out of the present season is

sold in advance, and the sawing will all be to order of the purchasers.

ETNA, Siskiyou Co., formerly called Rough and Ready, is situated at the base of Mount Etna, a mountain of 9000 feet elevation, and a peak in the great Salmon range, about midway and on the west side of Scott Valley, Siskiyou Co., Cal. Nestled beneath the shadow of this great mountain range, with the beautiful, rich fertile valley stretching out to the south, east and north, makes its site grand and picturesque. The town is noted for its water-power and milling facilities, there being formerly three grist mills and two sawmills besides other small factories. It is the base of supplies for the extensive Salmon River mining district, all the supplies being packed on mules from Etna into this mining region.

THE report of the Board of Survey on the Monongahela, now at the Mare Island Navy Yard, says: The general condition of the Monongahela is fair. She is very suitable for a store ship. An extension of the herb deck, as recommended, would add to her efficiency as well as strength. The board estimates the cost of labor and material to refit her for her present duty to be about \$45,150, or a little over 13 per cent of the estimated cost of a new ship of the same size and like material. The Bureau of Construction recommends that she be refitted in accordance with the recommendation of the board, and requests authority to proceed with the work at an early day, as any delay will increase the cost.

IN speaking of the Willow Brook shingle-mill the *Humboldt Standard* says: "The plant and buildings are all new, commodious and convenient. A 35 horse power engine moves the machinery. The shingle machine is the Perkins' patent; 60,000 shingles are made each day. The shingle saw makes 1900 revolutions per minute and the holt saw 1000. The mill was erected by John McAfee, who is now the engineer. Chas. Armstrong is general manager; Willard Wilson runs the holt saw; C. Perrott is joiner; packers, H. Mooney and L. Winstead. The last named will pack from 40,000 to 45,000 shingles per day and do it in splendid style. He is one of the most efficient men in this line in this State. Seven men are employed about the mill and five in the woods."

COL. WAKING has completed his plans for a system of sewage for San Louis Obispo, has placed his reports, maps, estimates, etc., in the hands of the city board of trustees, and now awaits the further action of the community. It can hardly be doubted that no error is possible in the plan so far as relates to the gathering of the sewerage in the city. It is comprehensive, taking in the whole town site, from Palm to Loyal streets, and from above the Ramona to the depot. It can be extended as necessity demands to sewer every dwelling in the city limits. It is not too extensive in its scope for present needs; but it involves no construction which will not be valuable and essential should the city grow to five times its present dimensions. Every part of the city is alike sewered, and is interested in having the entire system constructed.

THE San Diego iron and nail manufactory is located at Roseville, and the immense buildings to be occupied are nearing completion. These buildings will cover four acres of ground, and will be very substantial in character. Four hundred thousand feet of lumber was used in their construction, and it took 20 tons of corrugated iron for roofing. When in working order the factory will use 25 tons of iron and turn out 500 kegs of nails daily. One hundred men will be employed. The company has a capital of \$250,000. The officers are, president, N. H. Conklin; vice president and secretary, Col. W. J. Farrow; treasurer, Bryant Howard; general manager and superintendent, G. P. Clapp. Directors, E. W. Bushyhead, F. W. Putnam, E. W. Hendricks, J. A. Allison.

A LARGE force of laborers is now kept at work by the Contra Costa Water Company laying new pipes and mains in the many growing districts on the outskirts of Oakland. During the past week between 3000 and 4000 feet of two-inch pipe has been laid in the northern part of the city, in a district that but two years ago was only marked by an occasional house. Now, however, with the subdivision of the large tracts of land formerly held by individual owners—such tracts as Paradise Park, the Watt's tract, Harmon's and others—the increase in house building has been truly wonderful. Until recently these districts were without city water, the company not deeming it a profitable investment to lay pipes. So the newcomers were obliged to sink wells, many of them at considerable expense. There are instances where the wells, pumps, windmills, tanks and franchise have cost individual property owners as high as \$1000.

MR. J. B. PUGSLEY of St. Paul, who is now interested at North Yakima, says that in addition to the Griggs Lumber Co. and others reported in the *Takoma* papers, who will erect large mills on the sound, nearly all of the large lumbering firms along the upper Mississippi river anticipate putting up mills in Western Washington. The reason of this westward movement on the part of lumbermen are many, among which he names the fact that the lumber has been cut out of woods which are readily accessible in the Northwestern States, and that the timber there yields only about 20,000 to 40,000 feet to 40 acres, while in Western Washington the product is from 100,000 to 300,000 feet

to 40 acres, and that the price of logs on the stump in the East is from \$1 to \$3 per thousand, while out here it is from 50 cents to \$1 per thousand feet. The intention is to ship large quantities of lumber from Western Washington Territory to the markets of the East.

SOME of the numerous men from the East who have come to buy timber-land, feel a little nervous when they see the size of the Oregon trees. They have had no experience in handling such logs or in cutting them. They realize at a glance the vast difference between sawing up a log of tough fir five feet and a soft pine log two feet in diameter, and know that different modes of transportation and different machinery must be used here from what they have been accustomed to. They however, realize the value of our timber and the large amount of it on an acre. In regard to the lumber being brought to Denver from New Mexico and Texas, which has shut out our lumbermen from that market, one of these men says that millmen take portable saw-mills into the woods there and hire colored men for 80 cent per day, and the trees being comparatively small but tall and straight, make a good quality of lumber very cheaply. Before our lumbermen can compete with them they must have a very considerable reduction of freight rates.

THERE has been more than usual activity in the basalt block interests of Sonoma the past year. New quarries have been opened in order to meet the demand for basalt blocks to pave the streets of San Francisco, Stockton, and other large cities on the coast. Owing to the fine quality of the rock and the comparative light cost of shipment, and owing to the accessibility of Sonoma quarries to San Francisco, there is a constant and growing demand for blocks. This industry gives remunerative employment to a large number of men the year round, and is by no means a small source of revenue to the Sonoma Valley railroad, which carries the blocks to Dr. Schue Landing from whence they are shipped by schooner to San Francisco. From Jan. 1, 1887, to Jan. 1, 1888, there were shipped over the above railroad 22,458,180 pounds of paving blocks. Each block weighs between 20 and 27 pounds and the number of blocks shipped in 1887 amounted nearly to 1,150,000. The shipments from last January to date have aggregated 6,529,600 pounds. The magnitude of this business may be better understood when it is stated that the value of the blocks shipped in 1887 amounted in round figures to about \$84,000, and it took 1490 flat cars to transport the blocks to Sonoma Landing.

THE foundry and machine-shops of George G. Allen, Nevada city, Nevada county, has been in existence since 1855. The business of the foundry consists principally in the manufacture of steam-engines, hoisting and milling works, castings for quartz-mills, amalgamating pans, water-wheels, and other mine supplies. The works are capable of turning out the heaviest kinds of quartz-mill and machinery used around mines. The buildings are extensive and all the appliances are complete. The machine-shop proper is 80x40 feet in dimensions. In this department is a complete outfit of lathes, planes, drill-presses, bolt-cutters, etc., capable of doing the heaviest as well as the lightest kinds of work. At the present time there are but 12 men employed, but when the works are running to their full capacity, 35 find employment. At the present time the force is engaged in casting mortars for quartz batteries, after the Delhi style known as the Collins pattern, which are said by experts to be the finest yet made. A pump and boiler for Bloomfield are ready for shipping. A hundred 12 inch car-wheels for the Derby mine at Bloomfield are now finished. Four iron cars for the Maozonita are also ready to be shipped. Castings for the Rocky Glen, California, Washington, Blue Bell, Yuha and Delhi are being made. The foundry has frequent orders from the North Star and Empire mines of Grass valley. Work has been slack of late, but orders are now beginning to come in and things will soon be in full blast.

THE display of California goods at Melbourne will be better than was expected. The following is a complete list of exhibits to be sent, with the names of the exhibitors, from the Pacific Coast: From the San Francisco Produce Exchange, an elegant oaken cabinet containing samples of all cereals dealt in by the Exchange. Mining machinery from the following firms will be an important feature of the exhibit: Park & Looy, H. P. Gregory & Co., F. A. Huntington & Co., Pacific and Risdon Iron Works, Joshua Hendy Machine Company, E. G. Dennison, and San Francisco Novelty and Plating Company. Flour mill machinery from Joseph Wagner & Co., and the California Screen Company, together with agricultural implements from Baker, Hamilton & Co., will complete the mechanical display. The other exhibits will be of mixed paint from the California Paint Company; patent shades from E. H. Marwedel; leather goods from S. Blom & Co. and A. M. Kron & Co.; gloves from the Leak manufactory; ophology from C. M. Pum; wines from Alf. Greenbaum & Co. and Arpad Haraszthy & Co.; tulle life preservers from C. J. Hendry; salted fish from Lynde & Hough; honey from Schacht & Lemke; earth oils from Woodbury Oil Company; candies from Ehrenfort & Rothschild; doors from Sierra Lumber Company; wine casks from R. Armstrong; silk thread from Carlson, Currier & Co.; rope and cordage from Tubbs & Co.; cotton flour sacks from Neville & Co.; borax from the Pacific Borax and Salt Soda Company; laundry etarob

from J. Everding & Co.; sewer pipe and brick from Clarke & Son; consolidated soups from Consolidated Food Company; pianos from T. M. Antiehl & Co.; compressing machinery from W. S. Duncombe & Co.; butchers' supplies from California Casings Company; saddlery from Hart & Braodenstein; canned salmon from Dalafald, Morgan, Kissel & Co., and G. W. Home & Co. Geo. W. Meade & Co. will make a large display of dried fruits, and there will also be an extensive display of raisins from A. B. Butler of Fresno, and olive oil from Ellwood Cooper of Santa Barbara. California hops from Lillenthal & Co.; germea from Sperry & Co.; mustard from the Hudson Manufacturing Company; leather belting from A. D. Cook; canned meats from A. Man & Co.; and a large display of perfumery by the Western Perfumery Company, will complete this splendid array of California's products.

STOCKTON is shortly to have a new manufacturing industry, and one which will give employment to a large number of men. The Stockton Combined Harvester Works, of which corporation Mayor Shippee is at the head, is going into the business of manufacturing railway cars. Mayor Shippee was interviewed upon the subject, and said it was true that the corporation had decided to engage in that business, in conjunction with the manufacture of agricultural machinery. In fact, they were at work now making the necessary additions and modifications in their already large establishment. He went on to say that the association had every facility for the business. With few exceptions the machinery necessary for the construction of railway cars was the same as that used in the manufacture of harvesting machinery. The only thing they would have to get was a large power press. Mr. Shippee said the company had on hand a large quantity of lumber which had been seasoned for two years, and which was just the material for cars. He thought that everything would be in readiness to commence operations by the 5th of next month. Mr. Shippee said that it was the intention to manufacture all kinds of railway cars, both passenger and freight, also street cars and cars for motor roads. He predicted that before a year had elapsed the new industry would be the means of giving employment to three hundred men. They already have a contract with the Southern Pacific Co. to build 100 cars.

Good brick clay is found in this vicinity, mainly on the bay shore in Marin county, between Point Tiburon and San Rafael, and in Contra Costa county between Point Isabel and Point Pedro. The deposits on the Marin county shore are about worked out, but on the Contra Costa side there are several in operation. New deposits of brick clay have been found in the hills back of Fruitvale, Alameda county, and a successful industry is promised there. Brick can be made on the ground and shipped to Oakland by the new Alameda County Railway, and thence by schooner to this city at a very low freight rate. The deposit is a large one and it is said to contain some of the finest clay yet discovered in this State. In view of the fact that our contractors and builders have been loud in their complaints of the poor quality of brick supplied to them recently, it will be a source of satisfaction to be able to get good brick from a readily accessible point. The discovery of the deposit was made by the working force on the Alameda County Railway. J. H. Woodward, who is president of the company, says that steps will at once be taken to develop the deposit and start a brickyard on the ground. He thinks that the discovery is a valuable one, and that the industry will prove very profitable. The deposit is on the Laundry Farm in the vicinity of the Mills Seminary. If the demand for good brick continues at the present rate the owners of the deposit will feel justified in erecting works from which they can turn out from six to ten carloads a day.

THE result of the experiment of illuminating the Crown Mills at Stockton, San Joaquin Co., with natural gas has proved entirely satisfactory to the manager, Mr. Welsh. The interior of the building is illuminated by means of 36 powerful incandescent lamps of the latest improved pattern, situated in different departments of the mill. The flame is much brighter and steadier than that produced by manufactured gas. The lights burn without the slightest flickering. The grinding department, containing 40 double sets of rollers and seven run of stone, which requires plenty of light, is supplied with six lights. The packing, bolting and purifying departments, on the third, fourth and fifth floors, are each supplied with three lamps, which furnish all the light necessary to carry on the work of each department. The well from which the supply of gas is obtained is located on the north side of the mill close to the building. The work of boring it was commenced last August, and at a depth of 1000 feet below the surface the present supply of gas was struck. The depth of the well is now 1330 feet and the cost of its construction about \$2500. The total cost of introducing the natural gas to the mill and utilizing it for illuminating purposes will not exceed \$3000. Mr. Welsh explained that the gas that was left over after illuminating the building was run under the hoilers and used as fuel. The company, at the lowest calculation, makes a saving of \$150 a month in fuel, in addition to \$100 a month that has heretofore been expended for manufactured gas for illuminating purposes.

STURTEVANT MILL.

This Mill as a Crusher and Pulverizer is without rival. Is in operation in each of the following smelting works and mills.

**JAMES LEFFEL'S
Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Sectional View of Pulverizer.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russian iron in Quartz Screens. Planished iron screens at nearly half my former rates. I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot-Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, CAL.
JOHN W. QUICK, Proprietor.

THE PELTON WATER WHEEL

Gives the highest efficiency of any wheel in the world and is everywhere recognized as the standard for high pressure service.

UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other wheel in the country. It is not only most economical of water, but the most ample and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRICAL TRANSMISSION.

Power from these wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Trams, cars, etc. Address

The Pelton Water Wheel Co.,
127 FIRST ST., SAN FRANCISCO, CAL.

QUARTZ SCREENS

A specialty. Round, slot or burred slot holes. Genuine Russian Iron, Homogeneous Steel, Cast Steel or American planished iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

INVENTORS, TAKE NOTICE!

DEANE STEAM PUMP.

THE RAND DRILL COMPANY.

23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 270 Market St., S. F.

FOR WEEK ENDING JUNE 26, 1888.

385,045.—SHOE TONGUE FASTENING—C. F. Crowell, Portland, Ogn.

385,101.—CAR COUPLING—W. M. Cutter, Marysville, Cal.

384,973.—CAN-OPENER, ETC.—E. Hawes, Sacramento, Cal.

385,314.—STATION INDICATOR—Benj. W. Lyon, S. F.

384,996.—TIME BALL—Chas. Muller, S. F.

385,133.—RIVET BURR REMOVER—E. H. Perkins, Visalia, Cal.

THREE TRADE MARKS—H. S. Crocker & Co. S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STATION INDICATOR.—Benj. W. Lyon, S. F. No. 385,314, Dated June 26, 1888. This is one of that class of station indicators in which a ribbon bearing the names of the streets or stations is caused to travel periodically by means of power derived from contact of suitable mechanism with logs or obstructions in the road-bed; and the invention consists in a novel automatically operating pneumatic mechanism by which the power is transmitted to the indicator, and in a novel arrangement of the ribbon-driving mechanism within the box or casing. The object of the invention is to provide a simple and effective station indicator and advertising medium to be used upon steam and street cars and in other suitable places.

RIVET-BURR REMOVER.—Elijah H. Perkins, Visalia. No. 385,133, Dated June 26, 1888. The object of this implement is to remove the burrs of rivets so the rivets may be taken out. The invention consists in a hit having on its lower end cutters, said bit being mounted and adapted to rotate within a casing or stock, the lower end of which is provided with teeth for holding the stock stationary around the rivet hurr while the cutter within operates upon the hurr and cuts off the swaged portion of the rivet.

CAR COUPLING.—Wm. M. Cutter, Marysville. No. 385,101, Dated June 26, 1888. This device for automatically coupling cars consists in the combination with the car-humper and draw-head of a pin-holder and means for releasing the same at the instant when the cars come together, so as to allow the pin to drop into its proper position through the link of the car-coupler.

Mining Share Market.

Owing to the national holiday coming on Wednesday this year, the Stock Exchange adjourned from Saturday, June 30th to July 5th. Therefore no business of any moment has been done in mining stocks. Up on the Comstock the mine are yielding bullion in larger quantities than they have for years. The water is rather low in the Carson river. How it will hold out is a question. From all reports there is still much snow in the Sierras.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Moulton, June 27, \$14,000; Mt. Diablo, 30, \$8269; Cons. California and Virginia, 30, \$104,601; Confidence, 30, \$17,897; Savage, 30, \$26,350; Hale and Norcross, 30, \$140,000; Hanauer, 26, \$1900; Germania, 27, \$1479; Hanauer, 27, \$1380; Germania, 28, \$1360; Hanauer, 28, \$4500; Germania, 29, \$1488; Hanauer, 29, \$2100.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Mr. J. S. Ewen, 123 California street, is the Pacific Coast agent of the American Railway Publishing Co., of New York and Chicago, and has furnished us with copies of the Street Railway Journal. He will be glad to receive any items of interest concerning railway matters, such as matter relating to novel appliances, extensions, new roads, etc. In connection with the papers he represents, Mr. Ewen has opened a purchasing agency for the convenience of interior patrons.

Mining Bureau Statistics.

Recent contributions to the museum of the California State Mining Bureau are as follows:

Silver ore, with native silver, Rialito Chihuahua, Mexico, from E. E. Cunningham.

Seateite, five polished specimens of various colors, Oposura, Sonora, Mexico, J. H. Crossman.

Gold on garnet and on epidote, Oaxaca mine, Idaho, J. C. Neslon.

Building stone, handsome carved column of seape "brownstone," from the Los Angeles Granite and Brownstone Co.

Gold quartz, rich in free gold and telluride of gold, Coos county, Or., A. H. Moore.

Gold in iron Jasper, Tuolumne Co., T. F. McArdle.

Petzite (telluride of gold), Sonora, Tuolumne Co., J. Z. Davis.

Gold quartz from the Calumet group of mines (six), Shasta Co., Almarin B. Paul.

Gold crystals on rhyacolite, Summitville, Colorado, J. B. Farish.

Telluride of gold, Boulder Co., Colorado, J. B. Farish.

Graphite in six-sided crystals, Colfax Co., New Mexico, J. B. Farish.

Gold on slickensides, Keystone mine, Amador Co., Cal., from the company.

Gold quartz, Arrow-weed District, San Bernardino Co., Cal., E. Wollch.

Silver ores from the Waterloo mine, Calaveras, Cal.

Section of iron water-pipe, completely filled with crystallized cinnabar, from the Sulphur Bank quicksilver mine, Lake Co., Cal., Melville Atwood.

Eighteen specimens of minerals from the Eastern States.

Gold and Silver ore, Mexico, E. Wollch.

Aragonite (onyx marbl.), Siskiyou Co., C. J. Smith.

Granite from new quarry at Mt. Raymond, Fresno Co. (said to be the best so far found in California), McLeellan & Co., and many others.

San Francisco Metal Market.

Dewey & Co.'s Scientific Press: Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration of a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are utterly nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

THE MONTANA COMPANY (Limited).

Room 7, No. 109 California Street, SAN FRANCISCO, CAL.**

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built so compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds,
has a capacity equal to 30 stamps, reducing
two and a half to three tons per hour
of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties hav-
ing Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with
record of several years. No gridding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

**THE
DOUBLE "ECONOMIC" STAMP MILL.**

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp
is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the ra-
pidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so
that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in
any other mill to do the same amount of work.

The Mortar has screes at both ends, giving ample discharge. There are no cams or tap-
pets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a
mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE
LARGEST CAPACITY.

TATUM & BOWEN,

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers
cordially invite miners to critically
examine and pass judgment upon
this improved system of milling
and amalgamating ores in the fol-
lowing particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mills is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machines in use.
8. In its simplicity of construction.

We challenge competition with
Stamps, Ball Pulverizers or
other ore crushing machines now
before the public.

Send for Circulars and Price List.

Number 2.

Deep-Creek and River-Bed Mining.

There are in this State and elsewhere many deposits of auriferous gravel in deep creeks and river-beds. Though known to be rich, they were too deep and wet to be worked in the early days of California mining, and in many instances they are now covered up deeper by the gulches, ravines and creeks having been worked out and the debris dumped in and on the beds of the large streams. The miners often knew them to be richer than many small streams which they were working, but the extra labor of deep "stripping" by hand-work was against them and there was more profit in working shallower though poorer diggings, less capital also being required.

Some years since J. P. Lamhing, a man who had conducted mining operations for the past 36 years in almost every way that gold is mined, turned his attention to this subject. Knowing of the existence of extensive and rich but deep deposits of gravel in creek and river-beds, he started in to devise suitable steam machinery to enable him to handle the earth or "strippings" overlying the pay gravel more economically and expeditiously than by the old method in practice in ordinary placer mining. It was also necessary to handle the large flow of seepage water usually met with in deep river-beds. After expending a large amount of labor and money experimenting for some five years, he has now at work the most complete plant to be found in the country.

The mine is called the Arroyo Seco, and is in Amador county, in this State. The machinery was made by Knight & Co. of Sutter Creek. It may be stated, by the way, that the system may be applied in some places where hydraulic mining is not allowed, enabling the miner to hoist his debris away from the tail of the flume, swing it away 220 feet, and pile it up, allowing the water only to pass down the stream.

Mr. Lamhing uses two large steam derricks for stripping off the deep deposit of barren surface sand, gravel and loam. These derricks are shown in the engraving. The derrick car is 56 feet long, 16 feet wide and 18 feet high. It is strongly built, covered with corrugated iron and weighs about 75 tons with the engines, boilers and machinery. The mast at the front end is 56 feet high, and boom 110 feet long, the outer end elevated 56 feet above the ground.

There is a self-filling bucket or dredger attached to a steel-wire rope (as will be seen by cut) at one end, the other passing up over a shear in the end of the boom and thence down on the topside of the boom to the machinery in

the derrick car. One man stands in the lever-house, near the top of the mast, 50 feet above ground, where he has a full view of everything around, and by the use of levers, with suitable attachments to the machinery below, he has perfect control, and handles all the machinery with ease and accuracy. The out shows one bucket on each derrick, one open and the other shut. The buckets are opened and closed by steam or compressed air. The power exerted in closing is 31,000 pounds, if necessary, in hard ground. When the bucket is opened and on the ground, the man in the lever-house, near the top of the mast, turns on steam or air to

and each succeeding pit is so dumped. The sluices are usually two to four strings, being set on the pay gravel in the pit, on the proper grade, and the necessary water brought from the surface to do the washing. After passing through the sluices, it passes with the seepage water through culverts underground to the pump-house, 200 to 400 yards distant, where it is raised to the surface 36 feet high by powerful centrifugal pumps, built especially for handling very muddy water and even sand and gravel. The water, or so much of it as may be required, is then returned to the sluices, where it is again used for washing. This, however, is

What is a Mine?

As defined by the lexicographer and the scientist, a mine is a subterranean work or excavation which has for its object the discovery and extraction of metallic ores or other mineral substance. But in addition to the underground works which constitute the mine proper, the term in its general acceptation includes also the ground itself, together with the plant, whatever the kind, such as hoisting, pumping, and reduction works; buildings for the accommodation of workmen, coal-hunkers, etc. According to this definition a simple

mineral claim or location on which no deep or underground work has been done would not constitute a mine, notwithstanding the custom that obtains to the contrary. Throughout our mineral regions every such claim, even though no work has been done upon it, is called a mine.

Even in common usage it seems to us that the distinction above taken ought to be observed, since to designate a wholly undeveloped mineral lode or other deposit a mine is to misrepresent and mislead. Such claim is wanting in the first and most essential feature of a mine, the underground work prosecuted for the discovery and extraction of ore or other mineral product. We might with as much propriety call a pre-emption or a homestead claim a farm as to call such a mineral claim a mine. It was shown in

MINING DREDGERS AT THE ARROYO SECO MINE, NEAR IONE, AMADOR COUNTY, CAL.

close it, and hoists it up. He then swings it around to any place within a circle of 220 feet, drops the load of from $1\frac{1}{2}$ to 2 cubic yards, swings the bucket back, lets it down on the ground open, all in from one to two minutes, according to distance to be moved. The derricks are capable of hoisting a load of 10 tons 50 feet high. They are placed on a solidly built railway track, which is taken up in front and moved to the rear as the excavating progresses.

Three men are required to operate one derrick—one leverman, one fireman and one track-layer. After excavating to the depth of 27 to 30 feet at the Arroyo Seco mine, they reach the pay gravel. It is from four to nine feet deep, the surface of it paying a few cents per pan, and getting richer as they go toward bedrock, where it often pays as many dollars per pan. When they first open the mine in the spring, if the pits or excavations have been filled up by the winter floods, they strip off a pit say 60 to 80 feet square, and hoist the pay gravel out on the surface, where they wash it in sluices while the stripping goes on. The next pit so uncovered is washed in the pit and dumped where the first pit was worked out,

only done when water is scarce, which happened last fall. But a small stream of water is necessary when handled in this way, the heavy sediment settling, while passing to the pump-house and returning to the sluices again. Mr. J. P. Lamhing, the superintendent of the Arroyo Seco Mining Co., who furnishes us the above information concerning the process described, has had many inquiries about the system of working adopted, and this description will interest many miners who have ground of a similar character.

A SUIT has been begun against the North Bloomfield Gravel Mining Company, asking that defendant be enjoined from dumping debris into the Yuba river, and also from selling water for mining purposes. The action was instituted by the United States, represented by Attorney-General Hart. This is the first time a suit has been brought in this way.

THE Oregon Iron and Steel Co. at Oswego has 300 men at work. The new furnaces will be ready for use by August. New hunkers for ore are being built. The company will work on a larger scale than ever before.

these columns not long since that as many as 30,000 mining claims had, first and last, been taken up and recorded in the State of Nevada, with presumably six or eight times as many in the other Pacific States and Territories—say 250,000 all told. Under the usage that prevails, all of these claims, or at least as many of them as have been kept good, are spoken of as mines, which not even five per cent of them really are.

This loose sort of phraseology came into vogue during the earlier stages of mining in California, when digging up the auriferous gravel with a pick and washing it in a rocker was termed mining, though hardly more like the real business than digging and housing potatoes. Gradually, as deep pits were opened on the river bars, and shafts were put down and tunnels run for reaching the drift or opening up the vein deposits, the business began to take on the proportions and otherwise assume the characteristics of substantial mining.

Now that this industry has so changed, we should begin to speak of it with a little more discrimination as well as show better judgment in our classification of what belongs to it than we have been accustomed to do.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Dutch Flat and Vicinity.

EDITORS PRESS:—Perhaps it is safe to conclude that not one person out of a thousand of the present population of California has ever heard of the circumstances from which Dutch Flat took its name. Since my arrival a few days ago I have been regaled with numerous stories relating to the matter. They have varied so much that I am certain that all of them cannot be quite correct, so I am left to decide for myself which is most entitled to credence. Stripping the subject of all the romance with which it has been connected, I find that in the early fifties, an adventurous Dutchman, in search of gold, after wandering among the rugged canyons, spied a little flat, now the site of the town, and, Dutchman-like, squatted upon it and began to mine near by. The miners of other camps in the neighborhood at first referred to this digging as the flat where the Dutchman lived. In those busy times the miners were not long in hitting upon an apt abbreviation of titles, and, accordingly, this camp which so suddenly sprang up, was soon known as Dutch Flat.

The population of the town, once numbering thousands of busy, prosperous miners, has been reduced within the last few years to between 700 and 800 all told. The disastrous termination of the debris question, which a few years ago caused the operation of hydraulic mining to cease, has worked a great hardship upon the poor miner. Very many, whose fortunes seemed assured, if not already within their grasp, found themselves, on the enforcement of the Anti-Debris Act not only "broke," but thousands of dollars worse than nothing. They had invested their all, and more, in the machinery and appliances necessary for the prosecution of their legitimate enterprise, which finally they were not allowed to continue. All they now possess is the empty satisfaction of knowing that within the soil they possess, granted them for mining purposes, there are thousands, and perhaps millions of dollars, which they dare not use profitable means to make available. Tell me, is it not a little hard to say that such a state of affairs is even-handed justice? While a full measure of sympathy is claimed for the hard-working and honest granger, it would seem highly fitting that at least a mite should be loaned to the poor but equally honest miner.

The country for miles and miles around Dutch Flat is strewn with the piping, once used in hydraulic, which is being gathered at the railroad depot to be shipped to the mining regions of Oregon, where thus far no kicking against the "slicens" is going on. The web-footer, unlike the tar head, seems to have enough to engage his attention without meddling in the affairs of his neighbors.

It will not do, however, to take too gloomy a view of the outlook for the mining interests of this region. There is ground for hope that mines of untold wealth will sooner or later be discovered in the vicinity, from the fact that at no time within the history of this part of the country has there been more skillful attention paid by a greater number of men to prospecting for quartz exclusively, nor have the labors of the prospector been devoid of encouragements. Reports from various directions are of a character to cheer up the drooping spirits of the inhabitants of this region. Near Gold Run, but a few miles west of here, the Everhart Bros. have discovered an eight-inch ledge, which tested, lowest ore, \$152; highest, \$300. It is situated in the secret town mining district. The test was made of rock at the depth of 74 feet, where the ledge was lost. They are now trying to get on the ledge with pay shaft. The main tunnel is now 490 feet. These same gentlemen lately sold Mr. J. A. Parker of Sacramento a ledge for \$900, which the latter is exploring. Eighty-five feet descent has been made already and prospects as well on the surface. This ledge averages 2½ feet.

It is hard for those who have long followed gold mining and become infatuated with the pursuit to give it up. It is next to impossible for the miner to see any satisfactory reward in but few other callings. Were this not the case much of his grievance, so far as this section is concerned, would, in due time, vanish. By actual experiment it has been made clear that for the production of some varieties of fruit, no section of famous California can excel this. The difficulty, so far, seems to be to get general interest on the subject duly awakened. To the credit of such men as Messrs. H. A. Frost, J. C. Chester, Chas. E. Kidd, Kinney and a few others I might name, who are directing scientific attention to the matter, and who have each offering promise in fruit production, it is no longer a question of producing the finest apples, pears and plums grown in the State, and perhaps unequalled anywhere in the United States. Some of these gentlemen can show last year's apples to-day apparently as sound and well preserved as on the first day of this year. The altitude and consequent temperature seems specially suited to the production of the varieties I have named. That this branch of industry must soon become prominent, if not paramount to every other, requires no great sagacity to foresee.

Then again there is wealth in the climate of this region, and the appreciation of it will increase as the knowledge of its excellence spreads out and reaches our less favored brethren of the Eastern States. When the senseless craze concerning Southern California climate shall have died out, as we have abundant reason to believe that it will shortly, and people become aware of the fact that California is not in Los Angeles, but simply the reverse, then, beyond doubt, the middle and northern sections of the State will receive their due share of attention, and the western foothills of the Sierras will be sought out and appreciated. And there is comfort in the assurance that this boom, which shall sweep over this portion, will not collapse with the season, but will be solid and enduring.

As regards the healthfulness of this region but little need be said. All know, or, at least, should know that mountain life and healthfulness are well nigh inseparably connected, especially in so far as reference is made to submountains as these. Numbers are beginning to find out that this is one of the places to come to pass a really pleasant spell. Reasonable hotel accommodations are furnished at Gold Run, where B. Moody of the National Hotel pays strict attention to his line of business. While at this place W. A. Sharon of the Dutch Flat house not only makes an effort to please his guests, but succeeds so well that guests are loth to depart. This gentleman takes an especial interest in making known the various attractions which the region possesses for tourist and others who lay over here. On my arrival Mr. Sharon alluded to some of the claims of this neighborhood upon the public as a resort. I told him that I was not aware that anything of special importance existed here to interest travellers. "That is just the reason why I mention it to you," he said, "comparatively few, if any, strangers are aware of what grand scenery is here; one view in particular that is to be seen within four miles of this place. I will take you to it to-morrow if you wish. It is off the line of the railroad is one reason, I suppose, that so few know of it." I assured him that it would be a means of much gratification to me to behold such a view as he gave me to understand it to be.

So on the following morning, after breakfast, we were not long in making ready for the trip. The team being in readiness, we soon mounted and found ourselves whirling along at a rapid speed behind spanking steeds part way over the old stage road and part way along the old emigrant grade, but for the most part along a road, if road it might be called, that had long been abandoned, and was now obstructed with caved banks and fallen trees; but withal it was a pleasant ride, which brought us to one of the highest eminences overlooking the American river that exists in the neighborhood. Alighting from our buggy and tying the horses in the shade of a pine tree, my escort led the way a few rods beyond, when suddenly there broke upon our vision a chasm of over 3000 feet in depth. The rock upon which we stood overhung almost perpendicular walls of granite. Through the bottom of perhaps 1000 acres flowed a stream apparently about 10 feet wide, but which I was assured was at least sixty. This proved to be the American river and the spot is known as Green Valley. At the edge of the river Mr. Sharon pointed out an upright stone which is called Pyramid Rock, 100 feet high, but from our position it had the appearance of less than ten. Miners' cabins, of which there are a number, were seemingly mere bird-nests, and adults presented the diminutive stature of infants. Looking to the eastward, Old Man Mountain, a prominent snow-capped peak of the Sierras, loomed skyward, while to the south and southwest Indiana Hill, Iowa Hill, Forest Hill and other old mining camps of lesser note were pointed out to my admiring gaze.

A little farther to my right in dimmer distance I could behold the great Sacramento valley spread out and presenting in the glimmering sunbeams the appearance of a vast inland sea. For more than an hour I was an attentive listener to a narrative of the scenes and experiences of early mining days, as given by one who had participated in person. "Do you see that rattle in the stream just below Pyramid Rock?" said Mr. Sharon. "That is where Waterloo claim was located. It was not thought to be valuable at one time and was sold to Chinamen for \$400. Within three months they cleaned up \$125,000 from it. A short distance above, where you see that cluster of cabins, is Hidden Hill. At this place was located the famous Golden Ring claim. It was among the richest claims of the American river diggings. I would not venture to say how many millions of dollars were taken out of it." My companion then related the Indian legend connected with the rock on which we were sitting. As the story runs, it appears that in the long, long ago, before the intrusion of the paleface, there dwelt in Green Valley a tribe of natives to which belonged a certain Indian maiden whom the chief's son longed as his wife. But the damsel would otherwise. An imperative injunction was finally issued by those in authority over her to the effect that she must yield to the ardent wish of her royal lover. Finding entreaty on her part unavailing, one evening, as the sun was hiding his face behind the lofty mountain-tops, this courageous daughter of the woods climbed to this point and cast herself down the precipice. From this circumstance it is since aptly termed by the whites, "Lovers' Leap." F. B. L.

Dams for Mining Debris.

The Operations at North Bloomfield.

EDITORS PRESS:—Silt has been commenced by the U. S. against the North Bloomfield Gravel Mine. The injunction of this mine as an open hydraulic some five years ago, is an old story, but for some time past operations have been carried on under great disadvantages on the plan of impounding the debris. Of course the work has been very much crippled under this limitation, but the company has managed to do a profitable business. Now it seems that even this resource must be cut off, and the once famous mine will be added to the long list of non-producers.

I have just visited this mine. The manner of working, as many of your readers know, is to elevate the tailings from the monitors to a height of 90 feet, by means of the hydraulic elevator. They use 675 inches of water under a pressure of from 350 to 530 feet for piping, and 1400 inches under 530 feet in the elevator. All of this water and all of the tailings pass to a reservoir 2500 feet long, formed by a dam across a portion of the worked out hydraulic ground. The dam is 20 feet thick, stands at an angle of about 66 degrees, and is made of small pine trees laid across its length, and gravel.

The present height of the dam is 40 feet, but it was not built to this height in the first place, but gradually, as required. This is a feature of debris dams which seems to have escaped the attention of some, including the judges of Supreme Courts, who have expressed opinions as to the feasibility of impounding tailings on a large scale. A debris dam need never be exposed to a very considerable pressure of water, being built only to a very moderate height at first, and gradually raised as the bottom under the water is raised by accumulation of the impounded material. In this particular case the dam is absolutely safe because it is at the upstream end of the reservoir, and the inlet is so near to it, or at least one inlet is, that the coarse gravel, not the slickens, is that which remains banked against it, and in fact, at this writing, there is a strip of dry, solid land, 100 feet wide, adjoining and forming a part of the dam. The angle of stability of such material is not greatly less than the slope of the dam, and the gravel soon becomes in a measure cemented by the infiltration of sand and ferruginous water. No large stream of water can ever flow from the reservoir over this dam to cut it, because the flow is the other way, and if the brush of which the dam is made (pine trees) should rot in course of time, and it would scarcely do so during the life of the mine, the gravel would by that time have acquired, if it does not now possess, stability independent of the dam. And if the dam could break to-morrow, and all the contents of the vast reservoir could run out, which they could not, the only result would be that the mine would be to that extent refilled by its original material.

The present outlet of the reservoir, through which flows the dirty water and a little suspended slickens, is at a point about 1500 feet distant from the inlet and from the dam. This outlet consists of a cribbed and planked shaft connecting with the mouth of the old drain or tailings tunnel of the mine, which tunnel, by the way, cost the company half a million dollars. This shaft is built up *pari passu* with the dam, in proportion as the reservoir fills with debris, and so as to maintain such a depth of water constantly as to insure the settling of all but a small percentage of solid matter.

A new outlet 2300 feet from the inlet is now in process of construction by means of an inclined tunnel or drift on an angle of 20 degrees to connect with the drain tunnel. This drift will be 615 feet long, of which about 100 feet is now completed. At the mouth of the drift another box-shaft will be built up as required to retain the tailings. The drain tunnel delivers the muddy water into the South Yuba river.

Whether it is that the water escaping from this reservoir still carries suspended a sufficient quantity of silt to be appreciable injurious to the rivers and valleys, or whether it is that the company is in contempt of court by working in any way, I do not know. The case seems a hard one, and it is just such cases as this that are taking the breath and the courage from the miners, many of whom are convinced that even drift mining is doomed and quartz will sooner or later come under the ban; and why not? The same string runs through all, and that string sounds ever the same note, varying only the octave.

I have read the article of your correspondent, L, who has taken the word out of my mouth, and your editorial remarks on judicial decisions, in regard to which I plead guilty of being "in contempt" too profound for utterance, or at least for printing. I know of a case near Colfax, an injunction by a supreme (God save the mark) judge, whose charge to a jury some years ago moved my deep disrespect. It is not that I have any direct personal interest in mines. I should not care if every mine in California were closed to-morrow, on my own account; and I concede, and the miners with whom I have conversed concede, that the rights of the farmers and other valley dwellers should be considered; but I have no patience with the judicial stupidity which cannot see the difference between a debris dam and a water dam, and which permits the latter, which is dangerous in spite of all precaution, while prohibiting the former, which,

with ordinary prudence is absolutely safe. I fancy that perhaps the judge may have lost money in mines in the past.

These considerations, including those presented by yourselves, and some others, recall the often asked but seldom answered question, "what are we coming to?" And I fancy the answer to be, to unbearable tyranny of officials and monopolists first, and to disruption of this great commonwealth, or to imperialism at last. Americans boast of their country as the land of freedom, *par excellence*, but California is not near so free as any one of the Australian colonies, less would the Chinese question have been settled long ago, and this debris matter would, as it could, be arranged speedily and justly.

C. H. AARON.
North Bloomfield, Nev. Co., July, 1888.

Ores for Leaching in Mexico.

EDITORS PRESS:—Having read the interesting articles of C. A. Schenk on the leaching process, published some months since in your valuable paper. I asked him lately if he knew parties that would take a controlling interest in large deposits of crushed ore fit for lixiviation, and he refers me to you as in a position probably to bring me in contact with moneyed men, who might be interested in this subject. Thus, I beg leave to trouble you in a matter which may interest some of your friends. The facts are simply these: From a bonanza lasting over 45 years and producing weekly 2500 tons of ore, crushed hastily and run through the patio as quick as possible, there is a vast amount of tailings, and these tailings assay about 8 to 10 ounces per ton. I would say the actual test runs yielded 12 ounces per ton of silver and some little gold. The location is near a town of 7000 inhabitants, three miles from a Mexican Central R. R. station, in a cool climate excellent for health; by cold, I mean tableland, with fresh temperature and practically no winter. Coal will there now soon be delivered at \$10 a ton, while fuel is a little more expensive, and salt costs \$7 a ton. For 20,000 tons of selected ore of 10 to 12 ounces, one-third interest is retained and a royalty of \$2 per ton has to be paid. In exchange, a hacienda is offered with water supply for use of the new plant, which would be paid by the surplus value of this ore and more, because half the quantity of ore would be sufficient for it. After amortization of all expense the controlling interest of a little over half would be to the owners of the plant and hacienda, and thus a running or continuous profit without expense secured.

I know of quite considerable deposits of ore fit for leaching and claimed to run 50 ounces per ton, but some distance off the railroad, though in a part where wood and timber is very cheap, and all quiet and safe. The examination of both these ores on the ground is so easy, and test runs could be so cheaply made, that the calculation of profits to be secured should be reliable.

For amalgamation I control 75,000 tons of rather free-milling ore, which leaves \$8 per ton for treatment, while the same ore tested at Luckhardt's in San Francisco has been calculated to cost from \$1.15 to \$1.20 per ton. Even supposing fuel double in price here, yet profits would be considerable and only a "Boss" plant wanted. A 40-stamp mill is idle here, for which I could get all the ore it could treat at good profits.

GUANAJUATO, MEXICO.

Tin Plate Manufacture.

EDITORS PRESS:—A local journal has copy of an article recently published by you recounting operations which have been taken in connection with the working and development of tin mines in your State, also stating that tin plate had been satisfactorily produced with tin made from the output of these mines; and, further, that it was contemplated to proceed with this industry for the supply of tin plate to the western portion of the continent.

I have not a knowledge of any of the parties interested in the movement, and would therefore ask the favor of your inserting this letter in your journal, so that in attracting their attention it may possibly lead to opening up the subject of tin plate manufacture with myself. Meanwhile let me state that I am a practical tin-plate maker from South Wales, England, now engaged in this country in advocating its manufacture, and know my contributions to the Eastern press are known and recognized as an authority upon the subject.

I am interested in patented appliances in general use at tin-plate works for reducing cost of production, and am therefore in the most favorable position to undertake the making of tin plate under the most advantageous conditions. Trusting this letter may elicit a reply from those connected with the movement, I am yours faithfully.

Passing Events.

The Cracker Creek mines, in Oregon, are just now attracting great attention. Some heavy sales have been made. The new mining town of Cleveland is at the junction of Silver and Cracker creek, and prospectors are arriving there from all directions.

The first dividend of the North Star Co., Grass Valley, Nevada county, this State, is announced. It amounts to \$50,000. This mine is taking out ore from the depth of 1600 feet on the incline, and the famous Idaho, which has been a regular dividend-payer for 19 years, is getting its ore at a depth as low as 2200 feet. This looks well for gold ore as "going down."

At last, after patient waiting, the Black Hill people, Dakota, are to have their leaching works, the brick and lumber for the plant having been purchased. Exhaustive experiments have already been made with the ores, and the leaching process decided on as the best by which to work them.

It is not probable that Stewart's Mining bill will be acted on by Congress this session, and miners can go on as usual without change of law for the present.

The quartz-mining industry in this State was

never in a more prosperous condition. Reports received indicate increasing interest in this branch of mining in California.

The silver-mining craze in Australia brought on a mining-stock speculative boom which the PRESS predicted would have a bad result. Late news from there states that many Australian investors have been financially ruined.

Drift Mining.

This business, pursued in California from an early day, continues one of the most active and profitable branches of gold mining in the State. Though confined mostly to the central mining counties, gold extraction by the drift method is carried on over a wide area, the Pliocene channels or "Dead rivers" constituting the sites of its most extensive operations. For reaching the deposits deeply buried in these old riverbeds, recourse is had to shafts and tunnels, from which the work of their further exploitation is carried on. When shafts are employed for the above purpose, the auriferous gravel is raised to the surface in large buckets operated usually by windlass or horse-power. Where tunnels are in use the material is brought out on cars run over tramways.

The following constitute the most notable drift localities in California: Vicinity of Forest City and Slate Creek, Sierra county, where some of the tunnels driven exceed a mile in length; along Little and Big Butte creeks and about Magalia, Butte county, most of the mines along these creeks being small but very productive. At Magalia also a few of the claims paid enormously. Of all the drift districts in the State the mines on the Forest Hill divide, Placer county, have yielded the most steadily and in the aggregate perhaps the most largely. The closing of the hydraulic mines has tended to late to give additional importance to drift mining by diverting to the latter much of the capital and labor formerly employed in hydraulic operations.

The Stewart Mining Bill.

As before stated in the PRESS, there is little probability of the amendments to the mining laws proposed by Senator Stewart of Nevada passing Congress this session. As, however, the amendments provide that the period within which annual work must be commenced on the 1st day of August instead of the 1st day of January, as heretofore, many miners have been anxious to learn the fate of the bill. We wrote some time since to Senator Stewart for the exact status of his bill, and this week received the following letter:

UNITED STATES SENATE,

WASHINGTON, June 30, 1888.

Editor "Mining and Scientific Press"—DEAR SIR:—On my return from Chicago I found your favor of the 8th inst. Inclosed I send you a copy of the mining bill introduced by me as it passed the Senate. It is still pending in the House Committee on Mines and Mining. I do not know what action the committee proposes to take on it during the present session. It may be amended in some particulars. I have received many letters from mining men suggesting amendments to the bill, and I may submit some of them to the House Committee. A suggestion in a letter I have just received from Eureka, Nevada, seems worthy of consideration. It is to the following effect: If the same person, corporation or association own several claims which combined do not exceed 1500 feet in length by 600 feet in width, the owner may make a relocation of the same and obtain a patent therefor in one application, provided adverse rights are not affected thereby.

I have not pressed the bill in any haste; there is no difficulty in passing it when perfected. My anxiety has been, and still is, to have the bill when passed remedy the defects which have been discovered by experience under existing laws. Any suggestions, therefore, in regard to the bill are very welcome. Yours truly,

WM. M. STEWART.

Lack of space prevents our printing the bill in full in this issue, but we will publish it in the next number of the PRESS.

The Consolidated California and Virginia mine on the Comstock produced \$405,834.08 in June from 13,030 tons of ore. The gold contained in this bullion was valued at \$197,935.29 and the silver at \$207,898.79, the proportions being unusually even. The average yield of the ore per ton in bullion was \$31.14, and the average assay value was \$36.92 per ton. Such a showing of any one mine in one month in a newer mining region would at once create a great boom. Yet many persons imagine the Comstock "played out."

The Russell Process.

With this issue, of the MINING AND SCIENTIFIC PRESS appears the first of a series of articles on the "Russell Process in Its Practical Application and Economic Results." As the subject will be continued through several numbers, it will be well to give here a short description of the process, and a summary of the remarkable results so far attained by it.

The chemicals used in the process are any form of copper soluble in a hyposulphite solution, an acid and a carbonate of an alkali—this term including, as in works on chemistry, both the mono-carbonate and bi-carbonate. Of the above chemicals the most important is the compound of copper from which is formed the cuprous hyposulphite generally known as the "extra solution." The object of the use of the copper compound is partly the neutralization of caustic impurities accumulating in the stock solution, but mainly the dissolving and removing of gold and silver compounds by the action on them of cuprous hyposulphite. Whether the copper compound is added to the ore during the leaching with a hyposulphite solution or before, in some other solution, is immaterial. In the former case a compound of copper soluble in hyposulphite solution is dissolved in it and the resulting compound solution allowed to pass through the ore. In the latter case a copper compound in an aqueous or any other solution is introduced into the ore before the use of the hyposulphite solution. From this solution the copper is precipitated in the ore by carbonates or other compounds existing naturally in the ore or mixed with it. The redissolving of the precipitated copper by the hyposulphite solution subsequently used forms the "extra solution" in the ore. The use of the acid is for the purpose of destroying caustic alkali in the leaching solution. It is not required in the treatment of raw ore, and seldom in the treatment of roasted ore, as the "extra solution" also acts as a neutralizer of caustic impurities. As the solution dissolves no more lime from ores containing 50 per cent than from those having one-half of one per cent, the amount of acid required is independent of the lime contents of the ore. The soluble carbonate may be used: First, for the purpose of removing impurities other than caustic alkali from the solution; or for precipitating the lead in the ore. Second, for precipitating the lead by itself from the solution containing the precious metals and lead. In the first case the carbonate is added to the solution before using upon the ore, and in the second case to the solution already used.

Application of the Process.

Mechanically in its ability to treat the finest and coarsest material, as well as chemically, the process has a wide applicability. Except in one case, that of raw slaty tailings from ore crushed originally for amalgamation and through a 50-mesh screen, no difficulty has been experienced in the mechanical treatment of any material. In the case referred to, the ore was ground in the amalgamating pans, and subsequently, before being subjected to the leaching process, re-treated and again ground in the pans. Even in this case of extremely fine material the drying of the tailings at a low red heat removed the difficulty entirely. In the treatment of well-roasted material there can be no mechanical difficulties even in the case of the finest material. Well-roasted fine dust from the dust-chambers of a Stetefeldt furnace of such a fineness that 90 per cent passes a screen of 150 meshes per running inch, leaches as rapidly, owing to its light condition, as the coarsest material from the "chaff." On the other hand, ore crushed by rolls through an 8-mesh screen, yielded 92 per cent by leaching. Chemically speaking, the applicability of the process seems to have no limit. Partial analyses of some of the ores so far treated are given in the following table:

	PbS	ZnS	FeS ₂	PbCO ₃	CaCO ₃	MgCO ₃	Cu
Sombrerete.....	25%	8%	20%	1.5
".....	15	10	50	2.0
".....	10	8	25	1.4
*Yedras.....	19	82	37.2	33%	0.0
Cashimiriachic.....	7.6	11.9	5	0.4
Ontario.....	11	13	8	1%	0.3
".....	2	0.5	0.5	2	0.2
Marac.....	3	Trace	Trace	5	1.5	0.6
Lake Valley.....	2	0	0	4	0.0
".....	3	0	0	5	2	0.0

*Yedras ore also contained 9.3% of arsenic.

In some of the ores so far treated the percentages of various elements met with have risen as high as 4 per cent copper, 20 per cent arsenic, 18 per cent zinc, 25 per cent lead, 35

per cent lime and 30 per cent iron (as pyrites). Concentrates containing 80 per cent of iron, lead, zinc and copper sulphides yielded 90 per cent after roasting. From the experience thus far this amount or form of occurrence of the base metals in an ore seems to make no appreciable difference with the results by the process. The values of the materials so far treated vary from 8 ounces tailings to 14 ounces raw ore, and from 12 ounces to 100 ounces roasted ore. For roasted ores containing lime, the expense of treatment are usually less than for those that contain none. In all cases the amount of salt required for roasting is less than for either the ordinary leaching process or amalgamation. The presence of arsenic or antimony in an ore seems to make the use of salt practically unnecessary when the Russell process is used. Requiring only one-fifth as much water for roasted ore, and about one-thirtieth as much for raw ore, as amalgamation, the great applicability of the process to dry regions is apparent. A very wide application of the process will probably be in the raw treatment of ores, but a still wider application in connection with concentration in the treatment of low-grade raw ores containing lead. The small cost of the plant required, the high extraction of the silver and saving of the lead by the two processes, combined with the low cost of treatment—from \$2 to \$3 per ton—opens up a very promising field.

The Plant.

The plant required for this process, needing no machinery, is entirely independent and complete in itself, and may be situated wherever convenient, without reference to the position of the crushing plant for raw ores, or the crushing and chloridizing plant for ores requiring roasting, except as regards the easy transportation of the raw or roasted ore between the two plants. Consequently, when either of the two above-mentioned plants for the preparation of the ore already exists in connection with amalgamation or concentration, the change to the Russell process alone, or to this process in connection with concentration, can be made without stopping or interfering with the above plants. The estimated total cost of a 35-ton leaching plant now being constructed as an addition to the Marsac mill at Park City, Utah, is \$3500, including grading, foundation, building, tanks, apparatus, etc., up to the shipment of the product. The cost of a plant of the same capacity for the treatment of raw ores would be about \$2500. The erection of a plant for the Russell process, in connection with the crushing or the crushing-chloridizing plant of many amalgamating-mills and leaching-mills would result in a doubling of the crushing and roasting capacity, in addition to the less expense of treatment and higher results obtainable. The cost of treatment by the Russell process, including the preparation of the ore, varies from \$1.25 for raw tailings to \$3 for raw ore (including crushing). The cost of crushing, chloridizing, leaching, etc., varies from \$4 to \$5.50.

We commend the above figures particularly to the mine-owners of Leadville and Aspen, Colorado. At the former place dry ores containing 15 to 18 ounces are thrown over the dump. On ores from Aspen the smelter's returns are based on 95 per cent of the ore value, with freight and smelting charges varying from \$20 to \$25. At that place 15 ounces ore is thrown over the dump, 15 to 30 ounces ore is left untouched, and only such ore as assays over 30 ounces can be disposed of. The total expenses connected with the shipping and disposal of the product from the Russell process, including the difference between the New York price of silver and gold and the price actually obtained, amount to 2½ to 3 per cent of the value of the ore treated. At the Ontario the corresponding expenses on bullion from amalgamation are 2½ per cent of the ore value. If we here take into account the less price paid for gold in the product from amalgamation as compared with that of the Russell process, the expense amounts to 3½ per cent of the ore value.

Comparative Tests.

As to the superiority of the Russell process over the ordinary leaching process and amalgamation, both as to expenses and results, the statistics given are most convincing. Six comparative runs between this process and the ordinary leaching process have so far been made in the various mills in which the process has been introduced. These runs each cover a

period ranging from two months to two years, end in each, except that at the Ontario, the number of tons treated per day varies from 25 to 70.

At the Ontario, in the two-ton experimental plant erected for the purpose of testing the Russell process and comparing it with amalgamation and the ordinary leaching process both as to expenses and results, and in which the comparative tests were continued for over two years, the extraction by the Russell process on chloridized ore exceeded that by the ordinary leaching process to the extent of 26.2 per cent of the value of the ore, or 22 6 ounces per ton. On ore roasted without salt the extraction by the ordinary process was only 35 per cent, and by the Russell process 85 per cent, a difference of about 35 ounces per ton.

The second competitive test between the two processes occurred at Silver City, New Mexico, on the raw tailings from the Bremen mill. The test was on a scale of 15 to 30 tons per day for three months, the average difference in extraction for the whole run amounting to 25 1/2 per cent of the value of the ore in favor of the Russell process. In the test at this and other mills, it should be understood that when the difference between the results by the two processes was great, the tailings from the ordinary process were treated by the "extra solution" before being thrown away.

The third opportunity for comparing the two processes occurred at Lake Valley, New Mexico, the comparison covering a period of eight months, the amount of ore treated varying from 20 to 60 tons per day. The result showed the average difference in extraction in favor of the Russell process to be 30 per cent of the value of the ore. The ore treated in this mill averaged for the last five months only 12 ounces per ton, but continued to be profitably treated until the supply was exhausted.

At Sombrerete, Zacatecas, Mexico, a large mill is now being constructed for the Russell process by the Sombrerete Mining Co. This mill will have rolls, the largest Stetefeldt furnace ever constructed, and leaching tanks of such a capacity as to hold 50 tons per charge. In the comparative test made in the old mill, and which was continued for two months, the difference between the results by the ordinary leaching process and those by the Russell process were in favor of the latter to the extent of 22 6 10 per cent of the value of the ore, or about 11 ounces per ton.

The fifth competitive run between the two processes took place at the 40 stamp mill of the Anglo-Mexican Mining Co., at Yedras, Sinaloa, Mexico, and lasted 14 months. This run was divided into three parts, the relative number of tons treated by each process varying, as the plant was being altered for the Russell process, the time occupied in altering being very long on account of the location of the mill in the most inaccessible portion of Mexico. During the first two months the Russell process was run on a scale of only two tons per day, and the ordinary process on 40 tons per day. The extraction by the Russell process exceeded that by the ordinary process by 18 1-10 per cent of the value of the ore, or 11 2 10 ounces per ton, or at the rate of about 155,000 ounces per year. During the second part of the 14 months the Russell process was run on about 15 tons per day and the old process on about 25. The result of the run was in favor of the Russell process by 17 1-10 per cent of the value of the ore. During the third part of the 14 months the Russell process was run on a scale of about 30 tons per day, and the ordinary process on 10 tons. The difference was in favor of the former by 16 per cent of the value of the ore, or about \$110,000 per year, the grade of the ore being somewhat lower than on the first run.

The sixth competitive run between the two processes took place at the 60-stamp mill of the Cusihuiriachic Mining Co. in Chihuahua, Mexico, the tests covering a period of over a year and included the treatment of about 20,000 tons of ore, containing 750,000 ounces of silver. The main part of the competitive run between the two processes took place inside of nine months, the whole time being divided into three periods of two to four months each. The results showed that during the months in which the Russell process was used on one-half of the ore and the ordinary leaching process on the other half, the net mill profits per ton were 70 per cent greater and the net mill profits per month were 85 per cent greater than in those

months in which the ordinary process alone was used. In the months when the Russell process alone was used on all the ore, the net mill profits per ton were 90 per cent greater, and the net mill profits per month 219 per cent greater—corresponding to \$15,000 per month—than when the ordinary process alone was used. The total net mill profits, due to the use of the Russell process over the ordinary leaching process, were at the rate of over \$190,000 per year.

Lixiviation vs. Amalgamation.

Five competitive runs have been made at various mills between the Russell process and amalgamation. The first covers a period of two years in the two-ton experimental plant at the Ontario mill. In this plant were made the first experiments on the Russell process, and to the liberal management of the Ontario Silver Mining Co. will be due much of the benefits mining and metallurgical interests may obtain from the process.

The result of the first cooperative run on Ontario ore showed that on ore crushed through a 16-mesh screen and roasted with 12 1/2 per cent of salt the results by the Russell process were higher than on ore crushed through a 30-mesh screen and roasted with 17 per cent of salt and treated by amalgamation. On ore roasted without any salt the results by amalgamation were only 35 per cent, while those by the Russell process were 85 per cent, a difference of 50 per

the total net difference over \$8 per ton, or at the rate of \$172,000 per year.

The fifth comparative mill-run was begun at the Ontario mill in November last, and is still being continued. From various causes, but chiefly from lack of sulphur in the ore, amalgamation during the above period gave very poor results. The foreman, Mr. Moffat, removed the difficulty to a considerable extent, however, as shown by the difference in results between May and June, by mixing pulverized sulphur with the salt used in roasting. This comparative run shows not only how great may be the difference between the two processes, but also how little the results of the Russell process are affected by a change in the composition of the ore. The difference in mill workings by the two processes, and in favor of Russell's, is given below by months:

	Difference per cent.
November, 1887.....	11.6
December, 1887.....	8.5
January, 1888.....	10.1
February, 1888.....	10.1
March, 1888.....	20.4
April, 1888.....	12.9
May, 1888.....	13.4
June, 1888.....	19.5
Average difference.....	13.8

The average extraction in gold by the Russell process for the same eight months exceeds that of amalgamation by 15 per cent of the gold value of the ore. In regard to the gold there is a still further difference on the side of the

KEITH'S CONSTANT CURRENT ELECTRIC MOTOR.

cent, or 35 ounces per ton. The expenses of leaching may also be put at from \$5 to \$6 per ton less than those of amalgamation at that time.

The second run was made at the Marsao mill, on Daly ore. This ore being crushed and chloridized solely with reference to obtaining the best results by amalgamation, and not with reference to the leaching, the results by leaching fell 2 per cent short of those by amalgamation during the first two weeks of the run, but at the latter part of the run averaged 1 1/2 per cent higher than by amalgamation. In this case, as for Ontario ore, the expense per ton would be considerably less than by amalgamation.

The third competitive mill-run between the two processes was made at Lake Valley, New Mexico, extending over a period of two months, and on a scale of 30 to 50 tons a day by the Russell process, and five to six tons by amalgamation, the leaching charges being 18 to 20 tons each, and those by amalgamation 1 1/2 to 2 tons. Not only were the expenses of the Russell process much less, but also the extraction by it was 12.4 per cent greater.

The fourth competitive run between the two processes took place at Cusihuiriachic, Chihuahua, Mexico. Two pans and one settler having a capacity of 1 1/2 tons to the charge were run in competition with the Russell process in tanks of 8 to 10 tons each. Although both the crushing and the roasting were conducted solely with reference to obtaining the best results by amalgamation, and not for leaching, the results were in favor of the Russell process by an additional extraction of 11.4 per cent, or 5.7 ounces per ton more than by amalgamation. This, taken with the less expense in leaching, made

Russell process in that the gold in the product by that process is paid for at the rate of \$20 per ounce, while for the gold in the bullion from amalgamation nothing is obtained. Referring again to the extraction of silver, the average amount of silver in the Ontario battery sample being 47 ounces per ton and the number of tons treated daily being 90, the additional extraction in silver alone by the Russell process exceeds that by amalgamation at the rate of over 200,000 ounces per year. Taking into account also the decreased expense of about \$4 per ton, the total net difference on the side of the Russell process is at the rate of over \$300,000 per year.

Lack of space prevents us from entering further here into the details of this remarkable process. We can only commend this subject to the careful consideration of mining men and metallurgists.

THE Wood River mine-owners are very anxious to have a reduction of freight rates on ore. Many small claims have had to close down, and the majority of even the heaviest producers are only extracting and shipping enough to pay expenses. It is claimed that with reasonable ore rates even the smaller claims would ship from one to five carloads a day. The quantity of Wood River ore that would seek a market would be about 250 tons per day. They do not want to pay over \$10 per ton.

Iron deposits, which bid fair to become valuable properties, have been discovered on Hood's canal, near Lake Cushman, W. T.

THE President has nominated Colonel Thos. L. Casey Chief of Engineers of the United States Army.

Electric Motors.

There are two fundamental systems of transmitting and distributing power by electricity. One is called the "constant potential" and the other the "constant current."

The office of the primary power is to drive a dynamo-electric machine to produce electrical energy which is reconverted to power by the electric motor or motors which receive it. The electrical energy is the condition of the power during transformation and translation. Power is expressed in foot-pounds. That is, pounds of mass multiplied by feet of motion. Electrical energy is expressed in volt-amperes. That is, a pressure multiplied by a velocity.

It makes no difference in a horse-power whether one pound moves 33,000 feet or 33,000 pounds move one foot; nor whether the pounds be more or less, as long as the feet are of the number which when multiplied by the pounds the product be 33,000. It makes no difference in one-horse power of electrical energy whether 746 amperes have one volt electro-motive force or 746 volts produce one ampere; nor whether the amperes or volts be more or less, as long as their product be 746 volt-amperes. For short the volt-ampere is called a "watt," and 746 watts equal one horse-power or 33,000 foot-pounds.

By the constant potential system of electrical transmission of power the dynamo at the primary power (water-power for instance) is constructed to produce its electrical energy having a constant, invariable number of volts; but the number of amperes varies constantly, as the work done by the motors on the circuit varies.

By the "constant current" system the dynamo at the primary power is constructed to produce its electrical energy having a constant, unvarying number of amperes; but the number of volts varies constantly in proportion to the variations in the work done by the motors on its circuit.

Under the "constant potential" system the volts are small in number and the amperes large. Under the constant current system the volts are large in number and the amperes small. For instance: 110 volts \times 678.2 amperes = 100 horse-power; 3000 volts \times 24.8 = 100 horse-power.

Under the former system the copper conductors between the dynamo and motors must be large in order to accommodate a large number of amperes. Under the latter system the conductors are small, because they have to carry a small number of amperes.

The conductors in the constant potential system may be likened to a large ditch carrying water to many water-wheels, which it reaches through pipes from the ditch, a pipe to each wheel, and the same number of feet fall to each. The larger must have large pipes, and use more water than the small ones, and in proportion to their size and power. So from the large conductor smaller ones branch to the electric motors, and each motor uses of the amperes of electricity in proportion to its capacity or work. Whatever water goes to each wheel goes to no other wheel. Whatever amperes of electricity goes to a motor goes to no other motor.

The conductors in the constant current system may be likened to a stream having a number of successive falls in it, and at each fall a water-wheel, the falls varying in height with the power required from the wheel. Each wheel uses all the water, and the water flows from wheel to wheel. So from the dynamo the amperes all flow successively through all the motors, and the motors vary in their power by their size and capacity of utilizing a greater or less number of the volts.

Constant potential motors are constructed to automatically vary the number of amperes of electric current they use in proportion to the work they do. Constant current motors are constructed to automatically vary the number of volts of electric energy they use in proportion to the work they do, as does a steam-engine governor vary the amount of steam admitted to its cylinder in proportion to the work.

In our issue of June 9th last we illustrated one of Prof. Keith's constant potential motors. In this issue we illustrate one of his constant current motors. It will be observed that their forms are substantially the same. The bracket at the pulley serves to sustain the governor. We shall take an early occasion to describe the construction and operation of this latter ingenious mechanism.

MECHANICAL PROGRESS.

The Literature of Different Irons.

A Philadelphia correspondent of the N. Y. *Iron Age* calls attention to the fact that while very much is being done in the way of investigation into the chemistry of Bessemer pig metal, very little is being done toward determining the character of foundry irons by actual analysis. We condense from his communication as follows:

The paper of Mr. Meissner upon the "Chemistry of Foundry Irons," following the contributions of Messrs. Keep, Fleming and Osterbridge in this country, and Turner in England, indicates that the attention of chemists and physicists is being directed in a channel too long neglected. For years the chemical and physical properties of Bessemer pig metal have been thoroughly investigated, and the composition and characteristics of rails, plate, etc., made from it have received almost a monopoly of attention. The results of these investigations have amply compensated for the labor and money devoted to them by the marvelous advance made in the production of manufactured steel, both as to quantity and quality. But while this progress has been taking place, we have practically stood still in the investigation of foundry and mill irons, although in the latter specialty more has been accomplished than with foundry irons; but the literature on the subject of foundry irons is less than its importance demands.

An approximate estimate of the quantity of foundry iron produced in 1887 is between 1,000,000 and 1,500,000 tons, and yet how little of it is used with a full appreciation of either its composition or other qualities. The mere matter of grading pig iron is but little understood, and traditions or customs have too often more to do with an order sent to the furnace than an intimate knowledge of the composition or characteristics of the metal used.

It is an open secret that a coating of rust upon a broken pig many times makes it acceptable and satisfactory, when, if the true face or fracture were visible, the iron would be condemned. Again, the product of certain furnaces is deemed essential, either by the foundry or by the parties who patronize the foundries, and a few tons of these standard irons kept in stock or a few pounds added to a cupola charge satisfy the supposed necessity.

This notion is not confined to pig iron, but some ores come under the same category, and the fact that ore from a certain mine or iron from a certain furnace is used is accepted as fulfilling all the requirements, whether the proportion is large or small. But that practice without investigation is not to be compared with that which carefully tries and proves the adaptability of the material used.

Mr. Meissner emphasizes the fallacy of some notions, as to the necessity of certain irons, by the analysis of Scotch pig irons, which are deemed so essential to success that they have within two years been carried into the Mississippi river and by rail to Chicago and other points. The question arises: Is this iron imported because of its cheapness, or on account of its quality? If for the former reason, our Scotch friends have the ideal cheap iron, or our Birmingham iron producers are sadly deceiving themselves for taking the cost of Birmingham iron at a price which is above the estimates sent out from that district.

An analysis of the figures shows that it is not cost but quality which causes this importation, and if quality, what were the very valuable characteristics which make it so necessary for foundry use? If the chemical constitution does not show the desirable qualities, what do physical tests determine?

It is hardly presumable that, as one contributor to the limited literature asserts, "we believe that the time is coming when pig iron will be sold on its chemical analysis, instead of the crude methods of grading at present in vogue." An investigation of the reasons why irons of certain compositions give specific results will be to the advantage of both producers and consumers. Our blast-furnace managers will find interesting nuts to crack in some of the analyses presented by Mr. Meissner, and a public comparison of results obtained will do much to awaken both the producer and consumer to a realization that without assuming that we must closely follow any fixed rules of chemical composition much can be done toward properly appreciating the merits and demerits of iron of certain grades or analyses. Such appreciation will then be based upon characteristics of the metal as determined by specific tests, and not upon visionary or uncertain reasons.

We are all familiar with the statement of a manager of a large Southern industry who facetiously asserts that "whether iron goes to one grade or another depends upon the condition of the grader's liver." Unfortunately we have relied upon a method—it cannot be called a system—which varies so much that the only grade which approaches uniformity is white iron; and from this, different blast furnaces grade upward to 4 to 6, to 16 or even to 20 grades, making the determination a fine art, requiring an expert's opinion and probably in many cases developing no chemical change between two or three numbers.

A NEW TUBE-MAKING PROCESS.—An English paper reports that Swansea is to receive a new

and important addition to its metallurgical industries. The London Siemens Steel Co. are about fitting up extensive works for utilizing a new method of manufacturing steel and copper pipes, invented some two or three years since by Herr A. Mennsmen, and now in successful operation in that country. The English firm will confine themselves to the manufacture of steel pipes. A concession has also been granted by the inventor to a French firm in Paris who will use the same method in that city for the manufacture of copper pipes. An estimate of the importance of the new process may be gathered from the fact that the capital of the German syndicate was \$300,000. The principle involved consists in casting an adjustable core, which accommodates itself to the contraction of the metal on cooling, and thus prevents cracking. The steel cup obtained in this manner is then rolled in an ordinary train. The special feature of this core used in the casting constitutes the patent granted. The principle is also applicable to gun-making, and by it the difficult and expensive process of boring is avoided.

NEW PROCESS FOR WIRE MANUFACTURE.—It is recorded that Mr. H. A. Williams of the Williams Manufacturing Co. of Taunton, Mass., has invented a machine for cheapening and improving steel or iron wire, which is calculated to make a change in many branches of industry in which iron, steel, copper and brass wire are used. The invention, which has just been patented, consists of a series of rolls in a continuous train, geared with a common driver, each pair of rolls having a greater speed than the pair preceding it, with an intervening friction clutch adapted to graduate the speed of the rolls to the speed of the wire in process of rolling. The entire process of manufacturing the smallest sized wires from rods of one-half inch is done cold. The new process obviates the danger of unequal annealing, and of burning in the furnaces, and the wire is claimed to be more flexible and homogenous than that produced by the common processes, and capable of sustaining greater longitudinal strain. It is, therefore, specially adapted for screws, nails, cables, pianofortes, and many other uses, and copper wire made by this process is claimed to have possessed of greatly increased electrical conductivity. A new corporation, called the Williams Wire Machine Co., will be formed to manufacture the machines at Taunton.

THE SAND-BLAST FOR CLEANING WALLS, ETC.—Amateurs adopt new ways and improved methods more readily than your skilled workman. As occasion offers, let amateurs try the sand blast for cleaning old stained and dingy stone walls of buildings instead of using wire brushes; also for cleaning rust from iron and sand from castings without scraping. Possibly the sand-blast may answer for cleaning floors, stairs, interior walls, ceilings and without washing or scrubbing. No patent on these adaptations of the sand-blast.

GERMAN IMITATIONS.—Making so-called "wrought-iron" anvils in Germany, and branding them "Trenton," after the New Jersey town of that name, is, no doubt, an enterprising procedure, but the Eagle Anvil Works of Trenton finds the joke has a serious side, as a good many of the German anvils get broken, and are sent to them by users to be repaired, under the mistaken impression that they were made by them. Each of theirs bears an eagle as a distinguishing brand.

STEEL FOR SMITH'S USE.—The *Railroad Gazette* reports that a firm which has added Bessemer converters to their original iron-making plant, lately sent out a large number of steel bars and rods for smiths' use. These bars were supplied to customers who had formerly used the wrought-iron bars made by this firm. The users have, however, made no complaint, and apparently found that the steel could be as readily worked and welded as the iron formerly supplied.

PHENOMENAL WIRE DRAWING.—William Riddell & Co., Glasgow, has finished for the Glasgow exhibition two pieces of wire, one of brass, 65 miles long and 48 w. g. in diameter. The other is of copper, 111 miles long, 48 w. g. in diameter, and was reduced at one process from 22 w. g. to 48, taking 40 hours continuous running to run it off. Except in the precious metals, this length has probably never been exceeded, and certainly never without annealing.

CORRUGATED IRON FOR DWELLING HOUSES.—An English writer urges the introduction of dwelling houses made of corrugated iron. He claims that they would be much cheaper than dwellings of brick or stone, and would thus effect reductions in rent. Being lined with wood they would necessarily be warm in winter. To make them cool in summer he suggests that they may be built on the plan of the Indian bungalow.

TO DETERMINE MANGANESE STEEL.—The *American Analyst* says that an approximate idea of the amount of manganese contained in steel can be ascertained by the means of the magnet. A magnet capable of lifting 30 pounds of ordinary steel or iron will only lift a few milligrams if the metal contains 20 per cent of manganese. So small a quantity of 8 per cent of manganese will nearly neutralize the magnetic attraction.

SCIENTIFIC PROGRESS.

Contradicting Mr. Darwin.

When Darwin was a young man the work that did more than anything else to give him a wide reputation as a rising man of science was his investigation of the coral reefs of the Pacific during the cruise of the *Beagle*, and his famous theory with regard to their origin, which, for half a century, was accepted by the scientific world as the correct explanation. Darwin's theory is now rejected by some of the leading authorities on deep-sea investigation. The most recent contribution to this subject is the work just published by Prof. Alexander Agassiz on the oceanic researches of the United States steamer *Blake*, during which his investigations of the coral reefs off the coast of Florida have led him to reject the Darwinian theory as correctly explaining their origin.

It was Professor Darwin's belief that the reef building polypi, which exist only at comparatively short distances below the surface, laid the foundation of their coral structures in shallow waters, and that the gradual subsidence of the ocean had enabled them continually to add to the height of their structures, while they themselves remained in the limited depths of the reef coral zone. In this way he believed the great oceanic groups of atolls which rise from very deep water were formed, and he wholly rejected the assumption that immense piles of sediment heaped on the floor of the oceans far remote from land could have made the basis for the coral formations.

In Mr. H. P. Guppy's recent paper on coral reefs he shows that this explanation, which Darwin rejected for lack of evidence, is the very theory that the recent researches have tended to support; that many of Darwin's areas of subsidence are, in fact, areas of elevation, and that the discoveries of Murray, A. Agassiz, Buchanan and others go to show that, upon vast deposits of calcareous remains, deep-sea corals are reared until they reach a level suitable for the growth of reef corals.

Professor Whitney tells us that as late as 1794 the leading text-book on geography used in American schools announced that the Alleghenies were the most considerable mountains in North America and that "the Andees and Alleghenies are probably the same range, interrupted by the Gulf of Mexico." In the present state of geographical knowledge such blunders are no longer possible, but some of our long-cherished views on problems in physical geography are receiving severe treatment at the hands of the latest investigators.

FEEDING THE FLAMES.—*London Iron* says: "Most people are familiar with the expression 'feeding the flames,' which is usually to be met with in accounts of conflagrations which are sustained and extended by reason of the devouring element attacking inflammable substances within its reach. It is, however, in another sense that we now use it, namely, that of sustaining a domestic or other fire by means of materials by which humanity has hitherto been fed. To put the matter plainly, we received a short time since a sample of block or what is generally known as patent fuel, with a request that we would test it and publish our opinion." The editor remarks that he will take an early opportunity to experiment with the fuel and gives the following as the formula by which the fuel is manufactured: Add to 1 ton of smudge 5 pounds of flour, 5 pounds of resin, 1 pound of salt, 1 pound of sodium, 5 pounds of sugar, and from 2 to 3 per cent of pitch. The cost of the whole of the ingredients bought wholesale is about 1s. 1d. The editor then continues: "But what we do not at all see is the force of literally 'feeding the flames' on those commodities which so many thousands have such a struggle to obtain for feeding themselves and their children. It may be that this point can be satisfactorily settled by Mr. Jackson, and therefore—to use another old expression—we pause for a reply. This is certainly 'feeding the flames' with a vengeance!"

PRIZE STUDIES OF TORNADOES.—The *American Meteorological Journal*, desiring to direct the attention of students to tornadoes, in hopes that valuable results may be obtained, offers the following prizes: For the best original essay on tornadoes or description of a tornado, \$200 will be given. For the second best, \$50. And among those worthy of special mention, \$50 will be divided. The essays must be sent to either of the editors, Professor Harrington, Astronomical Observatory, Ann Arbor, Mich., or A. Lawrence Roth, U. S. H. L. Meteorological Observatory, Readville, Mass., U. S. A., before the first day of July, 1889. They must be signed by a nom de plume, and be accompanied by a sealed envelope addressed with same nom de plume and enclosing the real name and address of the author.

VELOCITY OF THE SOUND OF FIRE ARMS.—Many experiments have proved that the velocity of sound, obtained by observing from a known distance the instant of the discharge of a rifle and the arrival of the sound of the detonation at the place of observation, is frequently greatly in excess of the normal rate of propagation. To determine the cause of this increase and the laws which govern it, a series of experiments have recently been carried out by M. Journe, who has presented a memoir on the subject to the Paris Academie des Sciences.

His experiments show that if a bullet is fired from a rifle against a plate of cast iron, then so long as the velocity of the bullet is in excess of the normal velocity of sound through air, the noise of the detonation and of the bullet striking the plate reach an observer situated in the plane of fire behind the plate at the same instant. If the distance of the plate from the rifle is increased till the velocity of the bullet before reaching it is reduced below that of sound, then the noise of the detonation reaches an observer before that of the shock against the plate. Hence the author concludes that the bullet, so long as its velocity is greater than the normal velocity of sound, is the seat of sonorous disturbances, resembling in character that due to an explosion, and this view he has substantiated by further experiments.

RESOLVING HYDROGEN, OXYGEN, ETC., INTO THEIR ELEMENTS.—A paper by Professor Gruenwald, recently published in the *Chemical News*, upon the spectra of hydrogen, oxygen and aqueous vapor, is an extremely important one. Gruenwald claims to have discovered, from the spectra of these gases and vapors, that hydrogen is a compound of one volume of a primary substance (b), with four volumes of another primary substance (a), and is therefore a compound substance, analogous to ammonium (N. H₄), the volume of which, on its dissociation at a sufficiently elevated temperature, is in the proportion of two to three. The substance (a) is the lightest of all gaseous bodies—much lighter than hydrogen; and (b), if we regard (a) as a univalent element, is a pentavalent gaseous element similar to nitrogen. He has also found oxygen, carbon and nitrogen to be compounds of similar substances. The element (b), noted above, corresponds with the assumed element occurring in the sun and known as "helium," thus proving that hydrogen is dissociated in the sun's atmosphere. Another unknown substance present in the sun's corona which gives the spectral line 1474, he concludes, is due to the other constituent of hydrogen (a). Much more extended observations will be necessary to prove the correctness of this alleged discovery; but the facts brought forward by the author are sufficiently confirmatory to justify the most thorough investigation of the matter.

ELECTRICITY IN PROBING.—Dr. John H. Girdner has made an extremely ingenious application of electricity in a telephonic bullet probe. The operator covers both ears with telephonic receivers to which are connected two wires. One of these terminates in a piece of steel, which the patient holds in his mouth, or which may be applied to other parts of the body where a good contact can be obtained. The other wire is attached to a delicate steel probe. Now, when the probe passes through flesh or tissue, or touches bone, nothing is heard by the operator, but when the point of the needle touches a lead bullet, the circuit is completed, and a clicking and scraping is heard in the telephone. The probe may be left in place, and serve as a guide to the knife. The manipulation of the probe is not difficult or painful and is not attended with danger. The invention is destined to increase largely the efficiency of surgical practice in cases of gun-shot wounds.

PLATINUM IN THE SUN'S ATMOSPHERE.—Messrs. Hinchins and Holden recently gave an account of certain investigations upon the solar spectrum, which seem to prove the presence of the metal platinum in the sun's atmosphere. This is the first time any lines corresponding to that element have been observed. They also find additional evidence of the presence of cadmium, bismuth and silver, which have always been considered doubtful, while the presence of lead, tin, potassium, lithium, and the cerium group is not confirmed.

CONTRACTING EFFECT OF ALCOHOL.—It is well known that sponge, wood, etc., when saturated with alcohol contract, while if saturated with water they expand. The cause of the dissimilar action may not be so well known, but is no doubt due to the fact that alcohol abstracts the moisture from porous substances. It is from this peculiar property of alcohol, in withdrawing water from organic tissue, that it derives its chief value as a preservative agent in the arts.

ADAMASCORITE is the local name of a mineral which is said to be found only in one place in the world and that is the State of Missouri. The stone is very peculiar in its structure and properties. Its cutting power is diamond-like, cutting away steel very rapidly, and still retaining an exceedingly fine edge.

DIAMONDS IN A METEOROLITE.—A cablegram from St. Petersburg, dated July 1st, says: A number of Prussian scientific men have discovered a quantity of small diamonds in a meteorolite that fell recently in the neighborhood of Kiev.

SILVERING IRON.—By a recent Austrian invention iron is given a silver surface by covering the iron with mercury and silvering by the galvanic process; then by heating to 300° C. the mercury is evaporated, and the silver firmly fixed.

A CEMENT FOR STOPPING CRACKS IN SINKS.—Take of litharge 20 parts and one of burnt lime in fine, dry powder. Make into a putty with linseed oil.

USEFUL INFORMATION.

Chinese Carpenters.

A correspondent of the N. Y. Iron Age writes to that journal as follows:

"Have just been having a time with the carpenters trying to get them to make a good joint. We are framing timbers for a shaft; and it is quite necessary that the joints should be well made, for the sine of one joint are perpetuated in all the other timbers as they are put in. The natives do very well with the tools they have. All their saws are like the ordinary huck-saws, and they are all sharpened as rip-saws, but are used indifferently for ripping or crosscutting. A line is made by snapping a string run through india ink and water instead of a chalk line, and their pencil is a piece of bamboo split up at the end and dipped in ink. The chisels are like ours, only far clumsier. Their planes are like ours also, save that they are pushed by both hands on a cross-bar handle across the top of the plane just behind the blade. Squares, bevel squares and the like are made by themselves from wood as they are wanted. Rabbeting planes and other special tools they likewise make when wanted, starting on a basis of a plane blade. A miter box they know not, and I think I must show them its virtues. Their hatchets are about the size and shape of our lath hatchets, but with about three times the amount of metal in them. A broad sash they do not have, but the adze is in constant use. The blade of the adze is about three inches wide and over all some four inches in length. Opposite the blade is a socket fitting on a wooden shank, which carries a straight handle. Their drills fit into a wooden shank, which is revolved by a strip of leather with one or more turns around the spindle and with the ends fastened to a straight stick, which is sawed like a fiddle-bow across the shank. The drills are sharpened like our drills for iron. A constant source of surprise is the suppleness of the native workman. You often see a carpenter standing by a waist-high bench with one foot on the ground and the other holding a piece of wood on the bench while he saws or planes it. They are very fond of sitting down to their work in positions we could not assume. A cramped position to a native is an impossibility, though it might be achieved by forcing him into a trunk."

The Ivory Trade is Dead.

Celluloid has or soon will effectually kill the ivory trade. The chief portion of the ivory of commerce has heretofore been derived from Africa and consists of the tusks of the large elephants of that country. The largest of these tusks sometimes weighed as much as 130 pounds and were valued as high as \$500; but there is not much doing in the business at the present time, and that little is constantly growing less. Nearly everything that was made of ivory a few years ago is now made of celluloid, and a great many other things besides. How many pianos in these days have ivory keys? Only the most expensive; and then, too, combs and brushes, umbrellas and cane handles, hiliard and pool balls, and even dice are made of celluloid which one can scarcely tell from ivory, so perfectly are they done. The latest thing, however, in the celluloid line is in the shape of playing-cards, and they will supplant the old fashioned cards altogether when they become more generally known.

Old and broken hiliard balls that are only slightly chipped or broken are readily turned down into balls suitable for hagatelle or parlor games, but those that are badly broken are thrown away as useless. If the billiard-rooms should all close up we should find little to do in the line of ivory manufacture. All first-class billiard saloons are provided with ivory balls, for the celluloid imitations have found but little favor in the eyes of hiliard players. With the pool table, however, the case is different, for the majority of pool sets are made of celluloid. In New York, where 100 sets of ivory pool balls were sold two years ago, less than 20 are now sold. Celluloid is now almost exclusively used in that branch of manufacture.

SOLDERING HOLES.—The *American Artisan* says: There are many people who think it is an easy thing to solder a hole in an old tin pan, but, like many other tricks of the trade, can only be acquired by practice. The great trouble with most persons when they try to solder anything is that they do not get the work clean—that is, scraped bright; then the tin may be all scraped off, and if they try to solder with rosin the solder does not stick. When acid is used, there may be so much on the article that the acid does no good. Then the soldering copper is apt to be too cold or too hot, and the result will be that a poor job is done.

STEEL-TIRED WHEELS.—It is stated that the Pennsylvania Railroad Company is obliged to replace annually one out of every 250 of its chilled cast-iron wheels, or four per cent. On the Lake Erie line the figure is still higher, as six per cent have there to be replaced every year. The steel-tired wheels on the Pennsylvania give much better results, as only .01 per cent have to be renewed yearly.

OIL FROM INDIAN CORN.—A St. Louis party is engaged in the business of expressing oil from Indian corn, and the new industry prom-

ises a successful rival to the best vegetable oils. From a bushel of corn, costing 35 cents, a gallon of clear amber oil is obtained, worth 75 cents, and the solid substance remaining is said to be a better article of animal food than any of the oil cakes now on the market. If anticipations in regard to the business are realized, the farmer will be enabled to obtain a good price for his corn and feed it to his stock afterward—to eat his cake and have it, as it were.

A MAILING CASE FOR LIQUIDS.—A device has been patented for use in transmitting bottles through the mails or otherwise, with a view to preventing injury to goods which may come in contact with them from the breaking of the bottle and the spilling of its contents. This mailing case consists of a round wooden box with a screw top, there being inside the box a thick lining of absorbent material, which, in case of breakage, will quickly absorb the liquid and prevent damage that might otherwise occur. As a result of this construction it is claimed that the breaking of the bottle is not followed by the escape from the mailing case of any of the bottle's contents.

CAPACITY OF PUMPS.—To find (approximately) the amount of water a pump will move per minute, assuming a hundred feet piston speed as the standard, square the diameter of the water cylinders and divide by four; and inversely, to find the size of a pump to perform a required duty in gallons, divide the number of gallons by four and extract the square root of the quotient. The result is the diameter of water cylinder required.

BRASS ALLOY.—A very good brass is made of 16 pounds of copper, 8 pounds of zinc, and one-half pound of lead. The lead should be added after the copper and zinc have been melted together. These proportions of the different metals makes the best brass that can be made with zinc and copper. For very light castings the lead should be omitted, as it makes the alloy less fluid; but in heavy castings it makes them more solid and clean.

A HANDY FURNITURE POLISH.—Make a mixture of olive oil one part and vinegar two parts. Apply it to the furniture with a Canton flannel cloth. Rub dry with another cloth of the same material. A housekeeper who uses this polish on the finest varnished furniture says it has no equal.

GOOD HEALTH.

Shun Worry and Excitement.

Regarding the preservation of youth and vigor, we find the average of longevity greater than 50 years ago. We find some men and women decaying and growing old much sooner than others. We find one man as fresh and vigorous at 55 or 60 as another may be at 35. There must be causes for these differences in the preservation of the body. And as there are causes for such variations in the condition of the body, may there not be other causes, still unknown, which may tend to preserve physical and mental vigor for 100 years, or even longer?

Mental worry and disquiet, arising from any cause, is the strongest agent in "aging" men or women. It is an incessant source of exhaustion to the vital forces. You do so exhaust yourself when you worry about your business, your family, and about anything. It carves lines on the face and bleaches the hair. A peevish young woman at 20 will look old at 30, because her peevish or worrying thought represents so much of her force used to tear her down instead of building her up.

You can have responsibilities without always worrying over them. You do not make things a bit better through such worry. You only make them worse. Worry does not plan. It does not make a clear head. It does but fume, fret, and cause indigestion and old age. It affects your sleep at night. It causes you either loss of sleep or a poor rest when you do sleep. If you carry your cares to bed with you and they are "on your mind" when you fall into slumber, they will stay on your mind all night and cause you troubled dreams. There is a healthful sleep coming of the permanent, cheerful, composed, non-worrying frame of mind, two hours of which will give you ten times more rest, strength and refreshment than the unhealthy sleep coming of the mind which entertains care and worry and makes them continual guests.

We often use up our force faster than we make it. We work through a whole day's exciting business, and are then at a theater or some place of amusement until 10, 11, or 12 o'clock. So long as the body is awake there must be outlay of force to sustain it. There can be as much exhaustion in this search for excitement or amusement as in work. We get force to sustain the body in these ex-drafts upon it in two ways—either through artificial material stimulants or artificial mental stimulants. By artificial mental stimulants is meant the excitement caught and absorbed by crowds similarly influenced, and occupied as ourselves at night. It is not a healthful nor natural source of supply. It will eventually, if relied upon, strain the body and "age it" prematurely.

Mental stimulants and the mental intoxication coming from it is evidenced at noisy, turbulent public meetings, where thousands coming together, influenced by partisan prejudices,

likes and dislikes, stamp and cheer, and cry themselves hoarse, according as the sentiments expressed are agreeable or the reverse to them. It is the stimulus produced by great numbers of minds acting on each other. It is exhausting, and every one of the participants feels the reaction within a few hours.—N. Y. Sun.

BEE STINGS.—It is a common mistake to suppose that an angry bee is certain to sting on alighting upon a human hand. On the contrary, she will usually examine the skin very carefully first with the palpi—very delicate and nervous feeling organs, which are situated near the sting. It may seem that she stings at once and without care or reflection, but a bee can do a great deal in a very short space of time, in proof of which it may be mentioned that "she can flap her wings more than 400 times per second, and that each flap involves the extension and contraction, through a nerve impulse, of the muscles employed in the wing movements." This being the case, as Mr. Cheshire says, "we shall see at once that the 'no' time difficulty is removed." When a person has been stung by a bee, he should remove the sting immediately, "if possible, by the nail, running it in the direction opposite to that by which it has entered." On no account let him take hold of the sting with his thumb and finger, or a forceps, for then he will probably squeeze more of the virus into the wound from the poison bag, which is generally left attached to the sting. Although the virus of a bee sting is a strong acid, it does not always follow that an alkali will cure it. Much depends upon the temperament and constitution of the patient, and while arnica montana and ledum palustre will give relief in many cases, in others they are injurious. We may dismiss the subject of bee stings by giving the young bee-keeper two pieces of comfort—the first, that at swarming time the bees are nearly always in an exceedingly good temper; the second, that each time he is stung he will probably become less susceptible to the effects of bee poison.—Saturday Review.

NATURE'S "SAFE CURE" for kidney diseases, and many others, is strictly purified water. So important to health is strict purity in water that it may be reasonably presumed that one of the causes of the remarkable increase of kidney complaints is in the increasing impurity of water, consequent upon our multiplying population, manufactures, etc. Says Professor Charles Mayr: "Of the thousands of chemical compounds and waste products formed in the human system many require pure water for their solution and elimination; and water so overloaded with salts, etc., as average well water will not work satisfactorily. * * * Those who have never drank pure water do not realize what an effect such water has upon the kidneys; its effects better than that of acetates, nitrates, opiates or alcohol, and for people with tendency to kidney disease or dropsy there is no better drug than pure water."—Sanitary Era.

FAITH CURES.—The latest addition to the list of victims to the "faith cure" mania is a young lady at Des Moines, Iowa. Some weeks ago she sustained internal injuries by reason of a fall. During this time she has been treated by an exponent of the doctrine of healing through faith; but, failing to receive benefit therefrom, she at length resorted to medical advice. Had she done this at the time of the accident, all would have been well, but physicians now pronounce her case hopeless, as the morbid conditions have existed too long to be susceptible to medical treatment. We are a long-suffering people, and probably a few more deaths will occur through the treatment of workers of miracles ere legislative aid is invoked against this form of fanaticism; but it would seem as if we had nearly reached the point beyond which forbearance ceases to be a virtue.

CURIOUS PHASE OF DEAFNESS.—It is often said that persons afflicted with certain forms of deafness can hear perfectly in the midst of a tumult. A locomotive engineer, upon examination by a medical expert, was found to be deaf, and, although he protested that he could hear perfectly well while in the cab, he was suspended. Some time afterward, having made vain attempts to regain his defect, he applied for reinstatement, again urging the fact of his perfect hearing while on duty. Finally, to satisfy him, the physician rode with him upon a locomotive for a long distance and put him to every possible test. To the doctor's surprise, he found him able not only to hear ordinary sounds without difficulty, but also to distinguish whispers and faint movements that were inaudible to the physician.—Boston Post.

HOUSE DRAINING.—The drain inspector of Montreal says that housekeepers should not think so hardly of draughty, cool houses in winter. He believes that many people are saved from sickness in badly drained houses, owing to unpremeditated ventilation. "Often and often," said Mr. Lowe, "the houses we would consider the warmest and best is the one where sickness prevails, owing to the imperfect drainage. There is nothing like ventilation. Housekeepers do not pay sufficient attention to the sinks. Closed sinks will get dirty, and prove breeders of disease."

Some European towns forbid the occupation of newly built houses until four months after completion, as there are nearly 5000 gallons of water used in the mortar and building of 50,000 bricks, which should first dry out.

ENGINEERING NOTES.

Windmills as Sources of Power.

There is a very general opinion that a windmill is too old-fashioned a motor to be economical and efficient. This opinion is, after all, not very well founded, even although the clumsy specimens to be seen in this country would lend countenance to the notion. The windmill has been very much neglected by our millwrights and engineers. When once they come to devote as much time and attention to it as they have to other machines, we may expect to see very great improvements effected in its construction. Our electrical engineers, it seems to us, would do well in their own interest to extend a little of their attention to the windmill as a means of obtaining power for generating electricity.

An article on "Windmills for Generating Electricity," by Mr. A. R. Wolff, in the *Stevens Indicator*, draws attention to the employment of windmills as a source of power for charging accumulators. The writer maintains that the reason windmills have not thus far been put to practical use for the generation of electricity is not due to the first cost of the motor nor to any lack of economy in its operation. The windmill, also, he points out, is not so irregular in its revolution as many suppose, the fact being that the leading American makers employ governing apparatus which automatically so varies the extent of surface presented to the wind that a practically uniform rate of revolution is obtained irrespective of direction and varying velocities of wind, for all winds exceeding a velocity of six miles per hour.

This latter velocity must be reached before windmills of good design, as ordinarily constructed, operate at the rate of revolution for which they are set. It has been found, by experience, that on an average, for at least eight hours out of 24 hours of each day, the wind exceeds this velocity of six miles per hour, the average velocity of wind, during the eight hours of run, being 16 miles per hour. Total calms in excess of two days' duration are practically unknown in the United States. The fact that the windmill is at rest, often at short intervals, aggregating not quite 16 hours out of the 24, is no objection to the use of this motor for the purposes of driving dynamo machines to charge electrical accumulators, for one of the very features and acknowledged requisites of such accumulators should be that they can be charged spasmodically, at will, and at odd times. Mr. Wolff is of opinion that the reason why windmills are not more employed than they are is because the accumulators are not yet a satisfactory and assured success. The windmill at the present day, he maintains, is in a developed state, a practical success, ready and available for this new use at once. It awaits the electrical accumulator that is a thorough practical success.—Mechanical World.

Electrical Transmission of Power.

As an interesting instance of the transmission of power by electricity over long distances, the *London Electrician* refers to that of the Phoenix gold mines in New Zealand. The current is generated by two No. 8 Brush machines, each capable of giving 26-horse power. They are driven by Pelton water-wheels, with a head of 180 feet. The current is conveyed to the motor about three miles distant, and back again by a No. 8 B. W. G. copper wire (0.165 inch thick) nearly six miles long, supported on telegraph poles. The power lost in the line is only three-horse power. A Victoria motor is used, running about 350 revolutions per minute, and the power is transmitted to the machinery by a belt.

At Hatfield, on the Marquis of Salisbury's estate, the River Lea is utilized to generate electricity, which is transmitted to the house and over the estate for a variety of purposes. Two turbines are used, one to drive a 40-horse power Siemens alternating current dynamo for lighting the house and the other to drive a 16-horse power Brush machine for arc lighting at night, and in the day for working the motors at the house and on the farm. Those at the house drive pumping and ice-making machinery, and a 24 inch Blackman air propeller fixed in the roof for ventilating. On the farm the motors are used for elevating hay and corn sheaves to the tops of the stacks for thrashing, for cutting rough grass with chaff-cutting machine, for ensilage in fields extending to a distance of two miles, for grinding corn, etc., to make fodder, and for other purposes. The motors have also been used for pile-driving, for making cofferdams where necessary in the river, and also for dredging the river and cleaning it of weeds.

LOCOMOTIVES AND CANALS.—It is supposed by many that railways and canals are irreconcilable antagonists. Recently, however, an experiment was made on the Shropshire Union canal at Worleston, Eng., by officials of the London & Northwestern Railway, which is suggestive of the lion lying down with the lamb. A set of rails was laid down on the canal bank for a distance of about a mile, and a small locomotive from the Crewe Railway Works was placed on the line. Two boats were attached by ropes to the locomotive, which drew them along easily at the rate of seven miles an hour. Four boats were then attached, and the same speed was attained. The locomotive worked very smoothly and the experiment is looked upon as a success.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK MINE.—*Amador Ledger*, July 7: Have extracted and milled 65 tons of ore from crosscut No. 2, drift from same crosscut driven 12 feet. Ore in face 8 feet wide. Mill has been closed down few hours on account of slackness of water. At present running steadily.

Calaveras.

A AND B MINE.—*Calaveras Chronicle*, July 7: We paid a visit to the A and B mine, owned by Messrs. Allen and Bishop and located near the head of Poorman's gulch, about two miles from here. Operations were commenced on this mine about a year ago. Water-power hoisting works were put up and an incline tunnel started. According to the survey the expectation is to reach the "channel" with an incline in the neighborhood of 1000 feet in length. The tunnel is now in about 800 feet, but a great flow of water has just been encountered which will require an additional amount of machinery to overcome it. At the present time about 900 gallons of water per hour are being drawn out. Mr. Arrowsmith, the superintendent, went below this week for pumping machinery which will be put in place as soon as possible. Further progress is impossible until pumps are put in.

CONTENTION MINING CO.—The Contention Gold Mining Co. was organized July 2, 1888, to operate in Mill Valley mining district. J. W. Meyer of this place is president of the company and Joshua Albright secretary and treasurer. There are eight shareholders. The company has 260 acres of placer ground in the above-named district. As far as prospected the gravel yields from eight to ten cents to the pan. They are down 65 feet on a portion of the claim, passing through 15 feet of gravel without yet reaching bedrock. The channel is traceable for two miles and a half and extends through the entire location.

El Dorado.

GOLD QUARTZ.—*Placerville Observer*, July 5: Chas. A. Gardner has opened a fine vein of gold-bearing quartz, in the old tunnel in Big canyon, on which some work was done four or five years ago by D. J. Knighton. Mr. Gardner was in town Saturday last and had some quartz taken from a pocket, that was literally alive with the precious metal.

VOLCANOVILLE.—*Georgetown Gazette*, July 7: This old mining camp lies in a northeasterly direction, by trail 8 miles, and 16 miles by wagon-road from Georgetown. The Josephine mine was first visited. We found Mr. Neugues absent. The 20-stamp mill is temporarily hung up, awaiting the setting up of the Triumph concentrators which will be ready in a few days, and the mill running. With the Triumph concentrators the Josephine mill will be the best equipped mill in the county and one of the best in the State for economic working of quartz. Several levels have been run in on the steep mountain-side, all in pay ore. The mine lies along the east side of the serpentine belt. The Cooley gravel mine, owned by Barklage, has been owned by Judge Edmondson and St. Clair Nye, for three years, price \$1000. This mine paid well in years past, but lay idle for a period. The present parties found that with a little capital and much hard work the pay channel could be reached with a new tunnel and drifted upon to good advantage, and receiving favorable terms from Mr. Barklage, they entered into the work last winter. They expect to cut into the channel some time this summer. A mile to the southeast is the Last Chance claim worked by Richard Collett, Chas. Kane and Merrick Creigh. They have a tunnel and shaft with 100 feet face. The lode averages about four feet, between blue slate and porphyry. It is thought the rock will mill \$6 or \$7 per ton. They are getting ready to put up a three-stamp mill (the old Potter mill), and expect to begin crushing in a few weeks. D. C. Webster and C. F. Lloyd are drifting in their claims on the Ross channel. Immense deposits of material, supposed to be of volcanic origin, covers much of the country about the old camp, as it does about Mr. Gregory and other portions of the upper divide. This deposit often reaches a depth into hundreds of feet. Beneath these great deposits of material exist remnants of the bed of an ancient river. Considerable wealth has been mined from accessible places beneath this deposit in years gone by, but of late years little has been accomplished, owing to the want of capital and good engineering skill.

Inyo.

SODA.—*Inyo Independent*, July 7: Mr. T. H. Flagler has been at Keeler for some weeks past putting up a windmill and pump. The machinery pumps water from the lake into ground tanks, and has a capacity of 500 gallons per minute with a moderate breeze. The water evaporates quickly from the tanks and the soda that remains is then easily gathered. The windmill method of pumping is much cheaper than steam-power, and the latter will likely be dispensed with as the former is proved successful. These windmills are cheap and quite reliable to furnish all the power required.

Fresno.

FRESNO FLATS.—*Expositor*, July 4: Mr. Taylor, from Fresno Flats, reports wonderful activity in that mining district. The Surprise mill is running with a force of 50 men. The Grub Gulch mine is in a flourishing condition and paying well. A new 20-stamp mill is now in course of construction. The Crystal Springs, a new mine, is expected to pan out well. A road is already being built to it, and a mill is in contemplation. The Nob Hill and Gambetta mines are also in a flourishing condition, and are paying well. There will be four mills running during the present season.

COPPER.—*Cor. Fresno Expositor*, July 4: Prospects in this district are still active. A vein of fine-looking copper ore has been struck on Kings river by the McDowell Bros., which not only carries a great deal of copper but considerable silver. The Peterson Bros. have crushed several tons of rock from their Valley Vein mine which has paid them handsomely. In their tunnel the vein is about a foot in width, and they have run about 30 feet into this chute and it looks no more like giving out than when

they first struck it. This is the same chute which they have in the bottom of their lower shaft, and which has continued down from the grass roots, so that now they have over 125 feet of backs which they can stope out. Messrs. Ninnis, Jensen & Fritch appear just as happy as the Peterson Bros., for their copper prospect has turned out even better than they anticipated. They have a large pile of first-class ore on their dump. Messrs. Hutchison & Sharp have quite an amount of ore which is now being shipped or about to be. Their vein is now about four feet in width, and their ore assays as high as 70 per cent. Messrs. Wyatt & Co. are still working their Fancher creek mine.

Mono.

DIANA MILL BURNED.—*Inyo Register*, July 5: Benton suffered a loss last Saturday night in the total destruction of the Diana mill. The fire, when first discovered, was a small patch of blaze, but by the time the townspeople could reach the scene the entire roof was on fire. It is supposed that a spark from the engine, which had been running till some time that evening, had caught in the shingles and burned slowly for some hours, at last attaining dangerous size. Jno. F. Millner, the owner, says \$20,000 would not compensate for the loss, which is all the heavier because the mill was just now making a very profitable run. A quantity of rich pulp awaiting further work was almost all lost in the ashes. The insurance on the property was light, not above \$5000 at the most. We are told that there is a possibility of rebuilding. The disaster will be a severe one for Benton.

Nevada.

THE NEVERSWEAT.—*Nevada City Herald*, July 7: The owners of the Neversweat mine are liable to wake up this section by showing a mine of great value. The shaft is down 300 feet. Three years ago the company started a tunnel to strike the shaft at that depth. They have got in 1600 feet, and will be under the shaft some time this week. The tunnel was run on the line of the ledge. The width of the ledge in the bottom of the tunnel is now two feet. A crushing was made last month from the rock taken out while running the tunnel. Part of it was sent to the Selby Smelting Works, San Francisco, and part worked by mill process here. That sent to San Francisco yielded \$200 per ton. That crushed here yielded about \$80 in free gold, exclusive of the sulphurets. The mine will be worked by water-power, which is obtained from Slate creek. They use an 8-foot hurdy-gurdy wheel and double nozzles. Not much water is required for power.

NORTH STAR MINE DIVIDEND.—*Grass Valley Union*, July 7: The North Star Mining Co. has declared its first dividend, payable on the 11th inst., of 50 cents per share on the capital stock of the corporation, which amounts to \$50,000 on the 100,000 shares. This is a good dividend, and no doubt it is the forerunner of others, as the mine is understood to be producing profitably. This is encouraging for a mine that was permitted to lie idle for years upon the theory that its wealth was exhausted.

Placer.

MINING SITUATION.—*Herald*, July 7: In the mining sections a great deal of work has been done in opening mines and preparing for further development. Sufficient time has not yet elapsed to determine the channels, but the prospects show that before the present season shall have ended several new and paying mines will be in operation. Quite a list of mines on the Forest Hill Divide have been purchased by San Francisco capitalists who are preparing to operate them as soon as men and machinery can be set to work. Thus the whole country is doing well, and no one except the hydraulic miner has any reason to complain or growl. He has a right to complain, and should keep up his fight until the Government assists him to work his claim unmolested by spies or sheriffs.

Plumas.

PAYING.—*Plumas National*, July 7: The Lucky "S" quartz mine, under the management of Uncle John Hardgrave, is paying \$25 per ton. Chatty & Bro., in Granite basin, are working \$60 rock. The ledge is about one foot thick.

San Diego.

PACIFIC MINING DISTRICT.—*San Diego Union*, July 7: The Pacific mining district is highly spoken of by T. Ramsdell, the mining expert who has just returned from a visit to the mines. Only development is necessary, he says, to produce an immense output of mineral gold and silver. The mines will, he says, finally be classed as silver and are exceedingly rich. The mineral development alone, he says, will demand the completion of the Cuyamaca railroad, and with reduction works at San Diego, will be a great source of wealth to the city.

Shasta.

GOLD BARS.—*Redding Free Press*, July 7: The gold product from the Squaw creek mines still enriches the world. We learn that Joe Josephs brought in from the Riley and Bliss mine on Monday last, \$4000; and Jack Conant, from the Uncle Sam mine, about \$5000. Jack took half of this to San Francisco with him.

IRON MOUNTAIN SILVER.—Sixteen silver bricks from the mine at Iron Mountain were shipped from Redding Thursday to the Selby Smelting Works. These bricks average \$1000 apiece, making \$16,000 in silver.

Sierra.

NEW FIND.—*Sierra Tribune*, July 7: Frank Cook brought a batch of fine rock down from Hog canyon the other day. It was taken from a new find.

SOON TO ARRIVE.—*Nevada Transcript*, July 7: The 40-stamp mill to be put up on the Red Chief quartz mine on Kanaka creek, Sierra county, will probably arrive here next week, and will be transported by wagon as rapidly as possible to the claim. The Red Chief Co. appears to have a long purse behind it.

Siskiyou.

STEAMBOAT CLAIM.—*Yreka Journal*, July 11: The Fort Jones Gravel M. Co., now working the old Steamboat claim, near mouth of McAdams creek, cleaned up a few days since from the gravel washed during reopening of claim, and realized 20 ounces.

Trinity.

EAST FORK.—*Journal*, July 7: Capt. Weaver, superintendent of the Golden Chest, has 30 mules on the trail between North Fork and East Fork

packing the machinery for the above-named mine. He will have the work of packing completed in a few days, when the construction of the mill will be begun in earnest and pushed to completion as early as possible. It will probably be several months before any bullion will be shipped from the mill. Several locations have been made during the past month, and some of them show very flattering prospects.

DEADWOOD.—Jo. Falan is working on the old Willey mine and is taking out very rich rock. Geo. Klein has two locations on Deadwood and is getting good prospects on the North Pole location in two places. The latest discovery was in the tunnel just above the mill, and looks well; he is now sinking on the ledge. The other prospect on the North Pole yielded \$60 to the ton from 7 tons crushed. Mr. E. B. Lamb has run the tunnel on the Red Diamond mine in about 60 feet, and has struck the ledge which he is now following. The vein is 30 inches wide and looks well; the quartz carries free gold and the sulphurets are rich. Mr. Lamb's location is on the north side of Deadwood creek and contains three ledges; the other two prospect better in free gold than the Red Diamond, but are smaller ledges. The ledge of the Red Diamond is well defined and lies between porphyry walls.

A GOOD CLEANUP.—*Journal*, July 7: Mr. W. J. Leavitt came in from East Fork Tuesday, with \$2600 worth of bullion as a result of a cleanup from 27 tons of ore from the Enterprise mine. The quartz of the Enterprise is very uniform, averaging \$100 to the ton, since the present owners have taken charge of the mine.

DID WELL.—The Segalia placer mine on Red Hill has made an exceedingly good cleanup. The parties interested were happily disappointed by obtaining much more than they anticipated. They were put to a heavy expense in putting a suspension bridge across Trinity river last summer and many experienced miners talked discouragingly concerning the affair. Nearly all the debts incurred in consequence of bringing the water into the mine will be paid off this season, and if a fair run is secured for next season there will be a surplus for the owners.

Tuolumne.

EXPERIMENTAL.—*Tuolumne Independent*, July 7: The Experimental mine made a cleanup last week, and as a result a nice brick was obtained. The run was 26 days, yielding the boys very fair wages. Many disadvantages and drawbacks hindered the operations. These will be overcome next time. The company is composed of Messrs. L. A. and John Engelke, J. P. Conlin, Henry Dunn, Geo. Stayton and Geo. Bonifoy.

CLOSED DOWN.—The Buchanan mine closed down last Saturday. About 60 men were discharged. No definite reason for this sudden stoppage of work is given, but rumors of "Fourth of July, sale of half interest, change of management, rock don't pay, etc., etc." continue to circulate. This was the largest, and gave employment to more men than any mine in the county. It was supposed to be in a thoroughly prosperous condition, had formed quite a town around it, and the closing down was a surprise to every one.

QUARTZ.—*Sonora Democrat*, July 7: It is said that a recent crushing of rock from the lower levels of the Patterson mine yielded handsomely. Messrs. Gillis & Rice of Tuttle town are taking out considerable gold right along in their pocket mines on Jackass Hill.

STRUCK IT.—Messrs. Louis Page and David Oliver have struck it big in the Old Fuchs claim above Saw-Mill Flat. We do not know the exact amount, but it certainly will reach well up in the thousands. The bonanza came in during the early part of this week, and at last reports the gold was still coming out in large quantities. As much as \$4000 was taken out in two days. It will be remembered that this is the claim on which Louis Page erected hoisting works last winter. Even under adverse conditions he worked away with strong hope and much energy. The considerable depth of the lowest workings (on which the pockets are now found), the terrible caving condition of the walls, and the large quantity of water to contend with did not discourage him. Success came at last. His partner, David Oliver, seems to be attended by fortune wherever he goes. No one in this county has been so singularly fortunate.

CEMENT AND GRAVEL.—Messrs. C. C. Gurnee and others have purchased a cement and gravel mine $1\frac{1}{4}$ miles above Byrne's ferry on the Stanislaus river. The name of the Stanislaus Tunnel and Mining Co. has been adopted and big works will shortly be commenced. From Mr. Frank McCann, one of the parties, we learn that it is proposed to erect a quartz-mill and several mammoth rock-breakers, the latter being intended to crush the cement and gravel very fine preparatory to going into the mill. Thus by the larger part of the reduction work being performed by the rock-breakers it is estimated that about five tons of material to the stamp can be crushed. The works will have a capacity of at least 100 tons per 24 hours. The claim embraces 480 acres. Initial operations will be commenced 300 feet above the bed of the river at a spot which physically and in valuation is the key to the entire channel. Mr. McCann states that the entire cost of mining and milling the material will not exceed \$7 per ton.

NEVADA.

Washoe District.

IOWA.—*Virginia Enterprise*, July 7: East drift face is in vein porphyry and clay with some quartz.

CON. IMPERIAL.—Are still engaged in repairing the main north lateral drift.

KEYES.—Good prospects are still being obtained in the exploring drift on the 280 level.

BENTON.—Are making fair headway in the drift that is being run north on the 725 level.

OVERMAN.—About 280 tons of ore a week are being extracted from drifts on the old upper levels.

ANDES.—The winze that is being put down below the 240 level is still in quartz of promising appearance.

OPHIR.—No. 2 upraise is up 102 feet above the track floor. It shows no important changes of material.

SAVAGE.—Are stopeing ore from the north and south drifts on the 400 level, also from the south drift on the 500 level. About 80 tons of ore per day are being mined at points between the 400 and 900 lev-

els. The pulp assays average \$20 a ton. The amount of bullion on hand and heretofore shipped for the month of June amounts to \$34,550.

MEXICAN.—East crosscut No. 1 from the main north drift is out 172 feet and continues in vein porphyry.

SEGREGATE BELCHER.—Good progress is making in the east drift which is to connect with the Overman winze.

ALTA.—The ore-producing sections are looking about as usual, and the mill and concentrators are steadily at work.

CONFIDENCE.—The daily shipments of ore to the Brunswick mill average 182 tons, and the battery assays average \$28 per ton.

UTAH.—On the 372 level opposite the south drift a north drift is advanced 160 feet. The formation is vein porphyry and quartz.

POTOSI.—The stope joint with the Chollar are yielding the usual quantity and quality of ore, which is being worked at the Nevada water-mill.

SCORPIO.—The south drift on the 300 level has now a total length of 370 feet. The formation is about the same as at date of former report.

BEST AND BELCHER.—El Dorado Tunnel: North-west drift from main west drift advanced 32 feet; total, 368 feet. The face is in porphyry.

LADY WASHINGTON.—The crosscuts from the upraise at points above the 725 level are in a promising formation of quartz, clay and porphyry.

WEST CON. VA. & CAL.—The new hoisting machinery is working well and smoothly, and good headway is making in sinking the main shaft.

UNION CON.—The north drift from west crosscut No. 2, on the 1300 level, is out 93 feet, and the south drift started from the same is out 32 feet.

BULLION.—The south drift from the bottom of the winze on the 640 level is making favorable progress. There is no change of material worthy of note.

SIERRA NEVADA.—On the 520 level the south-west drift is out 1769 feet. Its face is in a mixture of quartz, clay and porphyry. It still shows some water.

YELLOW JACKET.—The daily ore shipments average 90 tons. The stope continues to look well. A good deal of prospecting work is in progress at several points.

CHALLENGE CON.—On the 1000 level the north-east crosscut is out 33 feet. The face continues in vein material. Good headway is being made with all repair work.

WEST YELLOW JACKET.—A large belt of rock has been encountered in the face of the drift, but it appears to be a mere rib, and will probably be passed through in a few days.

ALPHA.—Explorations are still continued on 222 and 382 levels, and good headway is making in sinking the main shaft, which will be put down to the 500 level before drifting.

BALTIMORE.—Some good ore is being cut into on the 300 level west, and the outlook is good for finding a large body that will pay for milling. The pumps are now doing good work.

BELCHER.—All is now nearly in readiness for starting up the hoisting works recently erected at the old shaft. The starting up of these works will greatly facilitate all underground operations.

CROWN POINT.—On the 600 level the raise is still showing streaks of ore of good grade. On the 700 level the southeast drift is out 45 feet, and the east crosscut started from the end of it is being pushed ahead in promising vein material.

CHOLLAR.—The mine is looking well in all the ore-producing sections, and the usual amount of ore is being reduced at the Nevada mills. The station at the foot of the main incline on the Suro tunnel level is about completed, and ready for the timbering.

GOULO AND CURRY.—From the 250 and 300 levels extracted and shipped to the Douglass mill 105 tons of ore during the week, battery samples of which show an average assay value of \$30.30 per ton. West crosscut No. 2, started from the main south-west drift, has been advanced 33 feet. The formation is quartz and clay. There have been worked at the Douglass mill during the month of June 1000 tons of ore, which yielded \$16,026 in bullion.

OCCIDENTAL.—Shipped to the Atlanta mill during the week 113 tons of ore, and to the Excelsior mill 26 tons. The former showed a value of \$23 per ton and the latter the same per ton, from assays made from wagon samples. Worked during the month of June at the Atlanta mill 465 tons of ore, which yielded \$5903.16. Worked at the Excelsior mill during the same month 300 tons of ore, the bullion yielded by which is now at the assay office in Virginia City.

HALE AND NORCROSS.—During the past week there were hoisted 1819 tons of ore from the 600 and 700 levels, and shipped to the Mexican mill 1100 tons, and to the Nevada mill 525 tons. All the ore-producing sections of the mine continue to look well. The extraction of ore from the west upraise will be resumed next week. On the 400 level No. 1 east crosscut has been extended 36 feet. There is on hand and heretofore shipped bullion for account of June amounting to \$150,000. Full returns from the mills for June account have not yet been received.

CON. CAL. & VA.—On the 1465 level the ore-producing sections continue to look well, and are yielding the usual quantity of ore. The east crosscut from the top of the north upraise on the 1500 level is still in ore of good quality. The north drift from the north stope at the north end of the main north drift is still in quartz that shows value by assay. The ore stops on the 1600 level are still looking and yielding well. The south drift from the Ophir east crosscut is out 60 feet in Con. Virginia ground. The usual amount of ore will be shipped to the river mills during the week.

Aurora District.

GOOD INDICATIONS.—*Esmeralda News*, July 7: M. Carabantes has been working on the Consolidated No. 2, of which he is the owner. He has a tunnel in 33 feet, with good indications of striking the ledge. He expects that when the tunnel is in eight feet further the ledge will be exposed.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, July 7: The following number of tons of ore were shipped from the mines of the district to the furnaces during the week:

Silver Lick mine, 34 tons; Dunderberg, 42½ tons; White Pine, 5½ tons; Geddes & Bertrand, 12½ tons; Bob Waters, ½ ton; El Dorado, 3½ tons; West End, 6½ tons; Marston Farrel, 2½ tons, and the Needle, 3 tons. From Woodchopper, 9½ tons, and Leonie, 3 tons.

Bristol District.

COPPER.—Pioche Record, July 3: Two tons of copper bullion were brought in from Bristol, Wednesday, for shipment to Salt Lake. It is a part of the product of the recent short run of the small furnace there.

Moss District.

BLACK PRINCE.—Esmeralda News, July 7: The Black Prince mine is about 3½ miles from Kinkead. We are informed that there are 300 tons of copper ore on the dump and that three men are kept busily engaged extracting more. There is an eight-foot ledge of copper ore in the Black Prince, average assays of which give 22 per cent. This mine is further developed than any mine in Moss district, and is owned by Knapp, Laws & Warner.

Ophir Canyon District.

MILL RUNNING.—Belmont Courier, July 7: R. H. Robinson of Ophir reports his gold-mill running steadily and doing good work.

Osceola District.

THE PLACERS.—Virginia Enterprise, July 7: These mines, situated on the west side of Mount Wheeler, White Pine county, are to be thoroughly worked. They cover a large area, and water is to be brought to them at a cost of \$120,000. The supply of water will be 2600 inches for seven months each year. All parts of the ground have been prospected by shafts and by actual workings. In all, over \$40,000 have been taken from these placers, much of which was in large nuggets. Heretofore the great trouble attendant upon the working of these placers has been lack of water. In the mountain slopes, on which these placers are situated, are doubtless immensely rich quartz veins, which will probably be found when the placer ground comes to be washed over by hydraulic process.

Pioche District.

STOPPED WORK.—Pioche Record, July 3: It is found that the Yuba ore does not contain a sufficient per cent of lead to admit of its being successfully concentrated, and yesterday the vanning machines were shut down. A good portion of the silver in the ore is contained in gangue so light that it floats over the tables and is lost in the tailings. The vanning machines erected for the purpose of concentrating the ore work well, and successfully concentrate the old tailings now at the mill, though the percentage of lead contained in them is small. Arrangements will probably be made by which all the old pit will be worked over.

Seligman District.

THE CONCENTRATING WORKS.—Eureka Sentinel, July 7: S. R. Krom, the New York inventor and owner of the Krom Machine Works, returned here from Seligman last Wednesday morning, having completed some important alterations in the concentrating works at that place. It appears that the original plans of the mill were not followed, and these alterations therefore became necessary. Mr. Krom thinks that there will be no trouble about the mill doing its work effectively after this, and expects shortly to receive orders from Eugene N. Robinson for nine additional concentrators, the machinery of the mill being adapted to the requirements of 18, nine of which are already kept working to their full capacity. Recent work and developments have shown that the ore in the Pursell series of mines is practically inexhaustible, and while no one has even attempted to show that the ore is very rich, there is no reason why it should not improve in quality, as we learn that it does, as depth is attained. From Mr. Krom we learn that Mr. Robinson contemplates erecting smelters at Seligman for the reduction of the concentrates near the mill, but this will depend necessarily on their chemical contents and the facilities for obtaining the requisite fluxes on the spot.

Taylor District.

ARGUS.—White Pine News, July 7: Better ore is being encountered in the lower levels of the Argus mine and the force is being increased as necessity demands.

Tybo District.

PRODUCING ORE.—Belmont Courier, July 7: Hank Metz informs us that the Ma Alta mine, Tybo, is looking well and producing good ore. In fact as developments progress the mine looks better and better. The first-class ore is shipped to Salt Lake for treatment, and the second-class is sold to the Nye Mining Co. of Tybo. Mr. Metz thinks that Tybo is on the eve of prosperous and busy times. N. S. Trowbridge is now working successfully ores that contain 15 ounces of silver to the ton, and netting a satisfactory profit for the Nye Mining Co. Custom ores are worked in this mill and the chlorides of Tybo and contiguous camps need not ship their ores for treatment away from home.

Tuscarora District.

GRAND PRIZE MILL.—Times-Review, July 6: All is now activity at the Grand Prize mill. Preparations are being made for a lengthy run on the ore left in the slopes last winter, and the new ore development recently made on the 200-foot level which daily increases in size and richness as the drifts are extended. The mill is being put in working order as rapidly as possible and fuel and other supplies are accumulating.

NAVAJO QUEEN.—Fair progress is being made in the northeast drift, 200-foot level.

FOUND TREASURE.—Some high-grade ore is being taken out. Water continues to decrease.

NORTH BELLE ISLE.—The mine from the 300-foot level has been connected with the 400-foot level, materially improving the ventilation.

NORTH COMMONWEALTH.—North drift from west crosscut on the first level has been extended 25 feet. The vein is looking very favorable, yielding some high-grade ore. The south drift has been extended 16 feet. The vein is about two feet wide, but the ore is not as good as in the north drift.

NEVADA QUEEN.—On the 350-foot level the stopes have been extended both north and south, improving both ways, and are looking well the entire distance. Very fine ore is being extracted 130 feet above, where the chute from the 200-foot level is being straightened. The vein is large and high grade. The 400-foot level of North Belle Isle is very close to the line, and very high-grade ore in the

face. They will reach the line within a week, after which the Queen will continue the work. It is a fine development and has every appearance of being the continuation of the ore body opened on the 350-foot level. Average car samples for the week, \$232 per ton. Repairs on the mill will be finished by Sunday, the 8th instant.

COMMONWEALTH.—Work has been resumed in No. 1 north drift to open up the ore body cut in the shaft, which has been followed north about 90 feet, and is extremely rich ore. East drift, south of the shaft, has been connected with the main south drift, 150-foot level, by a crosscut, making the ventilation first-rate. Have resumed work on the ore going east, which is looking well. Average assay (car samples) of ore hoisted, \$619 per ton.

ALASKA.

PLATINUM.—Juneau Mining Record, June 30: Glacier Bay district is attracting some attention and several good claims have been located. Messrs. Summers & Van Brocklin have about 25 tons of ore on their dump, some of which it is said will assay nearly \$400 to the ton. It is said that miners in the Yukon country, while working the placers, find large quantities of platinum, which they throw away, believing it to be of no value. This is a great oversight, as that metal has quite a commercial value.

ARIZONA.

VARIOUS MINING CAMPS.—Journal-Miner, July 4: The Old Reliable, in Bradshaw district, maintains the title to its name. The Last Chance, in the Bradshaw mountains, is said to show up for the amount of development as well as any claim in the county. Philip Richardson, from the Congress, says the main shaft is now down over 400 feet, the ore body being continuous the entire distance. The second shaft is also down now over 200 feet with good ore all the way. John Curtin and Nelson Gable have made good progress in running the tunnel on the Lion mine, in Maple gulch, and are in exceedingly good ore. The ore body is increasing in size as well as in richness as progress is made in the work. Walter Wright was in town yesterday with 49 ounces of gold bullion which he had extracted in the Del Pasco mill from rock from the Wild Pigeon mine. He says that the mining outlook was never so bright for the Bradshaw country as at present. All the claims which are being worked are looking well. Brann & Mitchell have over 400 tons of good ore on the dump of the Veteran mine and have started up the Wonder mill crushing it.

COLORADO.

NOTES.—Denver Republican, July 7: Work has been resumed on the Iron Mask mine at Red Cliff. The Republican mountain mines at Georgetown are increasing their output. Some good ore has been found near Pitkin, on the north side of Hall's gulch, in a well-defined contact.

SAN MIGUEL.—Journal, July 7: Owners of prospects on Bear creek now have an opportunity to test their ores at the Cropsy mill. Frank Mauney and French Joe made a new discovery on Mill creek this week that bids fair to develop into something unusually good. Another tunnel to cut the Sheridan mine 500 feet lower down than the one now being run was surveyed and started this week. The Silver Bell at Ophir is making regular shipments and is showing better than ever before. The Gold Chicken mill is now running full blast under the supervision of John Flood. The mine is at present working a small force.

DAKOTA.

REDUCTION WORKS.—Deadwood Pioneer, July 4: It is with genuine pleasure that we are at length able to make the announcement that the first active step has been taken toward preparing the grounds for the erection of the Deadwood Reduction Works company's leaching plant. Surveys and maps have been completed by Engineer Thos. H. White, and yesterday a force was taken to the site and started at work on trenches, ditches and other excavations necessary to be made before the building is erected. Plans and specifications are looked for from Mr. Clark. At once these are received, so that the directory will be enabled to intelligently proceed with execution of the plans, a larger force will be employed and work on the building begun.

IDAHO.

GOOD FOR THE SCHOOLBOY.—Wood River Times, July 7: A four-ton lot of first class ore was brought down from the Schoolboy claim, in Croly gulch, this week, and sampled and sold. It carried 82½ ounces silver and 62½ per cent lead, and netted the owners about \$100 per ton. This was only a sample lot. Now that they know its value, the owners will extract more ore.

THE BUTTERCUP A MINE.—Very encouraging reports come from the Buttercup claim—a somewhat recent location owned by McFarland & Sutherland, and situated about four miles north of Clarke's station, at the upper crossing of Willow creek. This claim, it is stated, is showing a huge vein of first and second-class ore, and a tunnel driven in depth has demonstrated the existence of a high of over 200 feet of solid galena, and a width of about 18 inches of first-class, and from one to three feet of second-class ore. The property is already spoken of as one of the best shown up on Wood river, and as being second only to the Minnie Moore.

A GENERAL SAMPLE FROM THE LEAD BELT.—About 2½ tons of ore were brought in yesterday from the lead belt near Era—the same being one-half of a general sample made up from their properties by the mine-owners in the vicinity. The other half of the sample lot will be received in about one week. When received the whole will be sampled, and if the returns are remunerative shipments will be made from several mines there.

LOWER CALIFORNIA.

RICH ROCK.—Pasadena Union, July 7: Frank Voight, who returned Saturday from Ensenada, Lower California, brought some very rich gold rock from that section into the Union office this morning.

The rock showed considerable free gold and will probably run \$400 or \$500 a ton. He also exhibited a gold button which had been taken from a quantity of the rock.

MONTANA.

PROSPECTS.—Anaconda Review, June 29: A trip up Foster creek reveals some very fine prospects. The Ontario, which Messrs. Davidson and Sawtelle have bonded to Edwards & Barker is looming up. They are sacking some beautiful carbonate ore. Just above the dam we find a group of cabins, one of which is owned by Mr. Canovan. John has a good miner working with him and they are sinking an incline on their claim. They will probably send a carload of ore out some time this summer. Messrs. Young and Churches have a fine vein of fire clay near by, which we learn stands as high a test as anything in the country. Mr. Young is working on a claim from which he is sacking a little ore daily. It is high grade (200 ounces), but the pay streak is small, although it gives good indications of widening. At the next cabin the owners of the ranch, Messrs. John Cadle and Ben Caspar, are working on the Casius Bennington ledge and piling up some 150-ounce ore. They have several more flat ring prospects up here, probably the next best of which is the E. L. K., from which they have sacked considerable 500-ounce ore, but the pay streak is narrow and the headway is small. The formation here is mostly lime although the lime capping is shallow, as granite is plainly seen at most anywhere at the creek level. The boys have some claims located further up which are in granite on both sides and which show good ore at the surface. The general impression one gives of this section is a most favorable one, and there is no doubt but the head of Foster will be heard from soon in a manner not to be forgotten. Good reports continue to come to us from Olsen's River View, in Olsen gulch, in which a rich strike was recently made.

RICH NEW QUARTZ DISTRICT.—Helena Mining Review, July 6: There is no longer any reason to doubt the richness or the vast extent of the ores lately discovered on Cold Spring creek, 20 miles south of Horse Plains, Montana. Several specimens from various claims there would indicate wealth for their owners. It is believed by experts that these leads are the ones from which came the placer gold that was taken out on Quartz and Cedar creeks, in such vast quantities, 20 years ago. Several shafts are now down 20 to 100 feet and the ledges grow richer in the precious metals as the work progresses. Capitalists from Helena, Butte, Anaconda, Portland and the East have been attracted to these new mines, and after making personal inspection of the claims have made several heavy investments. E. M. Parks, an old prospector of Missouri county, one of the first on the ground, located a good slice of the gold quartz, and a few days ago sold a one-third interest in it to a Portland syndicate for \$30,000 cash. He asks an equal sum for another third, and says the remaining interest remains with him to comfort his declining years. Colonel Geo. W. Irwin of Butte and E. B. Taylor of Anaconda lately spent several days there, pronounced the indications the best they had seen in years, and are reported to have secured some important options. This district has been but sparsely prospected and there is doubtless a rich field here for expert prospectors. A great many of them are going in from Horse Plains, realizing the fact that this is the nearest and most practical railroad point at which to outfit and from which to start. There is a good ferry there and one of the best mountain trails in the West runs direct to the mines. Fifteen men have been at work for two weeks past clearing out the old Adams trail, over which parties can now ride into the heart of the new diggings in five hours.

NEW MEXICO.

MALONE.—Southwest Sentinel, July 7: Several men are employed on the Young Man mine near Malone, all being engaged in development work. The directors of the company are expected daily, and on their arrival will make a thorough inspection of the property, and it is rumored that a full force of miners will be employed and the mine opened in first-class manner.

LAKE VALLEY.—Silver City Enterprise, July 7: The Silver Mining Co. of Lake Valley, successor to the Sierra Grande Mining Co., has paid a five per cent dividend, and will probably pay another of the same amount, after which it will still have \$50,000 in its treasury. Good, that! Hon. John Bragaw from Georgetown says that T. B. Pheby is taking out more ore than was ever taken out at Georgetown, and will start the mill again in a few days. He has about 40 men at work. Work was resumed on the Grand Tower of Gold Hill, by Lewis & Cottrell, four weeks ago. In dressing up the mine an 18-inch vein of \$175 ore was discovered on the hanging-wall which is now being taken out, and will probably be shipped to the Flagler works of this city for treatment.

COONEY CAMP.—A big strike in the Oakland mine. Not long ago Mr. Huson came from Denver and opened up this mine, taking from or near the surface a carload of ore and shipped it to Denver, which netted him a nice little profit, since which time he has been sinking on the vein and is now down 50 feet. About a week ago the vein commenced widening and growing richer. Now it will require crosscutting to ascertain the width. The shaft is 57 feet and is in solid quartz with two pay streaks of high-grade ore, one 16 inches wide and the other four inches, that will run from \$200 to \$500 per ton; the balance is good milling ore that will run from \$20 to \$80 per ton. There is on the dump from 200 to 300 tons of ore that will average \$50 for milling, and two-thirds of its value is gold.

GOLD HILL.—Silver City Sentinel, July 7: The increased activity in mining circles has been the means of centering and directing attention to Gold Hill, the most promising gold-bearing ore in the Burro mountains. The first discoveries were made in 1884, and attracted considerable attention in mining circles. The year following these, the first locations, little was accomplished aside from the annual assessment, but enough was ascertained to prove to the most skeptical that the new camp was infinitely better than the surface croppings indicated. The Indian troubles of 1885 in a great measure retarded development, and it is a well-established fact that negotiations for properties in the Gold Hill dis-

trict were suspended, because of the unsettled condition of the country as they related to Indian affairs. The miner and prospector, notwithstanding the risks to life and limb, pursued his calling, and to-day is the proud possessor of mining claims which are destined in several instances to yield him fortunes. The Standard mill is running full time; and the results obtained under the management of Mr. Coleman are very flattering. A run of 48 hours, followed by a partial cleanup only, gave a return of \$1800 in gold. The Grand Tower, the property of Lewis & Cottrell, is rapidly taking a leading position among the coming silver mines of the country.

OREGON.

LA BELLEVUE.—Bedrock Democrat, July 4: The Democrat reporter had the pleasure yesterday of conversing with J. B. Cabell, one of the owners of the La Bellevue mine on Onion creek, this county. In regard to his mining property, the La Bellevue, Mr. Cabell said: "We now have a tunnel in on the ore vein 450 feet, at which point the ledge is 11 feet in width between walls, and the ore will average \$50 per ton throughout. In depth on the ledge we are 250 feet, and can tap the ore body 1500 feet below the surface by driving a tunnel low down on the mountain. We are now taking out ore which we will ship to Denver for reduction. Fifteen tons are now in this city ready for the cars, and 30 tons more will be here as soon as teams can deliver it. The ore we ship works from \$250 to \$500 per ton, and we are now taking out some ore that will go \$3000. We employ eight men constantly, and will most likely put up a concentrator and work about 20 men before winter comes on." The La Bellevue has more than paid expenses of development from the start, and cannot now be purchased of its owners for less than a quarter of a million dollars. Such mines as the La Bellevue, Eureka, Excelsior, Columbia, Herculean, Gray Eagle, California, and a dozen other well-known bonanzas, will bring a mining boom in the near future.

BAKER CO. MINES.—Bedrock Democrat, June 29: Dr. Thibode, of this city, who had just returned from a visit to Cracker creek district, favored the Democrat reporter with the following notes: The La Bellevue, owned and operated by the Cabell Bros., the Dr. pronounces one among the finest ore producers that he has ever seen. The mine proper has an elevation of 7340 feet above sea level. Observations taken on the south side show a tunnel 700 feet long; vertical depth 225 feet. The ore body is 450 feet in length with an average width of 4 feet. Crosscut at the face shows 10 feet of ore and no foot wall. The hanging wall is porphyry; foot wall gneiss; 150 feet of hanging wall is almost perpendicular and foot wall nearly flat. On north side, tunnel on ledge is in 175 feet, winze 55 feet from level; ore between walls, 4 feet; pay ore, 2 feet; distance between tunnels, 1000 feet. On this side the ledge can be tapped at the depth of 1500 feet. There is on the dump 100 tons of shipping ore, averaging from \$350 to \$400, and from 700 to 800 tons of ore averaging between \$75 and \$150. The Wide West, owned by Messrs. Flaherty, Lucas and Garrison, is another property that bids fair to some day create a stir in mining circles. Tunnel, 500 feet; crosscut, 350 feet; vertical depth, 140 feet below upper tunnel. Upper tunnel is 100 feet long; crosscut, 80 feet; vertical depth, 80 feet; ledge in upper tunnel, 4 to 5 feet; lower tunnel, 5 to 6 feet; can be tapped 500 feet deeper by tunnel.

BAKER COUNTY MINES.—Bedrock Democrat, July 7: It is again gratifying to us to be able to note the rapid strides made in the development of mines and sales made in Baker county. Our county records to-day show the fact that another great mining sale has been consummated. Messrs. Henry and Erwin Cable yesterday transferred the first extension south of the great Eureka and Excelsior mines on Cracker creek, known as the Columbia, to an Eastern syndicate for a handsome figure. This mine was bonded on the 28th day of May by H. Stevenson of Salt Lake City, who has succeeded in selling it to men who, ere long, will have a mill on the mine turning out gold bars. Mr. J. E. Meacham of Caldwell, Idaho, an old-time mining superintendent, has taken charge of the mine as foreman, and will push the work vigorously for his company. The Cable Bros. have been working mines in Baker county for the last 15 years, and are experienced miners. They also own the great California mine, in the Cable Cove, which they now expect to develop, and are perfectly assured that they can make as large a mine of this as there is in the State. They now have 1000 feet of tunnel on the mine, exposing the ore vein in three places from which they have shipped rich ore to Denver and San Francisco, and have made considerable money in this way. There is also some rich placer ground in the district which has been located.

UTAH.

REVIEW.—Salt Lake Tribune, July 7: The week has seen the close of the half-year with a rather diminished metal production. The receipts in this city of bullion, excluding all ores, for the six months past were as follows, as per current reports: January, \$327,141.43; February, \$285,687.79; March, \$283,203.98; April, \$224,019.60; May, \$385,735.14; June, \$333,899.42; total, \$1,839,747.36. Several operations which make no current reports are necessarily not carried in the above. The slight rise in the price of lead has continued to help throughout the week, and the receipts of ore have been good. For the week ending July 4th, inclusive (really the 3d, the 4th being a holiday), five days, the receipts of ore were to the value of \$61,236.49; of bullion, \$93,497.23; total, \$154,733.72. For the previous week the receipts were \$199,654.18, of which \$103,217.27 was bullion and \$96,436.91 was ore. The Ontario product for the week was \$20,568.47 from ore sales, and of bullion 7835.12 fine ounces. For June the Ontario product was \$77,614.85 from ore sales, and of bullion, 104,977.39 fine ounces. The Daly output for the week was of bullion, 14,285.94 fine ounces of bullion and \$7688.92 from ore sales. Fine bar receipts for the week were to the value of \$52,760.30; gold bars, \$335.03; base bullion, \$17,050. The product of the Hanauer smelter for the week was \$11,180 in bullion; of the Germania, \$9155.82. Ore receipts in this city for the week were \$41,580.85 by Wells, Fargo & Co., \$14,500 by McCormick & Co. and \$5155.64 by T. R. Jones & Co.

About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however, and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first in payment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$90 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawing or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings oftentimes prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 28 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications entrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily when distant agents are employed is wasted in preliminary writing back and forth.

The happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording thus the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the inventor to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the inventor is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$1 to \$25. The Government fee is \$9 additional. To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DYNAMO-ELECTRIC MACHINE.—Angust Harding, Oakland. No. 385,458. Dated July 3, 1888. The object of this invention is to provide an improved and convenient construction of the frame of the revolving armature and of the commutator sections, so that the parts may be easily separated or assembled. The different parts of the armature are perfectly and completely separated from each other and the commutator, by its construction, overcomes the common difficulty of short-circuiting.

LAMP BRACKET.—Alfred Tharber, S. F. No. 385,486. Dated July 3, 1888. This bracket for supporting lamps consists of a pair of semi-circular jaws, the outer ends of which are made to receive and hold the lamp body, while the inner ends are hinged together with a peculiar arrangement of the box within which the inner ends are contained and the spring by which the jaws are closed. By the construction devised all the parts may be put together without the use of the screws, and are very easily adjusted or taken apart whenever desired. By extending the rear portion of the jaws behind the pivot point within the case they serve to steady the jaws and prevent them from swinging from side to side.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Iron Mountain, July 7, \$16,000; Riley & Bites, 7, \$4,000; Uncle Sam, 7, \$5,000; Con. California and Virginia, 7, \$92,203; El Dorado Tunnel (for June), \$16,026; Savage, 7, \$34,550; Hale and Norcross, 7, \$155,000; Con. California and Virginia, 10, \$68,506—total for June, \$405,834. Shipment of Eureka Con., quoted in PRESS as \$4000 June 30th, was really \$16,000. Germania, July 3, \$1496; Hanauer, 3, \$3900; Queen of the Hills, 3, \$1100; Silver Reef, Utah (for June), \$21,517; Germania, 4, \$1340; Hanauer, 4, \$1880.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daguerre, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Platform Scales, Mill Scales, Assaying outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPIE & CHILDS, 123 California street, San Francisco.

Mining Share Market.

Notwithstanding the favorable outlook of the Comstock mines, the shares in the market show rather a decline than otherwise. The more hollowness the mines turn out the lower shares go. While ore which promises many more dividends is known to be in sight, yet the rapid decrease of volume of water in the Carson river forebodes a decrease in milling facilities and a consequent liability of assessments.

According to the monthly financial statements, the following companies have cash on hand: Alpha, \$14,307.48; Andes, \$14,626.82; Belcher, \$6879.66; Bulwer, \$19,048.88; Ballion, \$9738.32; Bodie, \$42,053.31; Bello Isle, \$8148.54; Crown Point, \$16,027; Con. California and Virginia, \$172,932.93 in cash and \$178,392.61 in unsold bullion, and about \$165,000 more in bullion to arrive; Crocker, \$15,270.85; Con. Imperial, \$4229.99; Dudley, \$489.16; Exchequer, \$10,522.56; Found Treasury, \$266.51; Independence, \$4835.80; Julia, \$1524.88; Mexicon, \$7130.63; Mono, \$18,625.24; Navajo, \$714.05; North Belle Isle, \$30,087.07; Ophir, \$2221.35; Occidental, \$8181.51; Pondera, \$150; Peerless, \$18,867.01; Sierra Nevada, \$3537.25; Syndicate, \$9853.89; Standard, \$42,651.92; Utah, \$17,606.33; Weldon, \$4326.30.

The following companies have an indebtedness: Best and Belcher, \$5123.89; Chollar, \$46,555.48; Commonwealth, \$11,761.03; Del Monte, \$3701.41; Gould and Curry, \$8096.64; Grand Prize, \$30,182.35; Locomotive, \$6107.41; Nevada Queen, \$28,381.75; North Commonwealth, \$9036.42; Potosi, \$55,570.49; Peer, \$1643.07; Savage, \$46,937.40; Seg. Belcher, \$28,719.63.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

AUTO-PNEUMATIC CAR MOTOR CO., July 9. Capital stock, \$1,000,000. Directors—R. H. Marchant, A. A. Hibbard, W. H. H. Graves, Chas. Hadenfeldt and John C. Reud.

CALIFORNIA BITUMINOUS BLOCK MANUFACTURING CO., July 9. Capital stock, \$200,000. Directors—H. Dutard, A. Halsey, M. B. Pond, W. C. Watson and A. Judson.

VIRGINIA & GOLD HILL ELECTRIC LIGHT CO., July 9. Capital stock, \$250,000. Directors—W. E. Sell, C. T. Bridges, N. D. Anderson, Chas. S. Wheeler and A. W. Riss, Jr.

TUSCARORA WATER CO., July 9. Location, Tuscarora District, Elko Co., Nev. Capital stock, \$500,000. Directors—Thos. Ball, Daniel Meyer, John F. Casswell, P. C. Hyman and C. B. below.

PORTLAND MINING CO. (OREGON), July 7. Object, development of mines in Oregon and Idaho. The company owns four mines on Beaver creek, Coeur d'Alene, the Silver Tip, Sitting Bull, Red Dragon and Mule Deer. Capital stock, \$5,000,000. Directors—John C. Davenport, J. H. Smith, P. O. Kaufman, J. P. Kohler, John Markle, G. B. Markle, Jr., W. H. Sherman and O. F. Paxton.

Appreciative.

The MINING AND SCIENTIFIC PRESS of June 23d is a 32-page edition and devoted mainly to an exhaustive and intelligent description of the Lick Observatory at Mt. Hamilton. A perusal of this issue of the PRESS will repay those who are interested in matters telescopic, and also those who wish to keep posted on California's progress as an enterprising State.—*North San Juan Times.*

GOVERNMENT BUILDINGS.

WELLINGTON, June 3, 1888.

EDITORS PRESS.—I have to inform you that having received no copies of the MINING AND SCIENTIFIC PRESS by the last mail, I feel uneasy, as I have each volume bound as it comes out, and therefore do not wish to lose any of the numbers. I look upon your paper as the most valuable one that comes into this colony for the mining class, and therefore regret the temporary stoppage very much.

Yours faithfully,
HENRY A. GORDON,
Inspecting Engineer, Mines Dep't, New Zealand.

San Francisco Metal Market.

REDUCTION WORKS are to be constructed at National City, San Diego county, and \$30,000 will be expended on the plant. The projectors claim they can handle \$10 ore, and will begin smelting Sept. 1st. They expect ore from Arizona, Lower California and San Diego county. The plant will be one of 50-ton capacity.

The steel cruiser Charlestown, the first man-of-war ever built in a private yard on this coast, will be launched from the Union Iron Works shipyard on Thursday, July 19th, at 7.30 P. M.

SILVER CITY, Sierra county, this State, is earning for itself the reputation of a very rich mining camp.

The Lick Observatory—Illustrated and Described.

THE MINING AND SCIENTIFIC PRESS of June 23, 1888, contains an elaborately illustrated description of the Lick Observatory and all its appliances. The information given is very full in all details. There is a history of the Observatory from its inception, and a biographical sketch of the founder, James Lick, with portrait.

The description of the buildings includes the main building, library, dome for the 12-inch equatorial, meridian circle-house, transit-house, photographic laboratory, dwelling-houses, water-supply, etc

A NEW PAPER BINDER
—A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, and very cheapest of all economical and practical file binders. Newspapers are quickly placed in it (as received) and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price (size of this paper, Harper's Weekly, and Scientific American), 75 cents; postpaid to purchasers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Siles quartz machinery, and offers easy terms for introduction.

DIVIDEND NOTICE.

THE GERMAN SAVINGS AND LOAN
Society, 526 California St.—For the half-year ending June 30, 1888, a dividend has been declared at the rate of four and one-half (4½) per cent per annum on term deposits, and three and three-quarters (3¾) per cent per annum on ordinary deposits. Payable on and after Monday, July 2, 1888.

Designs and Estimates furnished on application.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurly-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tallings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

FOR SALE.

A half interest in a gold bearing quartz mine, situated at Mokelumne Hill, Calaveras County. Two shafts sunk 60 and 110 feet, respectively; also a level run at the bottom of the 110 foot shaft about 100 feet. The ore body averaged three feet strong, and varied from \$10 to \$20 per ton. A tunnel was since run 300 feet, and a ledge has been struck which is four feet in width. This ore will yield \$5 to \$6 per ton. It is only sixty feet from the surface. The object of selling the above-named interest is to obtain some responsible party, with means, to sink a shaft 300 feet, and run several drifts along the ledge. The present owners ceased operations for want of working capital. None but principals need apply. The party purchasing must commence operations within thirty days from date of signing contract and work continuously and systematically till the shaft is completed. It is patented property. Address,

ABRAM SHEAR.

BELTING, OILS and GENERAL SUPPLIES.

We are prepared to give estimates for Hoisting Works and Pumping Plants, Stamp Mills, Smelters and Concentrators.

THE RAND DRILL COMPANY, 23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

FRISBEE WET MILL. DOUBLE "ECONOMIC" STAMP MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager. - - - 461 Howard St., San Francisco

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS**, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U.S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin et al.

We also manufacture the **Single-Jointed Giants**.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

ADAMANTINE.

H. D. MORRIS,

220 Fremont St., San Francisco,
MANUFACTURERS' and PURCHASING AGENT.

Special attention given to purchase of

MINE and MILL SUPPLIES.

ADAMANTINE SHOES AND DIES.—Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.
H. D. MORRIS.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

The Cruiser "Charleston."

A Government Vessel Built in California.

On this page is an engraving of the U. S. Cruiser "Charleston," as she will appear when completed. This ship is the first steel man-of-war ever built on this coast by private enterprise, and her launch occurs to-day (Thursday) from the yard of the Union Iron Works, at the Potrero. The hull is completed, but the vessel has yet to receive her propellers, armament and machinery. She is launched now in order

screws. The stem, stern-post, rudder and shaft tubes and brackets are of cast steel. The remainder of the vessel is of wrought or rolled steel. The outside plating is 7-16 to $\frac{1}{2}$ inch in thickness, the inner bottom plating $\frac{1}{4}$ to $\frac{5}{16}$ of an inch, the shear strokes $\frac{3}{8}$ to $\frac{7}{8}$ inch.

The conning tower is on the forward ridge, and is two inches thick on the sides with a three-quarter inch top.

All the steel used in the construction of the hull and all for the engines (except the crank and line shafts, which were made by Krupp, at

The propellers are 14 feet diameter, made entirely of manganese bronze. The hubs are held to the shaft by big nuts, over which screw pointed bronze caps, giving a very finished appearance. Three blades are strongly secured to each hub in such a manner that the required pitch, 18 $\frac{1}{2}$ feet, may be changed if necessary, to any desirable pitch.

Her boilers and machinery will be placed in the lower or protected deck, below the water-line. The other two decks will be used as store-rooms, sleeping-rooms and the like.

one each. Every room in the vessel will be ventilated by artificial means.

The armament will consist of two eight-inch breech-loading rifles, one forward and one aft; weight, 28,000 pounds. The charge of powder will be 125 pounds, the shell will be 250 pounds and the range about eight and one-half miles. The penetration at 1000 yards is 15.1 inches, wrought iron; the penetration at 2000 yards is 13.6 inches, wrought iron.

Six six-inch, mounted in broadside; weight, 11,000 pounds; charge, 50 pounds; shell, 100

THE CRUISER CHARLESTON—THE FIRST STEEL MAN-OF-WAR BUILT IN CALIFORNIA.

to make room for another cruiser for which the same works have a contract.

This fine specimen of naval architecture is no experiment, two vessels of similar design having been previously constructed. One of them was the Chilean cruiser Esmeralda, the other the Naniwa Kan, built for the Japanese Government. This latter ship was used for a guide when the Charleston was designed. The contract for building the Charleston was signed December 26, 1886, and the cost of the hull and machinery was to be \$1,017,000. Owing to delay in obtaining the steel plates, the keel plate was not laid until August 27th of last year, though much of the steel angles, bars, etc., were prepared here in readiness for the work.

The following are the principal dimensions of the Charleston: Length over all, 320 feet; length between perpendiculars, 300 feet; extreme breadth, 46 feet; depth, 34 feet; draught of water forward, 17 $\frac{1}{2}$ feet, aft, 19 $\frac{1}{2}$ feet; mean draught, 18 $\frac{1}{2}$ feet; displacement, 3730 tons. She is built entirely of steel and has twin

Essen,) is of domestic manufacture, known as mild steel, made by the open-hearth process.

The vessel has a steel ram projecting six feet ahead of the perpendicular line of the bow. The stern weighs 13,000 pounds, and the steel stern-post weighs 11,000 pounds, and were both made in this State.

There are two main engines; they are compound and direct-acting, with a high-pressure cylinder of 44 inches in diameter and a low-pressure cylinder of 85 inches in diameter, both cylinders being inclined a little from the horizontal. The engines weigh about 50 tons apiece, and are supported by a rigid foundation built up from the inner bottom and calculated to reduce vibration to a minimum. The stroke of the pistons is 36 inches, and the maximum power is to be obtained with 90 pounds of steam in the boilers.

There are six main boilers, three in either boiler-room; those in the forward room are 11 feet in diameter and 19 feet 3 inches long; those in the after, 11 feet 6 inches in diameter and of the same length.

For the greater part of the ship's length, running parallel with the bottom plating up to three feet above the bilge-keels, is the inner bottom; between the two bottoms is a space varying from 36 inches deep in the middle to 27 inches at the sides, perfectly water-tight and subdivided into 11 water-tight compartments, to which entrance, if necessary, is had through manholes closed with brass doors. By a system of piping, as many of these compartments as desired may be flooded with water, thereby sinking the ship further below the surface.

There are 29 different water-tight compartments on the protective deck, which is also made water-tight, so that if in action water is let into one, or if several of them are knocked into one, the ship will still float.

The Charleston will be lighted throughout with incandescent lamps. Two independent dynamos, with a light-producing capacity of 3200 candle-power each, will be provided, one to be used in case of accident to the other. There will be about 400 lights, even the Gatling gun stations at the mastsheads being fitted with

pounds; penetration at 1000 yards, 10.8 inches, wrought iron.

Secondary battery—Two Gatling guns; four six-pounders, Hotchkiss rapid-firing guns, penetration, steel plate at point blank, 5.1 inches; two three-pounders, Hotchkiss rapid-firing guns, three inches; one one-pounder, Hotchkiss rapid-firing guns, 2.87 inches; four 37 mm. (1.45 inches), revolver cannon, projectile weighs 1.87 pounds.

The work done on this vessel by the Union Iron Works is greatly to their credit and must redound to the benefit of the industrial interests of California. It was not thought that facilities for such work existed on this coast until the Union Iron Works put in their bid. The proprietors of these works have shown in a practical manner that we are able to compete with the East in an important branch of industry. It is expected that in about five months the Charleston will be ready to make her trial trip. As the launch occurs after we go to press, we can give no description of it until next week.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Debris Dams.

EDITORS PRESS:—Touching the subject of debris dams, it may be that some of your readers do not quite understand this proposition.

It is conceded that not the coarse sand and finer gravel, and much less the coarse gravel, which scarcely reaches the rivers in any case, but the fine silt and mud (slicens), constitutes the chiefly objectionable element of mine debris. It is also conceded that a reservoir to retain the slicens, so that the water may become as clear as is required, would of necessity be of very large area and of great depth, so that it would have the dangerous elements of a water reservoir; that is to say, an immense volume of water and heavy pressure on the dam. It may also be allowed that an extensive accumulation of any kind of loose material in the channel of a mountain river would be objectionable because, although such accumulation might be confined to the coarser sand and gravel, which may be retained without any great or dangerous depth of water, and therefore without great hydraulic pressure on the dam, by the simple expedient of raising the dam and the outlet only as required from time to time, allowing the muddy water and suspended silt to pass off; yet, in the channel of a river which is exposed to heavy freshets, as are all of our mountain rivers, the occurrence of such a freshet, which no artificial outlet could accommodate, would endanger the integrity of any dam which it would be feasible to build for the purpose. If the dam should give way, although the result would not be such a deluge as would occur in the case of a large reservoir of water, yet the accumulated sand and gravel would be "ground-sliced" out by the continued torrent, and the object and purpose of the dam would be defeated.

But the idea of sensible thinkers on this subject is, neither to retain all the slicens by means of artificial reservoirs, nor to obstruct the channels of mountain rivers by retaining the coarser material therein.

The plan which may be feasible, which is surely possible, in some cases at least, and which therefore ought to be investigated by competent engineers, is to conduct the water and tailings into such natural or artificial (as worked-out hydraulic mines, etc.) hollows, ravines or basins as may be adapted to the purpose by means of dams and outlets to be raised periodically as required, and which are not exposed to freshets of sufficient force to endanger the dams; there to retain the coarser sand and the gravel, and then to conduct the overflow, carrying the silt, etc., by means of canals and flumes when required to the tule basins or other low-lying lands which would be benefited by an accretion of from 2 to 20 or more feet of material which experience has proved to form an excellent quality of arable land. In some cases it might be necessary to throw up levees on one or more sides of such low tracts, but this would not be required for the tule bottoms.

Any flumes which might be needed for the conveyance of the coarser material to a place of deposit would, if properly constructed, pay for themselves by retaining a quantity of gold which the continued washing would release from imperfectly disintegrated cement and gravel, and the attrition of auriferous stones.

There in the valleys are immense tracts of veritable, not merely technical, "swamps and overflowed land," and other large areas of nearly barren mesa, to which the advent of this mud-laden water would be as the annual overflow of the Nile to the otherwise barren regions through which that river flows; and here are mountains of earth, with money in their pockets, so to speak, to reward the enterprise which shall put them where they will do the most good, and with untold and incalculable potency for productivity, locked in their "molecular constitution," which only awaits the advent of a favorable environment to develop a fertility equal to that of the river bottoms, which are nothing but the slicens of Nature's hydraulics.

Here is an engineering proposition with pay at both ends, or at least with probable profit at the first and a certain remuneration at the last. And there sits supreme authority (!) and from out the folds of the judicial ermine solemnly proclaims an impossible impossibility!

I say it is impossible that it should be impossible to do this thing!

The engineers of England and France stand ready to bridge or tunnel the British channel. De Lesseps is cutting the western hemisphere in twain; the Suez canal, once declared "impossible," has long been an accomplished fact. Hundreds of triumphs of engineering skill attest the possibility of impossibilities; and shall American skill, courage and capital recoil from a simple question of ditching?

Whether such a work would pay or not is not the present question. I believe it would, in the long run, if not immediately, but I opine it is not within the province of the courts to pronounce on this matter, which concerns rather those who might be willing to take the risk, and I feel sure that, if not we, our posterity will find some way in which to reconcile the seemingly antagonistic interests of the mountains and the valleys.

July, 1888.

C. H. AARON.

Amador County Mines.

The Zeile Mine.

EDITORS PRESS:—This mine keeps constantly in motion and is the life of Jackson, employing a large force of men. The mill of 40 stamps puts through about 100 to 125 tons of ore per day. Some seven or eight years ago when the present superintendent came in there this mine was largely in debt and this ore being of so low a grade the outlook was almost discouraging enough to close down the works. But since then Mr. Deters has not only made it pay, but the indebtedness was all paid up very shortly, and now there can be no question as to its future permanency.

The Amador Gold-Mining Company, Between Butte City and Jackson, has arranged for and is just about starting to build a 40-stamp mill. The contract has been given out and this company will, ere long, be another to add to the wealth of not only the county but also the State, as they have some five ledges, all of which have been thoroughly prospected, justifying them in the large undertaking they have entered upon. This will give employment to a large number of men and materially add to the output of gold for this district. The property, we believe, is owned principally by Jno. J. Minear.

The Amador Reduction Works At Sutter Creek are now in full blast, receiving sulphurets from not only this county but from various other adjoining counties for reduction and treatment. They have a complete plant quite equal to the best. This company also purchases sulphurets from parties who prefer to sell by sample and realize ready cash.

The Boettner Mill and Mining Company. This company having suspended operations for a long time past on account of litigation, is, we understand, on the eve of an adjustment that will shortly, it is to be hoped, place them in position to again come to the front and soon be numbered among the gold-producers of the county.

The Satter Creek foundry is in full operation, turning out mining machinery for the mines throughout this and the adjoining counties.

The Spring Hill mine, under the able management of John R. Tregloan, is in full running order, 30 stamps continuously going, water abundant, and everything about in a prosperous condition. The ore, like most on the lead, is of low grade.

The Keystone mine and mill is running the full complement of stamps, 40 in number, and employing about 100 men. This is one of the permanent mines of the county, and under the management of Mr. O. C. Hernet as superintendent.

The Wildman Mine At Sutter Creek is now down about 500 feet. They have just put in a new pump, and are running ten stamps. The ore pays from about \$2.50 to \$10 per ton. It is the intention of the owners, very shortly, to erect an additional ten stamps, making 20 in all. They have excellent hoisting works, and have a water pressure of 450 feet for power purposes.

The Bunker Hill Mine, Just below Amador City, with Mr. Parker as superintendent, is getting out large quantities of ore, and transporting it to mill some distance below, requiring two mules to bring back return cars, which hold about three tons each when full. This ledge is a very large one, and although of very low grade, yet leaves a large margin for profit over and above expenses. It is surprising how cheaply ores can be mined and milled with proper facilities for handling. It is now well understood among practical mining and millmen that where large bodies of regular pay ore occur, with advantageous handling and sufficient milling facilities, ores that pay only as low as \$1 per ton can be mined and milled to a profit, as not only this but other counties adjacent have practically demonstrated.

The Mahoney Mine Is now lying idle, although it is considered a most excellent property. The three brothers Mahoney all took out a fortune each from this mine, and it was perhaps a misfortune that they did, for it led them into dissipation, which has ended the days of all of them, the last surviving one having been hurried only a few days ago.

The Guver Mine and Mill Of 40 stamps is pounding out rock constantly, which is paying from \$9 to \$13 per ton. This, considering the size of the ledge, is an exceedingly valuable mine. We hear that a purchaser made an offer for it fully equal to the price asked only a short time since, but the owners refused to sell, thinking its value increased much more than double. The

Pinto Mine, Near Drytown, has shut down on account of want of water, but we hear they will soon add 20 stamps to the mill, making 40 in all. They will also arrange to bring in a water supply for all purposes required.

Plymouth Mines and Mills. This pretty little mountain town, only a short time since so flourishing and lively, is now almost dead, the cause being the closing down of the Empire and Pacific mines and mills. This was caused by the fire in one of the mines some months ago, but which has been put out long ere this not only by flooding

with water, but also from the introduction of gases that would smother it.

Now, there seems to hang a mystery about the closing up, for there is no concealing the fact that the mines are most excellent paying properties and can and will continue to be so for an age to come. The question is in everybody's mouth: What does it mean? Yet none can answer; none can solve the problem. The universal dullness caused by this closing down is manifested everywhere around this vicinity, for money is scarce and credit is at a discount. The ranchers around have no money, nor can they support the town. What will be the outcome none can tell but the owners, and they won't.

This brings to memory the famous Sisson mine, only about four miles distant, owned also by one of the same parties. This property has lain idle for some few years past, yet everybody knows it is as good as any in the county, but the owner will not work it himself or let any one else.

The ditches and reservoirs have been permitted to go to ruin and become filled up and broken down, though they could have been utilized by ranchers for irrigating purposes, if no other. Yet all seems to have been permitted to go to destruction together, all of which is as mysterious as the other.

This shows the great importance of the mining industry of the State and the fostering of the same. Stoppage of the work means ruin to the district. Even when temporary, it takes a long time to recover from the effects, and is greatly to be deplored, under any circumstances.

W. A. K.

The Stewart Mining Bill.

The Proposed Changes in the Law.

In the last number of the PRESS we published a letter from Hon. W. M. Stewart of Nevada, in which he states that it is not probable that the mining bill will become a law at this session of Congress. In answer to our request he has sent us a complete copy of the bill as it passed the Senate. As the matter is of importance to miners, we here republish, from last week's PRESS, Senator Stewart's letter, and append the bill in full. It should be kept for reference by all interested in the subject.

UNITED STATES SENATE,

WASHINGTON, June 30, 1888.

Editor "Mining and Scientific Press"—DEAR SIR:—On my return from Chicago I found your favor of the 8th inst. Inclosed I send you a copy of the mining bill introduced by me as it passed the Senate. It is still pending in the House Committee on Mines and Mining. I do not know what action the committee proposes to take on it during the present session. It may be amended in some particulars. I have received many letters from mining men suggesting amendments to the bill, and I may submit some of them to the House Committee. A suggestion in a letter I have just received from Enreka, Nevada, seems worthy of consideration. It is to the following effect: If the same person, corporation or association own several claims which combined do not exceed 1500 feet in length by 600 feet in width, the owner may make a relocation of the same and obtain a patent therefor in one application, provided adverse rights are not affected thereby.

I have not pressed the bill in any haste; there is no difficulty in passing it when perfected. My anxiety has been, and still is, to have the bill when passed remedy the defects which have been discovered by experience under existing laws. Any suggestions, therefore, in regard to the bill are very welcome. Yours truly,

WM. M. STEWART.

A BILL

To amend Chapter six of Title thirty-two of the Revised Statutes, relating to mineral lands and mining resources.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section twenty-three hundred and nineteen of the Revised Statutes be amended by adding thereto the following:

"But no person shall acquire, by location or possession, more than one mining claim on the same vein, nor shall any person relocate a claim which he has previously located."

Sec. 2. That section twenty-three hundred and twenty-four of the Revised Statutes be amended so as to read:

"SEC. 2324. The miners of each mining district may make regulations, not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located as will identify the claim. On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until a certificate of entry has been issued therefor, not less than one hundred dollars' worth of labor shall be performed, or improvements made during each year. On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made during each year, for each one hundred feet in length along the vein until a certificate of entry has been issued therefor; and for each twenty acres of placer claims, and for each subdivision thereof, less than twenty acres, fifty dollars' worth of labor shall be performed or improvements made during each year until a certificate of entry

shall be issued therefor. The period within which the annual work required to be done by this section shall commence at twelve o'clock meridian on the first day of August of each year: Provided, That upon claims already located previous to the first day of March in any year the annual work shall be performed on such claim for that year prior to twelve o'clock meridian of the first day of August next succeeding. And the time for performing annual work on claims heretofore located is hereby extended to the first day of August at twelve o'clock meridian. When the labor required by this section shall have been performed or the improvements made, an affidavit shall be filed with the officer authorized to record deeds in the county in which the mine is situated, particularly describing the labor performed and improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated. And upon a failure to comply with these conditions, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made: Provided, That the original locators, their heirs, assigns, or legal representatives, do not resume work upon the claim after such failure and before such location, and continue the same with reasonable diligence until the required amount of labor shall have been performed or improvements made. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvement may, at the expiration of the year, give such delinquent co-owner personal notice in writing or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing or by publication, such delinquent shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditures, and such co-owner may relocate such individual interest in his own name. When a person or company has or may run a tunnel for the purposes of developing a lode, owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode, and such person or company shall not be required to perform labor or make improvements on the surface of said lode in order to hold the same."

Sec. 3. That section twenty-three hundred and twenty-five of the Revised Statutes be amended by adding thereto the following:

"But no more than three thousand feet in length along the vein of claims located prior to the tenth day of May, eighteen hundred and seventy-two, and not more than one claim located after said date shall be included in the same application for a patent, and not more than one hundred and sixty acres of placer ground shall be included in the same application for a patent."

Sec. 4. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths in any State or Territory of the United States or in the District of Columbia, and all testimony and proofs may be taken before any such officer, and, when duly certified by the officer taking the same, shall have the same force and effect as if taken before the register and receiver of the land office. In cases of contest as to the mineral or agricultural character of land, the testimony and proofs may be taken, under such regulations as the Commissioner of the General Land Office may prescribe."

Sec. 5. Amend section twenty-three hundred and thirty-eight of the Revised Statutes so as to read:

"SEC. 2338. As a condition of sale, each patent shall reserve the right of way through or over any mining claim for roads, ditches, canals, cuts and tunnels, for the purpose of working other mines: Provided, That any damages occasioned thereby shall be assessed and paid in the manner provided by the laws of the State or Territory in which such mine is situated for assessments and payments for land taken for public use under the right of eminent domain. And the rights and easements reserved under the provisions of this section in patents heretofore issued shall be regulated and made available as herein prescribed."

Quicksilver Ores in Mexico.

By the courtesy of the officials of the State Mining Bureau we are permitted to publish the appended letter from Jno. W. C. Maxwell. This gentleman has presented to the Bureau several interesting specimens of quicksilver ores, among which were two specimens of Livingstonite (a sulph-antimonide of mercury) from Mexico, and accompanied the same by the letter to the State Mineralogist, which we here publish:

Wm. Ireland, Jr., Esq., State Mineralogist of California, San Francisco.—DEAR SIR: The specimens of quicksilver ore herewith presented to the State Mining Bureau are selections from among a number of samples I had occasion to take recently in an examination of mines of this metal in the Republic of Mexico.

While but two of the specimens differ materially from the general character of ore of this metal produced by the mines of California, those from the mine of Santa Rosa, located on the line dividing the States of Mexico and Morelos, possess an especial value from a historic point of view. The mining literature of Mexico accredits this property with having been the first producer of quicksilver in that country, if not on this continent. Certain it is, however, that as early as the year 1718, it was in operation, for by a "Cedula" (an order of the Spanish sovereign) dated at San Lorenzo, July 5th of that year, directed to the "presidente and oydorea of the audiencia of the City of Mexico, in the province of New Spain," D. Juan Joseph de Veitia was commanded to "close and destroy the works and mines or

THE St. Joe Co., Missouri, is turning out lead at the rate of 14,000 tons per annum.

4th. If the beat one of only two or three

The heat method of determining the strength of the hyposulphite solution is by starch and iodine. The reactions for this method are given in works on chemistry, but a description of the practical application of this method to the leaching process cannot safely be omitted here. If a small quantity of starch is present in a hyposulphite solution, and a solution of iodine is added, drop by drop, the sensitive blue color of iodide of starch will continue to be destroyed as fast as it is produced, as long as any hyposulphite exists. As soon as the

It cost the Con. California and Virginia mine last month \$47,497 for labor and \$91,210 for reduction of ore.

Passing Events.

The launch of the steel cruiser Charleston from the yard of the Union Iron Works is quite an important event in connection with the industrial interests of this coast. This is the first man-of-war built here at any private yard, and another one is to be commenced immediately. The enterprise of the Union Iron Works is greatly to be commended.

The collapse of the great mining-stock excitement in Australia was anticipated by all who had passed through similar experiences here. Inflation of values is seldom attended with worse effects than in connection with mining shares.

The great Educational Convention now in session in this city has brought many thousand intelligent visitors to this State. Gatherings of this kind are sure to bring good results to California, since these visitors will advertise its advantages all over the United States.

There is nothing that is new in the mining situation aside from what we give in our "summary" on another page. All over the coast the miners are engaged in development work, and the general results are very gratifying.

THE Idaho gold mine, Grass Valley, this State, has to date paid \$4,500,000 in dividends.

Reese River—What it is Like and What Becomes of it.

The following paragraph is going the round of the newspaper press, quoted, we suppose, because it is thought to show the extent to which irrigation is being practiced in the locality designated, which, however, it fails to do:

"Although Reese river in Nevada is hank full near the head, its waters never reach the Humboldt. All the water is turned aside for irrigation."

As stated, Reese river, near its head, is now running hank full, that is, as full as they usually get, this being the time of year when, owing to the melting of the snow on the adjacent mountains, it reaches its highest stage. In this particular the paragraph quoted is right enough, though in one or two others it is open to correction.

And first let it be premised that Reese river, while marked by certain peculiarities and covering a good deal of linear space, is no river at all; though nearly a hundred miles long, it is not, as regards the volume of water it carries, even a good-sized creek. There is hardly a place throughout its entire length but what an athlete could leap across or ford it without swimming. In width it varies from 12 to 15 feet and in depth from 2 to 3 feet, these measurements being quite uniform.

It runs with few sinuosities and a rather brisk current through a broad sagebrush plain—Reese River valley. Its immediate hanks, though low, are never overflowed except when a "cloudburst" may happen to break within its water-shed, a thing of rare occurrence. Gradually, as the snow on the mountains melts, the water flow increases until early in July, when, having reached its highest stage, it gradually subsides without ever overflowing the river-hanks or filling them quite full. The mountains that hem in this valley consist of the Shoshone on the west and the Toiyabe on the east, the two uniting at its head. The Toiyabe is a high and precipitous range, some of its deeper canyons, of which it has many, holding snow until late in the summer.

After pursuing its course for 35 miles, Reese river disappears, its water for the next three or four miles being lost in a broad expanse of meadow land which absorbs it so completely that there is here no surface channel or sign of there ever having been any. Why at this point the stream should have been so arrested and swallowed up, or why at the lower margin of this oasis it should have gathered itself up and resumed its course, is a puzzle to those who have studied this phenomenon.

The restored rivulet, after journeying north another 50 miles or more, makes its final exit, but here not quite so abruptly as at the meadows above. Having gotten thus far, it disappears in a succession of pools standing along its well-marked bed, dies, not suddenly, but in convulsions, as it were. Its objective point is evidently the Humboldt, but it seldom reaches that river, at least above ground, though some of its water no doubt gets there through subterranean channels or by percolating through the porous soil. Not more than two or three times during the past 30 years, that is, since this section of Nevada has been settled or much traversed by the whites, has this rivulet been known to flow above ground all the way to the Humboldt. That it fails to do so is, however, not because its water is diverted for land irrigation, though the most of it is now used for that purpose.

When this stream happens to reach an unusually high stage these stagnant ponds fill up and becoming united form one of those broad, shallow and often evanescent lakes known as "sinks" in the hydrography of the great Utah basin, this being laid down on the maps as the "sink of Reese river." Not elsewhere in all the arid interior do so many considerable streams give out and die in these sedge-bound "sinks" as here in Nevada. Neither in this State, in the Territory of Utah nor in Trans-Sierra California does more than a small proportion of the water flow to the ocean. The most of it is gathered into lakes and "sinks," whence it escapes by evaporation, a process that, in the desiccated and rarified air, goes on rapidly. Having no outlet, these bodies of water become intensely saline.

That such a petty stream as this we are speaking about should have been called a river by the man who first came upon it is not at all

strange, considering the circumstances under which it was discovered. Prior to about 1850, the overland immigration, including the Mormon colonists moving west from Salt Lake City, keeping to the north of Great Salt Lake and striking across to the headwaters of the Humboldt, had followed down that river. This being a very circuitous route, Col. Reese, who had already made several trips from Salt Lake City to the Mormon settlements in Western Utah, conceived the idea of finding a shorter one between these two points. In pursuance of this purpose, on leaving the former place, he kept to the south of Great Salt Lake, following what became afterward the Overland Stage and the Pony Express route. Having encountered but few springs and no large creeks, this desert stream, when he came upon it, seemed to Col. Reese, we can well believe, a veritable river, being much the largest running water he had seen since leaving the Jordan. Perceiving by the osier willows that fringe its banks that it extended a long way up and down the valley, the "path-finder" is to be excused if in his imagination the proportions of the brooklet seemed unduly great.

While Reese river is thus marked by certain strange features, it is neither a picturesque nor an eccentric stream. Though small compared with most California rivers, it does not, like some of them, become a raging torrent in the winter and dry up in the summer. Keeping within its low hanks, it flows quietly but quickly along and with little meandering. It murmurs and ripples, but does not break into violent rapids, nor does it anywhere throw itself over precipices creating falls, cascades or other notable object. Stopping short of its goal some 25 miles, it forms the marshes and fens about which the wild rye and the hunch grass contest with the omnipresent sage for supremacy. Though it presents little of interest to the sightseer, it is of great service to the cultivator of the soil, since neither fruit, grain nor vegetables can be raised here without irrigation.

Diamond Mining.

We have received from Gardner F. Williams, formerly of California, but now general manager of the De Beers Diamond Mining Co., South Africa, the report of the operations there during the past year. During the year, 873,178 loads of "blue ground" have been hauled by the De Beers Co., and 857,906 washed, yielding 979,732 carats of diamonds, realizing £984,035, 14s. 6d. The expenditure connected herewith was £415,188 1s. 11d., leaving a profit of £508,897 12s. 7d. on the actual working. The average yield per load was 1142 carats. This year's working has been solely underground, and the heavy expenditure incurred in previous years for reef work has been done away with. The working expenses, however, will be largely reduced, now that the underground works and machinery are approaching completion. The company was fully justified in its anticipation of the output from the sloping shaft, as the average of the current year has been 2540 loads per day. A second sloping shaft at the west end of the mine will enable them to double the amount.

Convict labor has continued to prove satisfactory. Complete success continues to attend the system of "compounding" the free native laborers. The buildings accommodate 2500 natives.

The balance-sheet and statement of profit and loss of this company show a balance of profit for the year after payment of dividends (\$508,042) of £237,772, being an increase on the year of £58,686. The Oriental and Victoria Companies' properties have been amalgamated with the De Beers mine, and the company has purchased the French Company's property on the Kimberley mine.

Since 1881 this company has paid in dividends £1,013,299, and 41 per cent has been distributed in bonus shares.

When Mr. Williams took charge of the property a year ago the only available means of extracting diamond-bearing ground ("blue") from underground works was through a west end incline shaft. This was originally constructed to haul 1200 or 1500 loads of 16 cubic feet per day of 24 hours, but this capacity has been increased to 2540 loads.

To increase the output, a tunnel was made 380 feet from surface and an aerial tram constructed. A vertical shaft was sunk in the blue

from the 380 to the 505 level, from which blue was hoisted to supply the aerial gear. While the aerial gear was running they hoisted 111,394 loads of 10 cubic feet.

A new shaft was started at the west end of the mine. It has an incline of 56 degrees. This is a two-compartment shaft, is completed to the 685-foot level, and will be an important addition to the workings. The mine was usually worked as an open quarry down to 400 feet, aerial trams being used. But this method was ruinously expensive, and tunnels and galleries were cut. These galleries are worked out 18 feet wide, 18 feet high, leaving a roof of 12 feet of solid blue which forms the floor of the level above, and a solid pillar 18 feet thick between galleries. By the first working of the galleries, 30 per cent of blue is taken out. The tops of galleries or highest levels are then taken out, and the galleries filled with debris from above; lastly, the pillars are removed, and thus nearly the whole of the blue is extracted. This method of working is repeated from level to level.

Mr. Williams estimates that he has "in sight" 7,150,000 loads of blue. During the year, among other work, they drove 21,621 feet of main tunnels. Mechanical haulage will soon be used, consisting of an endless wire rope driven by engine, the same as the cable railway system in use here.

Nearly all underground labor is done on the contract system at set prices per foot or load. The average number of white men employed in the mine is 214 and of natives 1350. To insure a constant supply of laborers, they have increased the accommodation of the "compound" so that they now have 2300 natives in the West End compound, which covers about five acres of ground. Within this area the natives are confined during their term of service and closely guarded, so as to reduce the stealing of diamonds. No alcoholic liquors are allowed inside the "compound."

The company has 11 washing machines and four more are being built. To these machines safety-pans will be attached for the further prevention of loss of diamonds in the washing process. A dam capable of holding 13,000,000 gallons of water has been constructed. On the "washing floors" they have 180 white men and 1400 natives at work, including 300 convicts hired from the Government. Each convict costs £58 per year.

The convict labor is the best native labor, for they are obliged to work some time, while free natives only work about two months at a time. As soon as mechanical haulage is completed all the natives will be placed in compounds, as there will then be no communication between the laborers on the floors and the outside world as there is at present through the truck-drivers. The natives on the floors have to be strictly guarded.

The working of the mine has been suddenly changed (when Mr. Williams took charge) from a huge open-quarry to the underground system. The mine will soon be in a position to furnish blue ground equal to any demands that can be made.

Mr. Williams says: "That the 'blue' will continue to be diamond-bearing to an unlimited depth there can be no doubt, and to my mind the best proof of this is that we constantly find fragments of broken diamonds imbedded in the blue, and the corresponding pieces are not found in the same neighborhood. The inference is that the diamonds were crystallized at a great depth and were thrown up with the blue ground and were not formed *in situ*."

THE employees of the Oro Fino Mining Co., Idaho, have formed themselves into a library association, and propose to employ their leisure hours more profitably than is commonly done in mining camps. Nearly every one connected with the mine has joined in this most praiseworthy movement; subscribing liberally to the fund raised to procure books, magazines and newspapers.

THE Tacoma Ledger says: The bridge at Pasco over the Columbia river, which is 2700 feet long, is completed. It was built by Principal Assistant Engineer Henson of the Northern Pacific, and the superintendent was Engineer A. S. Riffs.

A GREAT deal of ore and concentrates is now coming to the Selby Smelting and Lead Co. of this city.

The Copper Syndicate and Its Undertakings.

The operations and prospects of the Anglo-French Copper Syndicate are getting to be something of a puzzle to outsiders, if, indeed, the managers of the great "trust" are not themselves beginning to entertain some doubts as to the final outcome of their gigantic speculation; evidently things have not gone quite as expected.

This syndicate was formed toward the end of last year for the purpose of controlling the copper markets of the world, to which end, as a first movement, they contracted for the entire product of the leading copper mines on both continents, the quantity to be delivered, and the price being fixed in the contract. This done, the price of copper was at once advanced, going up within the next 90 days from 10 to 17 cents per pound—\$140 per ton.

For the accomplishment of their purpose the conditions existing at the time were extremely favorable. Stocks were limited and prices were low. The winter being at hand, it was impossible for the big companies of Montana and Michigan to increase their output without some delay, as their plant could not at that season of the year well be enlarged. The destructive fire that a few months before had broken out in the Calumet and Hecla, largely diminishing production there, also worked to their advantage.

Up to the middle of June last, the stocks of copper in England and France amounted, with cargoes afloat, to 70,000 tons, the largest ever accumulated; nor is there any reason to believe this accumulation will soon be checked. On the consummation of their scheme this syndicate calculated that production would be curtailed. But in this they have been disappointed. Encouraged by the high prices ruling for copper, new mines have everywhere been opened. Companies already operating have increased their output, while others that had long been idle have again gone to work.

As a result, the product of this metal has not only been largely augmented, but these outsiders are entering the market and underselling the syndicate. Thus far the latter has, by buying much of the copper offering, succeeded in keeping prices up to their standard, thereby averting a break in the market. But the question is, how long can they continue to do this? How long will it be under such a financial strain before something gives way? It is said that the syndicate and their friends cannot afford to let go; but, all the same, can they afford to hold on? The probabilities are that they will allow prices to gradually give way, and thus avoid any sudden crash. By reason of the prevailing high prices, manufacturers have bought copper sparingly, hoping all the while to see a drop in the market. Holding off in this manner for six or eight months, consumers' supplies as well as stocks in second hands are low and must soon be replenished. Well advised of the situation, the manipulators of the "trust," taking advantage of the exigencies of buyers, count on keeping up prices for some time to come.

Meantime, the copper-mining interest flourishes, the late advance in price having proved of especial benefit to this class of properties in California. Our copper-ore deposits are not apt to be large nor generally of high grade. Operated in the rather limited way here practiced, they have not, except in a few instances, paid much profit. Lately, however, they have been doing much better, and this under largely increased ore extraction. That the business has elsewhere experienced a like impetus it is needless to say. While copper mining is at present so prosperous, the immediate future of the industry may be said to be encouraging. While the price of this metal may at an early day be expected to suffer some decline, it will not very soon be likely to drop to former low figures, the great industrial activity prevailing the world over, forbidding such result.

The Australian Stock Boom.

There appeared in these columns not long since some cautionary remarks addressed to the people of Australia warning them against the probable effects of the speculation in silver mines and shares then raging in that country. In those remarks we counseled these people to beware of the fatal consequences that always and inevitably attend speculations of this kind, citing our own experience as evidencing the soundness of our advice, which latest accounts from that country demonstrate was more than warranted by the situation. This wild and widespread excitement had already, before the last steamer sailed from Melbourne, met with a collapse more sudden and disastrous than any

Irving M. Scott.

Probably no one individual has been more prominently identified with the industrial interests of this coast than Irving M. Scott of the Union Iron Works. Commencing as a draughtsman in these works as far back as 1858, he has seen them rise to the first position among similar enterprises in California, and has himself advanced from a humble employe to an owner and manager. A man of exceptional enterprise and public spirit, he has imbued others with his ideas until an establishment has been built up which is a credit to the coast.

Irving M. Scott was born at Hebron Mills, Baltimore county, Maryland, in December, 1837, and received the rudiments of his educa-

IRVING M. SCOTT, GENERAL MANAGER OF THE UNION IRON WORKS.

thing which has ever occurred on this coast. The nominal value of mining shares has, during the past six months, been depreciated to the extent of \$40,000,000 in the Broken Hill district alone, the drop during the two weeks preceding the sailing of the steamer having amounted to \$7,500,000.

The hursting of this mining-share bubble seems to have been followed by a business and financial panic, which, becoming general, involved thousands in ruin, besides those who had been crushed by their unfortunate stock speculations; and now the mourners go about the streets of Melbourne, Sydney and other cities on the far-off insular continent cursing the tricksters that robbed them of their pounds and shillings and hawailing their own cupidity and folly.

We knew weeks ago when the article alluded to was penned, as well as we know now, what was to be the outcome of this Australian stock boom, though we hardly looked for the catastrophe quite so soon. That the denouement has come thus early is to be accounted for, we suppose, on the theory that a short horse is soon carried and a spring gosling is easily picked!

tion in the Baltimore public schools, and afterward pursued an academic course at the Milton Academy in the same city. After completing his course of study, he in June, 1854, entered the manufactory of Ohed Hussey, the celebrated inventor of the first reaping machine, where he learned a great deal of wood and iron-working details. As he was ambitious to become an expert mechanic, in 1857 he obtained a position in the extensive iron works of Murray & Hazlhurst, Baltimore. He soon became an expert draughtsman, and his employers transferred him from the department of machinery to that of design, and placed him in charge of the construction of stationary and fire engines.

When he came to California "to grow up with the country," he was employed by the late Peter Donahue, then owner of the Union Iron Works. He remained there as draughtsman until 1862, when he took charge of the drawing department of the Miners' Iron Works, returning, however, to the Union Works in 1863. On his return he was made superintendent. When Col. Donahue retired from active connection with the works Mr. Scott became a

partner in the new firm of H. J. Booth & Co., the firm consisting of H. J. Booth, Geo. W. Prescott and Irving M. Scott. In 1875 Mr. Booth retired and a new partnership was organized under the title of Prescott, Scott & Co., the younger brother of Mr. Scott, Henry T. Scott, joining the firm. Later on the firm was reorganized under the title of the Union Iron Works, an incorporated company.

The old premises on Mission, Fremont and First streets became too small for the operations, and extensive works were erected on the Potrero. New machinery of the latest designs was purchased, splendid brick buildings put up, a large dry-dock was built, and an iron and steel ship-building plant was added to the works, which are now the most extensive on this coast, and among the largest of the United States.

When it was found that the Government was to start in to build a new navy, and that cruisers were to be constructed, an effort was made to obtain the work on one or more of these cruisers for this coast. The Union Iron Works was prepared to do any of this work, and put in bids. Mr. Irving Scott went to Washington, conferred with the Secretary of the Navy and those in authority, and convinced them that the work could be done here. In the face of great difficulties he finally succeeded in getting the work. It was mainly due to his persistent and intelligent efforts that this was accomplished, and contracts for two cruisers secured. One of these vessels, the Charleston, was launched this week, and the other will shortly be commenced.

Mr. Scott is a fine public speaker, and a writer of more than ordinary ability. His published addresses and articles always attract attention. He is known to be a thinker, and one who expresses his ideas clearly, whether from the platform or on the printed page. His ability as a mechanical engineer is widely recognized. He has been engaged in the design and construction of all sorts of machinery for general and special purposes. In mining and pumping machinery he has had wide experience incident to the peculiar conditions existing on this coast.

While Mr. Scott is known as a practical, "self-made" man, he has found time to inform himself on many topics not immediately connected with his business. He is a man of talent, education and refinement, fond of art and literature, and fostering them in every way. There is no better posted man on industrial matters in the State. He is connected with many organizations in this city, and in all has taken an active interest, so that he has been called upon to serve as director and president of most of those he has joined. The industrial classes of this coast owe to Mr. Scott and his partners in the Union Iron Works a debt of gratitude for building up and maintaining the magnificent enterprise at the Potrero, where between 1000 and 2000 mechanics are constantly employed. Large as these works were when first designed, their scope has gradually been broadened and the interests extended, and it is proper to appose that when further extensions are desirable, they will be made.

For the portrait on this page of Mr. Scott, we are indebted to the *Resources of California*. It was made direct from a photograph a couple of years since, and is a good picture of the subject of this sketch.

THE GILA MONSTER.—At the last meeting of the California Academy of Sciences, Prof. Ward of Rochester, N. Y., described a museum connected with the Coronado Beach hotel, San Diego county. This brought up the subject of the Gila monster, which people thought poisonous, but Dr. Behr stated it was harmless. Prof. Ward agreed with the doctor. His little daughter had one for a plaything for three months before its reputation for fatal biting reached the family. Since then his son has had three healthy Gila hite pigs, chickens, dogs, chipmunka, squirrels, etc., but with the exception of one sick chicken all recovered without any manifestations of distress or inconvenience from the bite.

MR. JOHN L. DOYLE left San Francisco this week for a trip through Oregon, Idaho and Montana in the interests of the MINING AND SCIENTIFIC PRESS. We hope that our friends whom he meets will assist him in his mission and give him such information as he desires.

MECHANICAL PROGRESS.

Wire Netting and Fencing.

The use of wire netting and fencing, embracing all kinds of woven fabric made by twisting wire into meshes, has grown with wonderful rapidity in this country in the past five years. It is by no means a new article of manufacture. It has been in use in Europe for many years. Australia consumes it annually by the thousand miles for sheep-ranches and kangaroo fencing. Prior to 1883 it was imported in considerable quantities into this country from Europe, and strenuous attempts were made to popularize it. At that time it was being manufactured here to a limited extent, the Gilbert & Bennett Manufacturing Company of Georgetown, Connecticut, having embarked in the business some 15 years previously, with machinery for the production of all sizes. The Clinton Wire Cloth Company of Clinton, Mass., and Sedgwick Bros. of Richmond, Ind., also made netting with coarse meshes for a few years prior to 1883, but the development of the business was very slow, owing to the low rate of duty on wire products, which enabled foreign manufacturers to control the trade. In 1883 this duty was changed to harmonize with the tariff on other manufactured products of a similar character, and the whole aspect of the trade was almost immediately altered.

As a result of the enlarged opportunity thus afforded to waiting capital, the number of manufacturers of wire netting has more than doubled within the last ten years. There are now six large establishments in the Atlantic States and one in this city, while the home product has increased fully ten-fold within the past five years. The consumption of such goods has largely broadened, being now used for purposes wholly unanticipated but a short time since.

Moreover, under the sharp competition, the improvements introduced and the fostering influence of an increased tariff, the importation has fallen off, practically to nothing, while the price has been reduced fully one-third. In the manufacture of netting some establishments use galvanized wire, while others galvanize the wire after the fabric is woven, some advantage being claimed by those who use the latter process. The gauges of wire used range from No. 20 to No. 13. The size of the meshes varies according to the use to which the netting is to be put, ranging from one-half inch to five inches. The width of the netting usually made runs from 6 inches to 6 feet. When wider netting is needed for a special purpose, two widths are taken.

The multiplied uses of wire netting is stated by the *Iron Age* as follows: The netting with meshes up to one inch in size is used for making a perforated or open surface on which to spread articles for drying, such as glass, cardboard, printed matter, tobacco, etc. Wire glue netting has completely revolutionized the mode of drying glue. The fine mesh netting is also used for divisions in fish ponds, fish weirs and traps, and to keep birds from building nests around cupolas and the tops of buildings. The netting with $1\frac{1}{2}$ to $1\frac{1}{2}$ inch meshes is used for rabbit fencing, game-inclosures, pigeon-houses, aviaries, park cages, wire partitions between parts of a room, etc. Two-inch meshes are a suitable size for poultry yards, coops, wire trellises, lawn borders, pea or other vine supports, and for inclosing lawn tennis grounds. Coarser meshes are adapted to lawn and garden fencing, and even stock and farm and railroad fencing, being sufficiently strong to turn cattle. The manufacturers of netting for fencing have thoroughly developed its capabilities in this line, and are furnishing gates to correspond with the netting used, together with metal posts. Among the miscellaneous uses to which the various kinds of netting are put can be mentioned office railings, desk railings, wire signs, tree guards, borders for flower beds, croquet ground borders, ornamental summer-houses, etc. It has been used with good effect in large public buildings to prevent an echo, being hung from the ceiling and almost invisible.

So rapidly are the uses multiplying to which netting seems specially adapted, that the manufacturers are excusable for their enthusiasm over it. They look forward to the expansion of their industry to much larger proportions than it has yet attained. In many portions of the country its use has just begun. It is not an article that is used only by farmers and owners of extensive grounds, but its consumption is greatest in thickly-settled districts, and will increase with the growth of the country.

A CURIOUS GERMAN NAIL has recently made its appearance. It very much resembles a wire nail, with the exception that it is square. Like the wire nail, it is of uniform size from head to foot. A correspondent of the *Iron Age* speaks of this nail as follows: "A few days ago I received from Germany a large case of goods. It was rather a serious matter to open it. Crow-bars were necessary, and the only way to get the goods out was by breaking the case into small pieces. The nails were different from any which I have ever seen, and I can bear testimony to their tenacity in holding wood. I send you a handful of these nails as a contribution to your museum of hardware curios. From their peculiar shape one might imagine they were made from old bayonets. They have been a source of much speculation to our carpenters and pat-

tern-makers, who cannot agree as to the way they should be driven with relation to the grain of the wood. One shrewd old fellow, after looking one of these nails over very carefully, remarked that he could not see as it made much more difference about the direction of the grain than it would in cutting a barrel-head out of a board."

Iron or Steel for Ship-Building—Which?

We clip the following from a letter of the regular English correspondent of the *American Manufacturer*:

Evidences are increasing to the minds of our steel-makers and ship-builders and constructive engineers that the more rapid corrosion of steel, as compared with iron, is a fully established fact which is likely to have a more important bearing upon the steel trade than has hitherto been generally supposed. To such a degree is this evidence growing that some of our iron-masters are now putting on more courage regarding the future of their industry in branches where steel has threatened to become supreme than has previously been apparent.

Which is the Best?

It might be fancied that this question had long ago received its answer. But there are those among us who contend that iron is not yet so entirely superseded as had in some circles been imagined. Although almost all the vessels now built are nominally of steel, they yet contain a considerable quantity of iron. The floors, engines and boiler seatings, bulkheads, bunkers, and even deck-plates, are increasingly being composed of the older material. A "steel ship" may, consequently, now contain from one-fifth to one-half of all the metal-work of iron. The more iron is used under the existing conditions the more saving can be effected in the cost of a vessel.

Iron Not Yet Done For.

The thickening of the scantlings, as ordered by the Lloyd's Register, has also to some extent diminished one of the chief advantages claimed for steel ships, namely, their superior lightness and carrying capacity. Certain of the steel-masters on the northeast coast contend that the time is approaching when the shell alone will be of steel, all the other metal-work being of iron. In this expression of opinion my readers must not assume that I am pledging my own view. I am merely recording the views which are finding exponents in circles where ship-building is prominently to the front.

NATURE-SMELTED IRON.—On the North Saskatchewan river in the Northwest Territory of Canada, about 70 miles above the town of Edmonton, Alberta, there is an interesting example of naturally-reduced iron. Along the river bank a lignite formation crops out for several miles, overlaid by clay shales and soft argillaceous sandstones containing nodules of clay ironstones. These nodules are similar to others found at Edmonton, and proved by analysis to be carbonates of iron, containing 34.98 per cent of metallic iron. The Saskatchewan seam of lignite has at some time or other been burnt, leaving a bed of ashes, clinkers and burnt clay, in places 20 feet thick, and now covered by a dense growth of grass and underwood. From this mass of burnt clay pieces of metallic iron can be picked out, weighing in some cases 15 or 20 pounds. They have evidently been reduced from the nodules above mentioned by the heat of the burning lignite. Most of the pieces of iron are much rusted; but when scratched with a file they show a bright surface. The observation is interesting, and to some may help to explain how primitive man originally discovered the reduction of iron ore.

SOFTENING CAST IRON.—A correspondent of the *American Machinist* suggests the following for softening cast iron: "Heat the cast iron to a red heat and quench in water about the same heat, and use the same judgment as you would in quenching a piece of steel, then heat again to a red heat, and allow to cool slowly, the same as you would anneal steel. The above method has given me perfect satisfaction. There may be a difficulty in large pieces, from their liability to crack in quenching, but it will soften them."

LONG TRAMWAY CABLES.—A rope just finished for the Edinburgh Cable Tramway is 17,000 feet long. This is the longest unspliced cable in use in Great Britain, but for the Melbourne (Australia) tramways ropes 20,000 and 26,000 feet in length, and without splicing, have been supplied. The latter weighs 24 tons.

BOATS MADE OF IRON AND STEEL are gradually coming into use on our Western rivers. The largest steel hull boat for the Western river trade was launched a few days ago at DuBuque, and the large iron coal boat recently built at Pittsburg is giving a good account of herself.

CAST IRON will expand and contract between the extreme ranges of temperature in this country with a force equal to $4\frac{1}{2}$ tons per square inch of surface exposed.

WHAT is said to be the only locomotive engine ever constructed wholly in the South, as far as can be learned, has been built in Anniston, Alabama.

SCIENTIFIC PROGRESS.

ILLUSIONS OF SIGHT AND MOTION.—The senses are subject to illusions in proportion to the remoteness of the information that they give from the immediate necessities of the organism. Touch, the most immediate and least inferential of the senses, is least subject to illusions, while sight is so very much so that the blind often say they have an advantage over the seeing in being free from visual illusions. The illusions of bodily motion are much nearer to those of touch than to those of sight, and yet they can under certain conditions be induced through visual impressions. Of this the writer has recently had two interesting examples. He was standing upon the floor of a railroad depot, the boards of which were laid with a considerable open space between them; and the shadow of an electric light was moving up and down by the swinging of the light in the wind. Looking at the floor, it seemed as though the shadow were stationary, and the floor-boards moving. From this it followed that the person on it was moving, too, and the writer distinctly felt the swinging sensation; in fact, his attention was called to the phenomena by the feeling of motion. The other observation was as follows: While riding in the cars and looking out of the window, the trees and all are seen to move in the opposite direction. If, now, one looks in a mirror so situated that it reflects the passing landscape, which, however, must not be visible except in the mirror, one has the illusion of moving in the opposite to the real direction of motion, owing to the reversal of the image in the glass. In both these cases an immediate bodily sensation is induced by a more or less unconscious inference through visual sensations.—*Science*.

COHESION OF LEAD.—It has long been known that perfectly clean surfaces of lead, when pressed together, would adhere to each other with some force. The experiment ranks as one of the classics in simple science. A very good way to show it is with bullets. Small surfaces, flat and clean, are prepared on two bullets by cutting off a little slice with a knife. When pressed together with a wrenching motion, the two will remain attached. A third bullet may now be fastened to one of the pair, and in this way a string of bullets, six or more in length, can be built up. As the phenomenon depends on the absolute cleanness of the surfaces, and as it is a case of adherence of like to like, it is often invoked as an illustration of cohesion. Pure India rubber shows the same tendency, but in a far stronger degree relatively speaking. Whether it is true cohesion or not is uncertain, especially in the case of lead. The method of obtaining this cohesion by employing mechanically prepared surfaces is a far less attractive method than the one which Faraday used in his lectures. He melted the lead and poured it out in two pieces upon a flat stone. After they had cooled, he pressed together the smooth lower surfaces of the lead, and thus obtained strong attachment. The flat plane on which the lead rested gave the essential true surface, while during the cooling it was perfectly protected from oxidation or dust. When lead is thus treated, even the upper surfaces which have been exposed to the air will answer for the experiment.

ECHO-MAKER.—The *Popular Science Monthly* describes a curious and ingenious device called the "Echo-maker," to be used on ships at sea. A flaring funnel is screwed to the muzzles of a rifle. When a supposed obstacle is near the vessel the rifle is fired in its direction, and if the obstacle is there the beam of sound projected through the funnel strikes the obstacle and rebounds, and as the echo is more or less perfect in proportion as the obstacle is more or less paralleled to the ship from which the gun is fired, and as it is near or remote, the position of the obstacle may be inferred. The inventor claims that a sharp sound projected at or nearly at an object, and only when so directed, will in every case return some of the sound sent, so that, theoretically, there will always be an echo, and the difference in the time between the sound sent and the echo will indicate the remoteness of the object. The naval board tried the echo-maker and found that a return sound could be heard from the side of a fort one-half mile away; from passing steamers one-quarter mile off it broadside to; from bluffs and sails of vessels at about the same distance, and from spar buoys 200 yards away.

THE AGE OF THE STARS.—A very interesting address delivered at the annual public session of the five academies of France, October 25, 1887, by M. Janssen, the director of the observatory at Meudon, France, is published in the December number of *Ciel et Terre* and the January and February numbers of *L'Astronomie*. The principal thought is that the idea of evolution may be applied to the stars as well as to terrestrial things. The stars are not fixed and eternal, but are subject to change and time. They have a beginning, a period of activity, a decline, and an end. By recent advances in the study of celestial physics, especially with the spectroscopic, we are enabled to know something of the actual condition and relative age of some of the stars. We may assume that the age of stars, other things being equal, will depend upon their temperature, and that their temperatures are higher in proportion as their spectra are richer in violet rays. The majority

of the stars which are visible to the naked eye are white or bluish, and therefore at a high temperature; but many are yellow or orange, like our sun, showing that they have passed their youth; while others are from dark orange to dark red, showing that their sidereal evolution is far advanced.

SCIENTIFIC AND MECHANICAL PROGRESS.—A Toronto, Canada, paper truthfully says: "After the moral and religious instruction of the family is secured, we know of nothing more interesting and instructive than a record of the progress of modern science and its marvelous achievements." The establishment of journals in all our leading cities of an educational character, devoted to scientific, mechanical and industrial progress, is one of the most hopeful signs of the times. Such journals promote industry, progress, thrift and intelligence wherever they are read, and exert a good, healthy, moral influence in any community which extends to them a liberal patronage. We present this and its sister journal, the *Pacific Rural Press*, as two publications of this character, which are eminently deserving of patronage and of special value to every mechanist, mechanic, manufacturer, engineer, and to the farming and mercantile community as well.

INTERESTING DISCOVERIES IN SPAIN.—Recent explorations in Spain by two Belgian scientists have resulted in some very interesting discoveries. Relics of a prehistoric race have been found in great abundance, ranging from the stone age to that of bronze and metals. These people buried their dead not only in stone graves or cells, but also in great jars of burnt clay, accompanied by pieces of pottery and other articles of use and value. This form of jar burial is very widespread, and examples have been found from Japan to Peru. These relics are supposed to belong to that ancient race which lived in Europe previous to the Aryan immigration, the various branches of which are known as Iberians, Pelasgians, Lignians, etc., according to the country in which they lived. Several skeletons were found adorned with silver and gold ornaments. One of the most remarkable relics is a female skull encircled by a band of silver, to which is attached a thin plate of the same metal.

A CURIOUS PHENOMENON.—A curious illusion of vision has been made the subject of investigation by a French scientist, the result of which, it is thought, may account for the apparent oscillations or swinging of stars sometimes observed; that is, on the eye looking constantly for a considerable period of time at a small, feebly lighted body, itself being in complete darkness, the body appears to oscillate or to describe certain curves. A study of this phenomenon has led to the conclusion that it is of the subjective order, appearing to be, in fact, of the same nature as the movement of a star observed when a person leans his hand against a wall and fixes his eye upon the star, the star appearing to be agitated in its place and to oscillate rapidly. In order that the motion be noticed, there should be no moon, and the sky should be clear.

EXPERIMENTS WITH SOAP-BUBBLES.—At a recent meeting of the Physical Society, London, C. V. Boys described and performed some experiments on soap-bubbles, and by their aid demonstrated in a remarkable manner the phenomena of surface tension, diffusion, and the magnetic properties of gases. By blowing one bubble inside another he showed that there is no electrical force inside a closed conductor. A peculiar property of soap-bubbles is their refusal to come into contact when knocked against each other; they may receive violent shocks and still remain separate. If, however, an electrical body be brought in the vicinity they immediately coalesce. So sensitive are they to electrical attraction that a potential difference due to one Leclanche cell between the two bubbles causes them to unite.

ORIGIN OF ELECTRICITY IN THUNDER STORMS. Investigations made by Sohneke have led to the conclusion that the electricity which is discharged during a thunder-storm is produced by the friction of water and ice—that is, the ice is electrified by friction with water; just before a thunder-storm, water clouds (cumuli) and ice clouds (cirri, cirrostrati) appear simultaneously in the sky, and the friction of these particles of ice and water is, according to this theory, a sufficient cause of the electricity which is generated.

TO FIND THE SUN IN A FOG.—A correspondent writes to the *Boston Journal*: "Reading accounts of so many being lost in the snow and fog, I would call your attention to a simple means of determining the position of the sun at any time of the day, which is by placing the point of a knife-blade or sharp lead pencil on the thumb nail, which will cast a shadow directly from the sun, no matter how thick the snow or fog is. Try it."

A PHOSPHORESCENT GLOW is observed upon cutting into brown sugar which has been oaked in its receptacle, which has been supposed by some to depend upon the phosphorus contained in the boneblack used in refining it. The actual cause of the phosphorescence is, however, unknown, but is an inherent quality of the sugar. Upon breaking the large sugar lozenges sold by druggists the same phenomenon is observed.

GOOD HEALTH.

Care of the Finger-Nails.

One consideration that makes the care of the nails of high importance is the fact that every person who labors with the hands is liable to gather, under their free margin, matter which may be very poisonous. Many cases have occurred in which slight scratches of the skin by means of finger-nails have resulted in malignant and even fatal inflammations.

If, from any cause, the nail becomes thick and inelastic, it soon becomes rough and assumes the appearance of an excrescence rather than an ornament. In this condition it is much more difficult to keep clean. To avoid this the hand should not be subjected to the action of strong alkalies, such as quicklime, etc.; neither should foreign substances be removed from the surface by scraping, as this will usually cause the nail to thicken.

To cleanse the surface and the margin adjoining the skin, a soft nail-brush, mild soap, and soft water should be applied once each day; while the foreign matter accumulated under the margin should be removed as often as the hands are washed, with the use of a hard wood or ivory nail-cleaner.

This being done while the nail is wet, one movement will generally be sufficient to remove the substance completely. A knife-blade is objectionable for this purpose because it scratches or roughens the nail surface.

This paring should also be done while the nail is soft from washing, with an instrument which will make a perfectly smooth edge, and sufficiently often to limit the breadth of the free margin to about one-twelfth of an inch. This breadth is best, especially in the case of persons who have to do rough work with the hands, for two reasons: It prevents the heaving of the nail and also the accumulation of much foreign substance. The corners should not be very closely cut, or the troublesome condition known as an ingrown nail may be produced. To prevent the breaking of the skin near the root of the nail (commonly called "hanging-nail") the skin should be pressed, not scraped, by a dull instrument, back from the nail, once a week.

WHISKY NOT A CURE FOR SNAKE BITE.—Dr. Henry C. Yarrow, whose name is just now prominently before the public as one of the physicians attending General Sheridan, contributes to the *Forest and Stream* a detailed and extremely interesting account of the recent series of experiments conducted by him at the National Museum to discover an antidote for rattlesnake venom. Alcohol in various forms is probably to-day the agent in which the great portion of the people of the world have the utmost confidence as an antidote, a faith unfortunately not well founded if we may believe the many experiments which have been tried. According to Mitchell, it is merely a counteractive agent, a stimulus simply, which may hazy the patient over the prostration produced by the venom, but as a direct antidote it fails, and this is proved by the fact that a mixture of alcohol and venom is no less deadly than the venom itself. It has been claimed that persons in an intoxicated condition, or those habitually indulging in alcoholic liquor, cannot be poisoned by venomous snakes, but abundant proof to the contrary exists, notably in the case of Adam Lake, reported by Dr. Horns in the *North American Medical and Surgical Journal*, 1831, XI, 227. This man had been in the habit of taking from half a pint to a pint of alcoholic liquor daily, and was intoxicated when bitten by a rattlesnake. Notwithstanding the services of excellent physicians, a number of repeated antidotes being used, he died in less than 24 hours.

SALT THE GREAT REGULATING AGENT OF LIFE.—In a recent work by Prof. Burggraaf of Ghent, the prominent theory maintained is that salt is the great regulating agent of life, and on the proper use of which human longevity largely depends. Among the interesting facts recited by Prof. B. is that about the end of the last century a terrible epidemic, bearing some analogy to scurvy, broke out in Saxony, making such rapid progress among the poorer classes that the Government ordered an inquiry into its nature and cause. The result was the establishment of a singular fact, viz., that miners, although reduced to the same misery as other workmen, remained with their families completely exempt from the malady. The diet of the miners differed from the others only in one point, viz., that being employed by the State they were supplied with salt gratuitously. Salt was then prescribed as a curative measure, and the epidemic disappeared.

TO REMOVE TARTAR FROM THE TEETH. Should any little incrustation (tartar) appear on the sides or at the back of the teeth, which illness and very often the constant eating of sweetmeats, fruit, and made dishes containing acids will cause, put a little magnesia on your brush, and after a few applications it will remove it.

DISEASES AND THE SEASONS.—While it appears from the records of English health officers that some diseases have special seasons in which they are most likely to prevail, it is not shown that occasional variations in temperature have much influence in the matter. Scarlet fever is at its minimum from January to May, and at its

maximum in October and November. Diphtheria is more evenly distributed through the year, and is most dangerous a little later than scarlet fever. Measles and whooping-cough seem to be somewhat aggravated by cold weather, but are most fatal in May and June. Hot weather is adverse to smallpox, and favorable to disorders of the bowels, particularly in children.

CAUSE OF COLOR BLINDNESS.—An article in the *Medical Press* advances the idea that the particular defect which gives rise to color-blindness lies not in the eye itself, but in the brain. Certain persons cannot distinguish between two musical tones; yet, as they hear both, the defect is not deafness, or any fault of hearing. Prof. Rimsay, the advocate of the idea, therefore argues that in people who have no musical "ear," the brain is at fault, and assumes that it may be equally true that the inability to perceive certain colors is not due to any defect of sight, but to the mental lack of power in interpreting the impressions conveyed to the brain by the optic nerve. If this be true, the question of color-blindness ceases to be a physical problem, and may be classed among cases for the mental physiologist to deal with.

THE NOSE.—It is said by M. Le Bec, a French savant, that "the nose is gradually losing its power to discharge its traditional function in the case of civilized people; when the sense of small vanities altogether, as will infallibly be the case some day, the organ itself will follow its example sooner or later, as nature never conserves useless organs and the nose must go." The olfactory sense is keener in the savage than in the civilized man. Somebody else declares that the nose is the source of most of our physical woes, this organ being largely responsible for headache, cough, dyspepsia, sarache, neuralgia, hay fever, etc. It may also be added that it is the source of many social troubles, by poking into other people's business. Will the coming man be noseless? Who knows?

A NEW REMEDY FOR NIGHT-SWEATS.—Dr. Sampson Pope, in a communication to the *Therapeutic Gazette*, calls the attention of the profession to an indigenous drug for the relief of night-sweats. He says: "The remedy is one indigenous to the whole country; it is, therefore, within reach of us all. It is the cinquefoil, *potentilla canadensis*, called by some botanists, *potentilla artemisiifolia*. I have etopped night-sweats with it when atropine failed to relieve. It is pleasant to take; when drawn it has an agreeable odor much like table tea. The manner of preparation is to pour boiling water on a handful of the vine, leaves and root. Let the patient drink ad libitum."

USEFUL INFORMATION.

HOW TO USE GLUE.—For glue to be properly effective, remarks the *Scientific American*, it requires to penetrate the pores of the wood; and the more a body of glue penetrates the wood, the more substantial the joint will remain. Glues that take the longest to dry are to be preferred to those that dry quickly, the slow drying being always the strongest, other things being equal. For general use, no method gives such good results as the following: Break the glue up small, put it into an iron kettle, cover the glue with water, and allow it to soak 12 hours. After soaking, boil until done. Then pour it into an air-tight box, leave the cover off until cold, then cover up tight. As glue is required, cut out a portion and melt in the usual way. Expoe no more of the made glue to the atmosphere for any length of time than is necessary, as the atmosphere is very destructive to made glue. Never heat made glue in a pot that is subject to the direct heat of the fire or of a lamp. All such methods of heating cannot be condemned in terms too severe. Do not use thick glue for joints or veneering. In all cases work it well into the wood, in a similar manner to what painters do with paint. Glue both surfaces of your work, except in cases of veneering. Never glue hot wood, as the hot wood will absorb all the water in the glue too suddenly and leave only a small residue.

THE BIRDS TO HAVE A RESPIRE.—Ladies are no longer to wear birds on their bonnets and hats. Thus, says London *Queen*, has it been decreed by fashion. The benevolent edict comes just in time to save the last remaining members of the race of humming-birds and birds of paradise. The great forests of India, Brazil, and the banks of the Mississippi have been ransacked, and have yielded up their treasures of winged jewels to adorn the feminine headgear. Now at last there is to be a truce to the massacre, and the pretty denizens of the woods may sing and fly awhile in peace. To estimate the extent of slaughter perpetrated for the sake of woman-kind's adornment, we may take the statement of a London dealer, who admitted last year he sold 2,000,000 small birds of every possible kind and color, from the soft gray of the wood pigeon to the gem-like splendor of the tropical bird. Even the friendly robin has been immolated to adorn the fashionable bonnet.

THE RABBIT'S LEAP.—When speaking of the distance a rabbit can cover in a single leap, a sportsman writing on the subject says he once measured the spaces cleared by an old Mexican

hare when running in the snow, and found the first two leaps equaled 12 feet each, and the third more than 13 feet, but he never saw that distance exceeded by that species. He says the common rabbit will, when frightened, leap six feet, and on one occasion he measured a jump that was more than seven feet. When moving at an ordinary rate the rabbit jumps about two feet, and the hare rather more than four feet at a single leap.

THE SECRET OF PAINTING CHINAWARE.—Jenny Juco, in the *American Magazine*, says that the present manufacture of porcelain is a comparatively recent industry, and is constantly reaching fresh results. The underglaze treatment of china, for example, was not known here 25 years ago; it was a secret guarded most carefully and confined to a few European and Eastern factories and workers. It was a girl who discovered it—Miss McLaughlin—and now it has become the property of all china decorators. Her success was not alone important to china-painting as an art; it was specially valuable in raising the estimate put upon the work of her own sex, and has perhaps done more than aught else to stimulate to good results the work of women in this branch of industrial art.

NEW METHOD OF SECURING THE FLAP OF AN ENVELOPE.—To secure the flap of an envelope so that it may not be readily opened without betraying the fact that it had been tampered with, has been the ambition of a good many inventors. An envelope constructed as follows is the subject of a recent English patent: The flap is so cut and shaped as to bring the point of it to the top right hand corner of the front side of the envelope, where the gummed surface of the flap secures it to the front of the envelope. The postage stamp is then fixed over the flap so that the envelope cannot possibly be unfastened without destroying the stamp.

TO MAKE PLATINUM ADHERE TO GOLD.—Platinum can be made to adhere to gold by soldering in the following manner: A small quantity of fine or 18 carat gold should be sweated into the surface of the platinum at nearly a white heat, so that the gold shall soak into the face of the platinum. Ordinary solder will then adhere firmly to the face obtained in this manner. Hard solder acts by partially fusing and combining with the surfaces to be joined, and platinum alone will not fuse or combine with any solder at a temperature anything like the fusing point of ordinary gold solder.

NEW PROCESS OF DRAWING.—A process has been perfected and patented for drawing upon wood by means of a fine metallic point kept red-hot, so that the lines are actually burned into the surface. A powerful oxy-hydrogen or other flame keeps the point always at a high temperature, and yet the apparatus is so compact that it may be used with the ease and freedom of a pencil. It is, furthermore, so adjusted as to produce at will all shades of brown, from the lightest to that verging on black.

TO REMOVE OIL SPOTS ON PAPER.—Oil spots on wall-paper caused by persons leaning their heads against the walls may be removed by making a paste of fullers' earth and cold water, and laying some gently on the surface to be cleansed, leaving it until dry, when it may be brushed off, and the spot will have disappeared. It works best on plain paper, but it does not succeed so well on thoroughly colored.

FIRECRACKERS.—It is curious that all attempts to produce firecrackers in this country have failed to secure a home-made article that can compete with the firecrackers from Japan and China. The importation from these two countries this year will amount to 300,000 boxes, an increase of 100,000 over last year's importation.

CURING A SMOKING CHIMNEY.—A profound scientist of the nineteenth century living in Boeton had a smoking chimney in his house. After he had spent \$400 for various devices to cure it, a ragged tramp came along and suggested that he build it six inches higher, which was done and the evil eradicated.—*Detroit Free Press*.

RENOVATING PICTURE FRAMES.—You may improve dingy or rusty gilt picture frames by simply washing them with a small sponge moistened with spirits of wine, or oil of turpentine, the sponge only to be sufficiently wet to take off the dirt and fly marks. They should not be wiped afterward, but left to dry of themselves.

NEW METHOD OF DESTROYING INSECTS.—Moths or any summer-flying insects may be found to destruction by a bright tin pan half filled with kerosene set in a dark corner of the room. Attracted by the bright pan, the moth will meet his death in the kerosene.

THE CORN CANNING BUSINESS.—Eighty corn-canning factories have been in operation this year in Maine, and over 14,000,000 cans of sweet corn have been put up, besides large quantities of apples, beans, tomatoes and other vegetables and fruits.

CALIFORNIA NEWSPAPERS.—California has 520 newspapers and periodicals published within her borders. This is an average of exactly 10 to each county in the State. Pretty good showing for a young State.

Calaveras County Mining Notes.

EDITORS PRESS:—The Albany Flat quartz mine and mill has within the past week changed hands, two of the partners having sold out to Messrs. Hayward & Hobart. These gentlemen are now investing largely in mines and mills both in Tuolumne and Calaveras counties.

This mine has a good strong vein of 8 to 20 feet of high-grade ore which pays from \$25 to \$500 per ton. Some of the rock which the writer saw would go away up in the thousands. As to the permanency of the lead there can be no question, and ere long new works will go up which will give employment to large numbers of men, greatly helping Angels, and adding to the permanent prosperity of the place. New buildings are now in process of construction on the ground.

The Tryon Mine.

At Albany Flat, is now being prospected with most flattering results, the ledge showing similar black spots of ore to the mine just sold to Hayward & Hobart, and which has proved so exceedingly rich.

The Smyth Mine.

At Angels, is now down only 24 feet with the shaft, yet the ore or vein-matter shows solid for six feet in width. This not only shows up a body of high-grade sulphuret, but also contains visible free gold. Very shortly this will prove a most valuable mine; it is not for sale. The owner having stuck to his prospecting for 12 years past, now backs up his judgment by hanging to it and working it himself. He has 100 tons of ore in mill from the Whitell mine, to crush which promises to pay very well. Angels is having an unusual mining boom, this claims all around them paying handsomely. Claims which five years ago could be bought for a few hundred dollars now cannot be touched for as many thousands. Improvements of a permanent character are going up in the town, and it is not presumption to say that within the next five years it will lead any other in the State as a gold-producer.

New mills are going up, and buildings are being built, all pointing to prosperity and success. Such general pay, from low-grade ores with immense ledges to the higher class of small ledges, or those of say three to five feet, the writer has not seen or heard of for years past.

The Union Mine.

Near San Andreas, has again started up the mill under the management of Mr. Ricketts. Twenty stamps out of the 30 are now running. Like most of the mines in this part of the county, the ore is low grade, but with good and ample milling facilities pays expenses with a good margin for profit.

The Irex Mine.

At Rich Gulch, six miles above Mokelumne Hill, has just completed building a new mill of 20 stamps, which is one of the finest and best arranged of any in the State. They expect to be in running order on the 15th of the present month, turning out bullion thereafter.

W. A. K.

Tuolumne County Mines.

EDITORS PRESS:—The Keltz mine has been closed down for some time past owing to lack of funds for needed improvements and proper development. Meantime some vandal (in the absence of a keeper at the mill) broke in and stole a quantity of silver-plated plates. The superintendent, Mr. Sharwood, has offered \$100 reward for the capture of the thief.

The Hyde.

This fine piece of property has been under lease for some time past, but this lease has about expired, and unless some further understanding can be arrived at is likely to close down for awhile. The mine is without doubt a most excellent as well as large one, and can easily be made a large-producing property under good management.

North Star Mine and Mill (Somerville). This property is in charge of and managed by Dr. F. J. Corbett. The mill is now running in good order, and the grade of the ore, we understand, is of a very satisfactory character, yielding an average of about \$15 to \$20 per ton, with ten stamps running.

Experimental Gulch Mine (Columbia). This mine has been bonded to Valentine & Co. of San Francisco, who erected thereon a ten-stamp mill, and after making several runs found it did not pay. Consequently they have given it up. Since then some of the men working for them got out a small lot of rock and put it through the mill, realizing satisfactory results, but the future is not assured.

The Shanghai and Morgan Mines Above Columbia are still dormant, although the owner is considering the placing of a mill on the property in the near future. Mr. Morgan has stuck to these mines for about 20 years past. Such is his confidence in them that he has not only done the work, but also put thousands of dollars in them. The rock certainly shows up exceedingly rich in free gold, and being situated as they are, where abundance of water-power can be obtained easily, should make a valuable property at small cost. W.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLEVELAND.—*Amador Ledger*, July 14: Six miners from Colorado have taken this mine on trial for a month, with the intention of purchasing it at the expiration of that time should the developments prove satisfactory.

MISCELLANEOUS.—The Dane mill is running on some rock from Pioneer district. The Grass Valley gravel claim is proceeding with cleaning up. The water supply is failing fast, and will be barely sufficient to enable them to finish the season's work. An effort is to be made to incorporate the Doyle claim, and to sell enough of the stock to provide working capital to develop the mine. The prevailing opinion is that there is every prospect of this turning out a good mine, and it is hoped the scheme to place it on a working basis will prove successful.

WILDMAN.—Sinking has commenced at the Wildman mine. The dump has been cleaned out and work has been commenced on the solid ground. The calculation is to sink 100 feet and start a drift. As there is a nice little ledge at the bottom now, strong hopes are entertained of an improvement in the new sinking, that will make it one of the best paying mines in the county. The mill will in all probability be kept running during the sinking.

DRYTOWN.—*Cor. Amador Ledger*, July 14: They are still sinking at the Cosmopolitan and everything wears a busy outlook around the property. Teams are engaged in hauling sulphurets from the Keystone and Gover to the reduction works here. They will be able to start up in a couple of weeks. The wood teams are numerous around here hauling wood to the Keystone and Bunker Hill. Mr. Geo. Gates of New Chicago has just completed his new concentrator and got it into successful operation. It promises to surpass anything of the kind now in use for doing rapid and clean work. The sulphurets saved thus far look to be nearly pure.

CLEANUP.—*Amador Dispatch*, July 14: The Goat Shed mine at Pine Grove made a cleanup of 14 tons last week that averaged about \$27 per ton. They are down about 36 feet with the prospect shaft and the ore is improving both in richness and width of ledge as they go down.

Calaveras.

STAR OF INDIA.—*Mountain Echo*, July 11: It is currently reported that the noted Star of India, a quartz mine situated near Smith's Flat, and owned by Curtis & Co., is about to pass into the hands of capitalists. There is an immense body of good milling ore in sight.

ANGELS.—Former residents of Angels who have removed to other parts, and have not seen the old camp for the past three or four years, would be greatly astonished at the wonderful strides it has made in improvements and progress within that period. They would scarcely know the place now. The fact is, however, the town has just commenced to grow, and will, in all probability, loom high above all other mining towns in the mountains within the next three years.

CONFIDENCE.—The furnace at the Confidence mine is completed and the boiler has been placed in position, and the work of putting up the engine will be commenced in a few days. Everything is looking well in the mine and is proving quite satisfactory to the owners.

PLENTY OF MINES.—That many of our valuable mines have already passed into the hands of capitalists is very true, but it is not true—as has been said by some of our wisecracks and would-be mining experts—that there are no mines worthy of notice save those located on what they term the mother lode, which runs through the town. In fact, there was never a greater mistake made, as there are other quartz lodes both east and west of this town, which, if properly developed, are as rich, if not richer, than any of the mines now being worked on this lead. Besides, there are the Carson Hill mines, which are not on this mining belt, and yet they have produced more gold for the amount of labor expended than any other quartz mines in the county. Capitalists who desire to invest their money in mining property, cannot find, anywhere in the country, more desirable sections for that purpose than Angels, Carson Hill, Smith's Flat and Murphys, all of which are situated within a few miles of this town.

Nevada.

A SILVER MINE.—*Tidings*, July 10: Less than two years ago Nevada City mining men were crazy about a reported strike in silver on a property situated 1½ miles south of Banner mountain and owned by the Central Gold and Silver Mill and Mining Co. One "Capt." Channell obtained a 30-day bond of the property and endeavored to enlist Comstock capital in the enterprise, a project Channell did not possess sufficient influence to carry through. Then he claimed that his bond was to endure for a year, and, as the owners had fatuously neglected to keep a copy of the bond, he by his representations kept the property tied up, so at least declared one of the owners to us to-day. Mr. Cooper, who formerly owned a smelting works on Hill's Flat, has a lease of the Central Co.'s property and has shipped several lots of ore to Nevada City and San Francisco for reduction. Thirty dollars a ton—a profitable yield—has been the average return. This ore came from the croppings. A tunnel can be run which will tap the ledge at a point which will furnish several years' work in ore extracting. Below the water level ruby silver is found; above, the metal is carried in black sulphurets. A reduction plant is wanted, for profits are now eaten up by extracting, transportation and other charges, including the working of the ore.

A NEW ENTERPRISE.—*Herald*, July 9: On the Selby Flat side of Manzanita Hill, Jerry Blake has commenced operations for a drift mine. He has started a double compartment shaft, and is now down in the neighborhood of 40 feet. He suspended sinking by hand a few days since for the purpose of putting in pumping and hoisting works. We understand the company doing this work is well fixed financially and is starting for extensive developments. He is now engaged in putting in the ma-

chinery. The pipe to conduct the water is already laid and the water tank is finished. Years ago this ground was rich and there is no doubt much of the same kind yet untouched. These drift mines will yet make this section flourishing.

OMEGA.—The owners of the Omega mine have been for some time working the claim by a hydraulic elevator similar to that used at the North Bloomfield mine. As soon as Scotchman's creek is worked out, the Omega Co. proposes putting in a dam which will hold the tailings from several years' washing. The location is admirably adapted for a dam, which can be built cheaply and so strong that there will be no question about its safety and permanence.

GOOD MINES.—Mr. Aaron, who was in this section a few days since, making observations of the mines in this district, after a visit to the North Banner and Union mines, at Banner Hill, gave it as his opinion that those claims bid fair to make first-class mines. They possess all the requisites, and the formation surrounding them is such that there is almost a certainty of being rich and extensive deposits there.

THE EMANCIPATION MINE.—*Herald*, July 10: The mine known as the Emancipation is located in Willow Valley, near the Deadwood mill. It is owned by Edward Gegan. It consists of three ledges. The one which is now being worked was discovered a few months ago while running a tunnel to strike one of the other ledges. When struck, the owner took out 17 tons of ore which yielded \$495.30, exclusive of sulphurets. There has been another crushing taken out since and it was crushed last week. There were about 20 tons and it yielded \$1623.30, exclusive of sulphurets. The work has all been done within the past two months and mostly by the proprietor himself. By driving from this ledge across to the next, a distance of 153 feet, the owner will strike another ledge in the location, on the croppings of which, 19 years ago, the rock paid \$9 per ton, the ledge being about 18 inches on the surface. The third ledge embraced in this location crosses the second one, and the rock from that paid \$22 per ton 18 years ago, and \$3660 was taken out at that time. The tunnel, when in at that point, will have 140 feet backs. This is a pretty good showing for Nevada district, and shows what is still in store for the energetic prospector.

NO QUICKSILVER.—*Nevada City Herald*, July 12: When passing the Tilton camp, on the Bloomfield road, Mr. Aaron asked for a specimen of the rock being taken out there, and it was given to him by Mr. Tilton. He sent the piece to the State Mining Bureau to see if there were any traces of quicksilver in it. The answer received yesterday was to the effect that it is a very hard quartz, containing oxide of iron, but no quicksilver in any form. Mr. Aaron says if Tilton has quicksilver up there he does not know the kind of rock that contains it, for he selected the piece assayed himself.

THE RAINBOW.—The reported rich strike at the Rainbow mine, at Alleghany, must be correct, as H. K. Noble, one of the plucky owners, who has staid it through thick and thin, went up this morning in response to a telegram announcing the strike. When Noble got busted in stocks he went to the mine and with drill and hammer went to work with his own hands. He has put up money for development work ever since. His persistence is deserving of reward.

OMAHA CONSOLIDATED.—*Tidings*, July 12: In addition to 20 tributaries and contractors, 40 miners are employed at the Omaha Consolidated at day's pay. The ten-stamp mill is now running on company rock of fair grade and it is believed the run will be continuous. This applies to the ore from the Omaha shaft. In Lone Jack shaft the water is being steadily lowered and of course more or less timbering being done. At a point 320 feet from surface two shafts were discovered, but these were found to consolidate at a depth of 420 feet. The water is at present just below this point and the shaft is in very good condition. A week ago a drift to connect the Omaha and Lone Jack shafts was started from the Omaha. This will be 150 feet in length and is calculated to penetrate the Lone Jack at a depth of 400 feet.

Plumas.

DEVELOPMENT WORK.—*Greenview Bulletin*, July 11: The Crescent mine is being worked steadily, and it is reported that satisfactory results are obtained. The Indian Valley runs regularly. Mr. Prentiss gives it his personal supervision. It is understood that the ore is yielding a good profit. Work continues on the Drury, the ore being crushed at the Arcadia mill. The ore body in the mine is simply immense, and is paying. Geo. Standart continues working the Pacific. Fifteen stamps of the Kettle mill have been kept busy, and the ore is supposed to be paying well. At Wolf Creek, development work is progressing. It is intended to put up a mill this fall. The Sunnyside mine is said to be paying well at present, and quite a number of men are employed. On a bar in the river below the Sunnyside mine, a company of Chinese, a few days ago, obtained a nugget weighing 3300. The claim is rich. The Glazier drift mine on the North Fork is paying handsomely. Wm. Roedde and August Goebel are reported to have a rich surface claim on Rush Creek.

San Diego.

SINKING.—*Julian Sentinel*, July 13: On Monday morning work was commenced sinking a shaft at the new Magazine mine, the property of Messrs. J. Marks and S. L. and Duncan Ferguson. At present they have gone down about 11 feet, and good prospects are reported.

HIDDEN TREASURE.—F. M. Carrell, J. M. Parks, G. R. Moore and E. H. Lee are working the Hidden Treasure mine at Banner under lease. They are taking out some very fine rock.

Sierra.

NEW MILLS.—*Sierra Tribune*, July 14: At Scott's Flat, about six miles below Alleghany, parties are engaged in building a 40-stamp mill upon what is known as the Red Chief mine. In the same vicinity another party is putting up two Huntington mills.

STRIKE AT THE RAINBOW.—*Nevada Transcript*, July 14: The town of Alleghany, Sierra county, was wild with excitement Thursday over a strike in the Rainbow mine at Chips Flat. The richest kind of ore is said to have been developed by the new tunnel, which taps the ledge at a much greater depth than it has ever before been worked. The Rainbow has in years gone by produced some of the richest quartz ever extracted from any mine in Cali-

foria, but before attaining a great depth the pay-chute was lost and subsequent operations have been confined to prospecting for it.

MARTIN MINE.—*Nevada City Herald*, July 9: W. G. Benallick & Co. own a very promising quartz ledge about two miles east of Sierra City. It is a north and south ledge; is about seven feet in width and the rock shows free gold throughout. It is heavily charged with iron sulphurets, which bear gold. There is 100 tons of good ore on the dumps. The developments thus far are a shaft 110 feet deep and a tunnel 75 feet in length. The ledge lies between porphyry and slate. Free water for power is abundant, and timber enough for all purposes belongs to the property. Mr. Benallick is superintendent. The location of the mine is such that it can be worked by tunnel for years.

TUNNEL.—*Mountain Messenger*, July 14: H. Lafarie was down from the Pliocene shaft, Tuesday, and reported the pumps in good running order, and the boys blasting merrily away at the new Extension air-line tunnel, in near 2000 feet, with rather tough rock in the face.

ALASKA.—*North San Juan Times*, July 13: The Alaska mine at Pike City is steadily increasing its crew of workmen. Monday last several men passed through our town en route to Pike, from Nevada City and down the ridge. Who said the Alaska was no good?

Siskiyou.

RIVER CLAIMS.—*Yreka Journal*, July 14: The McConnell claim at Klamath river is now being worked with good success, rich pay gravel having been found at both derricks. We hear that gravel hoisted by one of the derricks paid 19 ounces in one day lately. The Centennial Co. has an open cut down nearly 40 feet, or within 15 feet of bedrock, and expect to realize big pay when ready to bottom up. The claim is being worked in the most systematic manner by Marsena Mott, one of the best river miners on the coast. The Chinese Co. working the claim near the Fort Jones claim is taking out big money this season. Another Chinese claim just below the above is also paying well. They took out 100 ounces in a very short time after reaching bedrock lately, a distance of 70 feet from surface of river. This claim pays from 20 feet below surface to bedrock, hence open cuts are more successful than drift mining. The Phil Mott claim, further down on the Klamath, is also being worked with good success. Other river claims are being industriously worked both below and above Humburg creek, on Klamath river, and considerable dust is brought to Yreka every week for general circulation.

QUARTZ.—Messrs. Malow and Allison of Scott valley have discovered a rich ledge of quartz beyond the summit of Humburg mountain, above the old Eliza ledge, which prospects exceedingly well, all the quartz pounded out in a mortar yielding rich pay. The Hamilton Brothers & Humphrey, of Fort Jones, have also discovered a ledge at summit of Humburg, on north fork, which prospects very rich. We learn that a party of prospectors discovered an exceedingly rich quartz ledge in the Siskiyou foothills, last week, between Empire creek, on Klamath river, and Hungry creek.

Trinity.

NEW RIVER.—*Humboldt Standard*, July 7: We have received a visit from John S. Thomson of New River. He tells us that there is a steady flow, exceeding \$10,000 in gold bullion monthly, from this camp, which is handled mostly at the Selby Smelting and Refining Works and Price's assay office, San Francisco. The Uncle Sam mill is running on ore from the mine of the same name and doing custom work. Colgrove & Clement's mill—three stamps—is kept busy on ore from the Excelsior and Mountain Boomer mines. The Thomson & Smith mill—six stamps, double battery—keeps three stamps busy crushing ore from the Carrie mine, and three running on custom work. Sherwood's arrastra is kept at work on ore from the Sherwood mine. The Mountain Boomer mine has cleared up over \$10,000 thus far this season. The ore averages \$80 to the ton. Six men are kept busy working in the mine and an equal number about the mill. The Excelsior has produced over 200 tons of ore this season which averaged \$30 to the ton. The mine has six men employed getting out rock, and there is a good dump now ready for crushing—the mill not being able to work up the rock as fast as it is taken out. Besides these regular producers of bullion, much ore is brought from mines in course of development. Al Campton of Rohnerville has a mine on Pony creek, and has been getting some rich rock worked up at the Thomson-Smith mill. His mine prospects well. A Yocum of Arcata has been having ore from the Little Gem mine worked at the same mill, and it shows well. The Hunter mine, belonging to Clement & Co., has been getting good rock worked at this mill. The mines owned by Billy Mills, Capt. Buhne, D. R. Jones, all Eureka's, have also had good rock worked at the mill. Several other mines are showing splendid prospects, but as yet are only spoken of as outside mines. It is not only New River, but for miles in all directions new prospects are being opened up. Especially is this true on Knownothing creek, 12 miles northwest of New River, where Hansen & Raddelfinger have opened up a mine, and the day our informant left New River, it was reported that Bennett and his partner had found a rich ledge on the opposite side of Knownothing creek, from the mines of Raddelfinger & Hansen. Twenty miles east of New River, on East Fork, Pearson of Junction City is putting in a five-stamp mill to work ore from his mine. Many capitalists and mining experts are in this section looking up good gold prospects. Mr. Thomson says that a careful estimate of the output of bullion from the New River mines shows that over \$2 has been taken out for every \$1 invested in the camp. This is no idle assertion; it can be substantiated by figures.

Tuolumna.

CLOSED.—*Sonora Democrat*, July 14: The Hyde mine is closed down for a time, owing to some disagreement respecting the conditions of the bond, held by Messrs. Spencer and Green. It is expected that the mine will resume work shortly.

GREAT WESTERN.—Messrs. Paul Morf, Eugene Abbott and F. Cullers are opening their mine, the Great Western. It is situated about 15 miles from Sonora in a northeasterly direction and about six miles from Confidence in a westerly direction. The parties are running a tunnel on the lead, and by those who are judges of quartz we are told that it is not at all refractory and that it will yield readily to simple amalgamation process. It is thought the lead

will pay from \$20 to \$25 per ton. It runs obliquely across the country rock, which is slate, and its course will necessarily bring it in contact with other quartz lodes and with feeders.

DUTCH.—Messrs. D. Lucas, Geo. Kattman, James and Chas. Fitzgerald purchased this week a most valuable piece of property at Quartz mountain. It is known as the Dutch mine and is the north end of the Heslep and App mines. Both of these mines coöperate until at last they unite in the above lode.

MILL.—Although the Stanislaus Tunnel & Mining Co. intend erecting large works on the Stanislaus river in the near future, yet they are not going to hastily conclude on the details of machinery. Mr. McCann thinks of furnishing the mill with the new Blanding rock breaker which is giving such general and signal satisfaction.

LEASED.—Messrs. D. W. Cameron and A. A. Grant have leased the lead belonging to Mark Hughes in the southern part of Sonora and are going vigorously at work. The lead is considered one of the best in this district. The lode is, considering its pocket nature, a large one, and is attended with all of the favorable conditions.

PLACERS.—The company which last year made arrangements to work extensive placers below Reynolds' Ferry on the Stanislaus river is now following up the preparations with all possible dispatch. They are building a large wheel, and as soon as the river subsides, which it is now doing rapidly, it will be turned into the long tunnel.

TUTTLETOWN.—*Tuolumne Independent*, July 14: Mr. Fischer is sinking a new shaft on the Leonard mine; it is down 60 feet, and shows a ledge 6 feet wide, prospecting well in free gold. He is using the Ritchie mill to crush the ore. Fred Sutton is working the Grass vein of the Ames mine, crushing the rock at the Patterson. The men who bonded the Long Gulch claim are well satisfied with the fine ore that is coming out.

NEVADA.

Central District.

MILLIONAIRE ORE.—*Silver Star*, July 16: A. H. Ruse sent out about nine tons of second-class ore from the Millionaire mine to J. F. Clark's concentrating works on the Humboldt. It produced nearly half a ton of concentrates which assay \$702 to the ton. The ore carries \$58 per ton in chlorides, which is saved by pan process, besides the concentrates.

Eureka District.

SILVER.—*Eureka Sentinel*, July 14: A streak of rich silver ore has been found in the Alturas mine, on the northern ridge of Prospect mountain, near the Eureka Con. mine. It is said to go 284 ounces per ton. The discovery was made in a shaft about 70 feet below the surface.

Hawthorne District.

THE EVENING STAR.—*Walker Lake Bulletin*, July 11: The present lease of the Evening Star mine will expire on the 18th inst., and the lessees are determined to "make hay while the sun shines." They expect to have between 1200 and 1300 sacks of ore ready for shipment before the lease expires. This will amount to about 70 tons. Frank Thorne, one of the lessees and part owner in the mine, estimates that the rock will mill over \$200 to the ton. This is no wild estimate, but is based upon frequent assays and daily borings. When it is taken into consideration that less than \$7000 has been expended on the mine so far, the result is most cheerful. Six cars have been engaged to transport the rock to the Briggs mill, near Silver City. A representative of California capitalists made a tour of inspection through the mine on Saturday, with a view of purchasing. The owners are not over-anxious to let go, however, as they are satisfied they have one of the best mines in the district.

Lodi District.

GOOD RESULTS.—*Belmont Courier*, July 14: Alfred Welsh continues to work the Illinois mine¹ Lodi, Nye county, with very flattering results. At a distance of 200 feet from the mouth of the tunnel a winze has been sunk 80 feet which has developed an immense body of high-grade ore that will work over \$400 per ton. Four men take out a ton of ore very easily per day. It is smelting ore—carbonate and galena—and is shipped to Reno for treatment. The Silver King—an extension of the Illinois—is being worked by James Graham and A. Farrington. A shaft has been sunk on the ledge to a depth of 114 feet and shows ore in its bottom that assays \$128 in silver and \$19 in gold per ton. A tunnel is being run which will tap the ledge at a depth of over 200 feet. This tunnel is now in 200 feet and the ledge will be cut when it is run about 50 feet further. The indications are considered favorable for a big body of ore. Streaks of mineral are coming in. The chances for a live camp at Lodi are remarkably good.

Seligman District.

PROGRESS.—*Eureka Sentinel*, July 14: We learn that the concentrating works at Seligman are running constantly and successfully, except as to the dust, the separation of the metal from the gangue of which is somewhat tardy. This is merely one of the contingencies that are seldom avoided at the commencement of a new enterprise. Several wells have been sunk at Seligman and the supply of water has been considerably increased. A true vanner concentrator will be set up in the machine-shop for the purpose of treating the dust and handling it with greater expediency. If it proves successful, several more will be added. In the meantime the work of exploration in the Pursell series of mines continues with unabated energy. A large amount of ore is exposed in the tunnels and inclines, those on the Pursell No. 2 mine looking the best at present. Stopping has commenced in good earnest. The working force has been increased to 177 men, besides 22 Chinamen that are employed.

Morey District.

IMPROVEMENT IN THE VEINS.—*Eureka Sentinel*, July 14: We learn that a number of tributaries are at work in the mines of Morey district, Nye county, and we are reliably informed that they never looked better than they do at present. The veins are true fissures, which cross the country in an east and west course, at a distance of about 1000 feet apart. The mountain in which they are situated is very steep and rises precipitously from the foothills. The mines have been opened principally by tunnels entering the foothills and following the veins. The country

rock is granite, which, for a considerable distance along the line of these tunnels, is very much broken up and the veins are displaced at several points, but the tunnels, gaining great depth as they are driven westward into the heart of the mountain, are now entering a more permanent formation, where the veins being consequently undisturbed are likewise showing a more permanent condition as greater depth is attained. Messrs. Moore & Shendel have lately been working the Magnolia mine under lease, and are developing a fine ledge of ore, a part of which is high grade and easy of reduction. They have just completed a shipment of 36 tons to Salt Lake, which, by careful sampling on the dump, shows a value of \$300 to the ton, about \$10 of which is in gold. The low-grade ore, which contains blackjack and is of a rebellious character, is not touched, but the mine, under the conditions of the lease, is kept open, in order that this material can be utilized by the owners at a future day, when it can be mined profitably to under improved facilities. As the saying goes, "blackjack rides a good horse," and the presence of this material is regarded as a good augury.

Taylor District.

CLOSED DOWN.—White Pine News, July 14: Last Saturday morning, under orders from Supt. Carothers, the Argus series of mines were closed down and all hands discharged. The following day Mr. Underhill came up and paid off. The order came unexpected, even to Mr. Underhill, who represents the Eastern owners, or five-eighths of the property. Since the company commenced operations here four years ago they have taken out nearly a million dollars gross, with crust of working appliances and a management more fickle and changeable than the lunar phases. It is true that this vast amount of money was spent in working the property and paying for it, and little, if any, found its way into the owners' pockets. As it is a private company, that always promptly met its obligations, neither the press nor public had any right to criticize its mode of operation, and we have refrained from doing so. The Argus mines after four years' work have been barely scratched, certainly not prospected, and all the indications point to extensive mineral deposits that when economically extracted will keep their mill running for a score of years to come.

Tuscarora District.

NAVAGO QUEEN.—Tuscarora Times-Review, July 14: Northeast drift, 200-foot level, continues to look favorable.

BELLE ISLE.—The slopes are yielding about as usual.

NAVAGO.—The 350-foot level slopes produce their usual amount of ore.

FOUND TREASURE.—Small shipments of ore are being made to reduction works.

DEL MONTE.—No. 2 crosscut north from tunnel drift extended 30 feet, passing through seams of high-grade ore.

NORTH BELLE ISLE.—North drift, 400-foot level, extended to feet; the vein in the face is increasing in width and the ore is very high grade. Everything is running smoothly in and about the mine. The grade for the concentrators is finished and the mechanics have begun on the buildings.

GRAND PRIZE.—Preparations for the extraction of ore, such as timbering, starting chutes, etc., on the 200-foot level drifts, are being pushed as much as possible. Slopes above the 300-foot level are looking and yielding better. A night crew has been put on at the hoisting works to lower the water, and as soon as the winze on the west vein, 300-foot level, is drained, the rich ore left showing in the bottom will be followed on down. Good progress is being made on repairs at the mill.

COMMONWEALTH.—East crosscut from south drift, 100-foot level, has been extended eight feet, passing through a good grade of ore; have not reached the footwall. Intermediate drift from top of No. 8 upraise has been extended six feet, all in high-grade ore assaying \$556 per ton. North intermediate, west of the shaft, is showing extremely rich ore. The east lateral drift, from main south drift, has been extended eight feet, there being four feet of \$200 ore in the face. The mill was started Monday and is doing good work. Battery pulp assay, \$474 per ton.

NEVADA QUEEN.—The 400-foot level of North Belle Isle is within six feet of Queen line. The ore is improving in width, very high grade and carrying a large per cent of gold. The work on the slopes in the 350-foot level is progressing nicely, the ore opening up well—even better and larger than was expected. South drift from bottom of the winze, 90 feet below the 200-foot level, is being cleaned out and put in shape for stoping. The ore is looking well all along the drift and is high grade. The 150-foot level drift from Commonwealth has been extended five feet; the ore is improving. Average assay from car sample of the week—125 tons dumped in North Belle Isle orehouse—\$212 per ton; 200 tons on concentrating dump, \$30.23 per ton.

Washington District.

DE LONG MINE.—Belmont Courier, July 14: It is expected that considerable work will be done in the De Long mine, San Juan canyon, Nye county, this summer. The ore is of a smelting character and can be profitably reduced near to the mine, as wood and water are plentiful and cheap.

ARIZONA.

THE SILVER KING CO.—Silver Belt, July 7: We learn from a reliable source that the affairs of the Silver King Mining Co. are in a serious plight. The company's checks were allowed to go to protest for two successive months, and an arrangement was finally effected whereby the Bank of California takes up the King Co.'s paper and issues its own notes payable several months hence. An assessment, the first, has been levied upon the stock, and shares have declined to \$1. We hope the company's affairs are not so bad as these reports indicate. The Silver King mine is famous, has paid 60 dividends aggregating \$2,000,000, and has always been honestly and intelligently managed, although the management has not escaped the charge of extravagance. The last annual report of the superintendent was very favorable, suggesting large ore reserves. The company has been at heavy expense during the past year for additions to its plant and in exploiting its mine, and it is not improbable—and we certainly

hope such will be the case—that increased ore production and the resumption of dividends will soon follow. The company is now promptly meeting its obligations.

THE OLD GUARD.—Tombstone Epitaph, July 14: The financial embarrassment of the company has been caused in England, where stock subscribed has not been paid for, and is not traceable to the management of the property here nor to the directors, who have ably discharged their duties. We have the assurance of Mr. Williams that every dollar of indebtedness will be paid in a few days and work resumed as per agreement made with him while in London. More than that, when the mill starts up custom ore will be purchased at living prices, and if the business justifies additional stamps they will be immediately added.

A GRAND COPPER PROPERTY.—Florence Enterprise, July 7: A representative of the Enterprise visited the Lake Shore copper mines in Casa Grande district, and he places his views of it in the following language: "Cochise county has her Bisbee and Copper Queen; Gila county has her Old Dominion; but Pinal county can well boast of a copper property that is destined to keep lit her smelter fires for years to come. The Lake Shore is 23 miles from Casa Grande on the Southern Pacific railroad. This property has a large amount of work done on it, and in no instance has a shaft or drift been run but what large bodies of ore have been encountered. The Old Dominion under the greatest disadvantages has proved the life of Gila county, the Copper Queen of Bisbee is upon a career and basis so prosperous that they have raised their workmen's wages from \$3 to \$5.50 and informed their employees that their money could be drawn upon any day that they needed it, and now the mine itself is building a branch railroad to connect with the Southern Pacific road. This itself is a standing manifest to the degree of prosperity which our copper properties will yet advance us. That smelter fires will be kept ablaze by the Lake Shore for years to come is a foregone conclusion; that they have not been ablaze before this must be attributed to the modesty and indifference of the owners, Messrs. Aichison & Traut, who have seemed indifferent whether the outside world were cognizant of this great wealth being in their possession. During the year 1883 \$100,000 cash was asked for this property. There are 1000 tons on the dump and 300,000 tons in sight."

COLORADO.

ORE.—Georgetown Courier, July 12: Sixty-seven cars of ore were shipped from Georgetown during the month of June. A contract has been let for the remainder of the machinery at the Florence tunnel. The entire plant, with buildings, will cost nearly \$15,000. It is expected to have the machinery in operation by the first of August. Mr. Colburn figured up the development on the Sporting Times property a few days ago, and found he had 1362 feet of adits, drifts, winzes, etc., which, together with the patents on the several lodes, has cost him \$14,346. He intends to commence a 60-foot shaft shortly on an eight-inch vein of \$60 ore.

DAKOTA.

LOOKOUT.—Deadwood Pioneer, July 13: As was stated a few days ago in the columns of a Rapid City paper, a fortunate discovery has recently been made in the Lookout, one of the best developed claims in the group owned by the company. The discovery, due in a measure to accident, was made by cutting through some eight or ten feet of barren rock, before supposed to be a wall, but which proved to be a horse, and finding not only that the ore body is much larger than the owners believed, but that this portion of it at least is of much better grade than that on which the mill has been running. Twenty stamps have been dropping for ten days; the other 20 stamps, making 40 in all, were set in motion Tuesday. The mill is run by water-power, and the ore brought to it by a chute, so arranged that a loaded car descending to the mill furnishes motive-power to haul the empty car up the incline to the mine. Everything is conducted on principles of the strictest economy. The total cost for mining and milling is rather under than over \$1 per ton. The ore is said to average, milling test, \$2.12½ per ton. An apparently inexhaustible body is in sight, and the mine promises to prove a bullion-producer for many years to come.

REDUCTION WORKS.—Plans and specifications, expected several days since for the leaching plant, have not yet been received. The reason assigned was unavoidable delay in execution of them, owing to the absence from New York, at the time Messrs. Hickok & Clark reached there, of the pattern-maker at the foundry from which machinery has been ordered. President Franklin, yesterday, however, received a telegram announcing the drawings were at length complete, and that Mr. Hickok would last evening start from New York with them.

IDAHO.

ORO FINO.—Idaho Avalanche, July 7: The Oro Fino Mining Co. is not only pushing work under the superintendency of Mr. M. F. Leech on the Oro Fino and Sinker mines, but also the grading for the 50-stamp mill which will be erected on the east side of town as soon as the grading is completed. A survey for the tramway to run from the Oro Fino mine to the mill at this place is being made. When the tramway shall have been completed, it will be about 1½ miles long. While excavating is being done, and the mill is being built, the company will be developing the mines and extracting ore. At the present time work is progressing rapidly, and good ore is being extracted from the Sinker lode. The Oro Fino Co. has enterprise, and money to back its undertakings, and before the year shall have passed will be shipping bullion weekly from its valuable properties.

STRUCK IT RICH.—The upper crosscut struck the Sullivan & Phillips lode on Tuesday last, and although a sufficient amount of work has not been performed to fully develop the extent of the ore body, it is known to be rich, as specimens shown us fully verify. Drifts will be started each way from where the crosscut intersects the vein, and the mine opened as rapidly as possible.

ORE AND BULLION SHIPMENTS.—Ketchum Key-stone, July 14: The Ramshorn Mining and Smelting Co., at Bayhorse, has shipped through the Ketchum East Freight Line, since May 7th, 13 carloads of

base bullion, weight 438,247 pounds, and one carload of Ramshorn ore, 27,253 pounds, consigned to the Pennsylvania Lead Co. at Mansfield, Pa. A. J. Crook & Co., of Clayton, have shipped during the same time 11 carloads of bullion, weighing 249,463 pounds, and 9 carloads of Skylark ore, 236,805 pounds. Thus the base bullion shipments from Custer county, via Ketchum, in 60 days, were 29 carloads weighing 687,710 pounds, and the total ore shipments, 264,057; total ore and bullion, 951,767 pounds, or about 106,000 pounds per week, all of which has been promptly delivered to the railroad at this point in about that amount weekly. Most of this bullion was on hand when shipping began and consequently the shipments to date have been greatly in excess of the current yield of the works, especially in the case of the Ramshorn Co.

MONTANA.

HELENA SMELTER.—Billings Gazette, July 7: The work on the Helena smelter is progressing with all rapidity, and it is hopefully expected that the great works will be prepared to receive ore by the first of December. About 40 men are now employed on the site and on the various necessary outbuildings, besides 18 teamsters who operate 2-horse teams. Prof. Kahl is superintending the work, but James L. McKay has the operations under his immediate direction. The men are at present engaged in leveling off the ground for the site of the buildings and in the filling and cutting of ground for the line of railroad which is to be used to carry the material to the buildings, and the appearance of the place is one of bustle and business. As soon as the work is far enough advanced, the Northern Pacific proposes to lay an elaborate system of tracks, which will run to and through the buildings.

WEST GRANITE.—Phillipsburg Mail, July 7: In the Butte crosscut the condition is unchanged from last week, with the one exception of there being a little more water than heretofore. The contractors are making a little better progress than for the last two weeks. The tunnel header is now in 795 feet, with the face of the working showing a hard, flinty granite country rock. Work in the east drift on the 100-foot level of the Rattlesnake still continues, with no further indications to report. A crosscut north and south in the drift in the Fraction ground is being talked of in order to thoroughly prospect the country.

HATTA.—From E. D. Holland, who returned last Saturday from Dunkleberg, we learn that the incline shaft on the Hatta will be completed to the old workings in about three weeks. The old drift on the vein will be continued and stoping will follow. The ore is to be shipped to Omaha immediately on extraction. From the same gentleman it is learned that work has been suspended on the Little Joe and Silver Bell claims, lately worked by Scott & Hower.

JEFFERSON COUNTY MINES.—Butte Inter-Mountain, July 14: In the vicinity of Wickes a large amount of activity in mining is being shown. Three new steam hoists are being erected at the present time—one on the Bluebird, owned by Malspugen & Co.; one on the Overland, owned by Gunnersole & Co.; and one by the Boulder Chief Mining Co. The Evening Star, owned by Briscoe & Co., will start up in a short time, as they are now busy getting things in shape. A St. Louis Co. is placing a 60-ton concentrator close by to work custom ores, and this, in connection with having two railroads near, is encouraging the owners of prospects to make a struggle to do something for themselves. The Placer companies at Radersburg are running their giants, while the water season lasts, and from previous records will net good results. In quartz the Keating mine is being worked steadily by two companies. The Toston Co. has the portion owned in former years by Blacker, and John Keating is running his own interest. The ore is mostly shipped to the Toston smelter. A 10-stamp gold-mill is running on some of the ore from near the surface. There is quite a number of very promising prospects on Uncle Johnnie's gulch, some three miles from Radersburg, and considerable development has been done here during the past winter. In the Dogtown mines things are just now at a standstill. The Blackhawk mine has a large amount of high-grade ore sacked and ready for shipment. In the Indian creek district a few men are working in the placers. Wheeler Kimberland and partner have lately struck some very fair pay; \$25 to \$30 to a six-foot set of timbers is not bad. The Little Giant mine that has been worked for the past 18 or 20 years is yet panning out better than wages to the owners. This is certainly one of the most continuous of Montana gold quartz mines. It was always small (from four to eight inches of ore is all they have), but they work it right along year after year. It runs about \$50 a ton. John Murray has a mine on the right-hand fork of Indian creek, called the Iron Mask. He has shipped some very fair ore from it, running about \$100. He has a shaft down 200 feet on this property, and it promises well. Frank Wells of Radersburg has an extension on this same lead called the Lookout, with a shaft 50 feet deep and showing some good ore. A large amount of prospecting is now going on in this vicinity. A Helena company has 12 men at work on a prospect that is not far from the Old Jaw-Bone mill (one of the old-time failures) that shows some very handsome ore. John Murray is cleaning up a very handsome amount from his old Hog Em hydraulic mines. The continued wet weather will give him a good season's water to operate with. The old Iron Age mill on Beaver creek is stamping away on ore averaging \$10. This, with its facilities for working, will net the owners a handsome monthly dividend, and they have quantities of ore in sight.

RICH COPPER SAMPLES.—Helena Herald, July 7: Some rich specimens of copper ore are exhibited in the city by Col. Hawkins, an experienced California miner, whose recent explorations have extended to newly developing mineral districts in Western Montana. The ore samples referred to come from the Home mine in the Bitter Root country. The discovery claim is said to show a vein nine feet in width. Col. Hawkins, in his discoveries, has also uncovered very promising veins of galena and gold ores. He is in Helena, having assays made of the samples he bears with him.

SYDNEY CON.—The work of pumping out the mine is still going on with success. Supt. Gable gives it as his opinion that by the first of the week three shifts of men will be employed and at work sinking the shaft.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JULY 10, 1888.

385,985.—STATION INDICATOR—Mark Anthony, S. F.
385,696.—CHURN—J. C. Cole, Brents, W. T.
385,793.—LATHIE CHUCK ATTACHMENT—Findlay Cumming, S. F.
385,701.—RAILWAY RAIL—F. Euphrat, S. F.
385,859.—CEMENT—I. C. Hatch, Santa Cruz, Cal.
385,812.—DREDGER—Knight & Lambing, Sutter Creek, Cal.
385,936.—DENTAL ENGINE—W. A. Knowles, Alameda, Cal.
386,024.—CAR BRAKE—L. Nicholson, S. F.
385,780.—INSTRUMENT FOR PLOTTING CONTOURS OF GROUND—M. Sturud, Seattle, W. T.
386,046.—LAMP SHADE—Genevieve Watson, Seattle, W. T.
386,049.—RAILWAY SIGNAL—G. H. Wright, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DREDGING MACHINE.—Samuel N. Knight, Sutter Creek, and Isaac P. Lambing, Ione, Amador county. No. 385,759. Dated July 10, 1888. This patent covers an improved dredging bucket and mechanism for opening and closing the same. It is intended to be applied to the machine illustrated in the MINING AND SCIENTIFIC PRESS of July 14, 1888, for deep-creek and river-bed mining. This bucket is very strong and is operated by steam. When closed the bucket forms a nearly tight and perfect hemisphere, and the whole apparatus, with its load, is lifted by the crane and transported over the dump. By constructing the bucket-sections of the hemispherical form and with the sharp points, their effectiveness in digging the material is very great.

LATHIE-CHUCK AND ATTACHMENT FOR TURNING TREENAILS.—Findlay Cumming, S. F. No. 385,793. Dated July 10, 1888. In the turning of treenails or similar articles in which it is desirable to do the work expeditiously, considerable delay occurs because it is necessary to stop the lathe after each one is finished and remove it and place a new one in to be turned, after which the lathe must be started. This invention consists of a chuck by which the square pieces from which the treenails are turned can be instantly seized and released while the lathe is in motion, and an adjustable traveling cutter by which the square stripe are turned into cylindrical form, with the exception of the head, which is held in the chuck, said cutter being self-adjusting, so as to adapt itself to strips, which may be warped or not, perfectly straight.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Confidence, 16, \$18,183; total to date on July account, \$36,282; Oest, 15, \$12,000; Iron Mountain, 6, \$16,000; Mt. Diablo, 14, \$8347; Blue Bird, 14, \$46,336; Pollock, 14, \$8896; Lexington, 14, \$24,336; Moulton, 14, \$11,120; Hanauer, 12, \$2500; Germania, 12, \$2279; Hanauer, 13, \$1800; Pollock, 10, \$9040; Cons. California and Virginia, 14, \$68,806; Richmond Oons., 14, \$17,739; Eureka Cons., 14, \$12,730; Hale and Norcross, total for June, \$149,365. Last week the shipments from Salt Lake were as follows: Welle, Fargo & Co., \$82,140; McCormick & Co., \$34,780; T. R. Jones & Co., \$16,728.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco: OCCIDENTAL CONSTRUCTION CO., July 14. Object, to build, maintain and operate gas, electrical and water works. Directors—L. L. Bromwell, General W. Lynch, John D. Yost, H. Wadsworth and M. S. Newell.

MUSSEL SHOUGH CANAL CO., July 14. Capital stock, \$200,000. Object, acquiring and selling water rights and operating canals for irrigation purposes. Directors—Charles L. Lind, George H. Malter, William H. Jordan, Franklin P. Bull and Lee W. Mix.

THE EDUCATIONAL CONVENTION.—San Francisco has received several thousand visitors this week, who are in attendance on the National Educational Convention. These teachers come from all parts of the United States, and many of them will spend several weeks in California visiting the different points of interest.

ORE CRUSHER

Sectional View of Pulverizer.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

H. W. JOHNS' ASBESTOS PACK-
ING, PAINT, ETC.**— THE —
DOUBLE "ECONOMIC" STAMP MILL.**

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**JAMES LEFFEL'S
Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Glohe Cases, free of cost, by applying to the manufacturers.

Mining Share Market.

Mining stocks have been inactive, the only topic of interest being the contest at the Savage election on Thursday afternoon. This takes place too near the hour of going to press for us to report the result. Up on the Comstock changes are being made at the California battery and pan mill in the manner of transmitting power from the Pelton wheels in the Com. C. shaft. The surface wheel, which was at the mouth of the shaft, has been taken down, and is being set up at the battery-mill. The water-pipe which supplies it with propelling power will now come from the side of the mountain and course around direct to the battery-mill. After the water passes the wheel it will pass to a winze and be caught in a tank. It will then be taken by a large pipe, led down the winze 660 feet through the Latsrobs to the shaft, and then go to the 500-level as formerly, and then to the 1000 and 500 levels. The changes in the shaft are insignificant, being only that the power from each wheel will be aggregated on the surface-shaft independently of one another.

Placing a Pelton wheel at the mill, lands 95 per cent of its power on the tools and does away with wire ropes. It will also enable the mill to run when cleaning-up is going on at the pan-mill—a big advantage.

On the surface, transmission of power will be exactly as formerly, but its distribution at the mill will be quite different.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Platform Scales, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises is an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPIE & CHILDS 123 California street, San Francisco.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

R. J. ELAM, a mining operator well known in Utah and Nevada, was drowned in Salt Lake on Wednesday, while bathing.

THE mining town of Calico, San Bernardino county, has again been visited by a serious fire.

San Francisco, Cal.

KELLY'S NEW CYLINDER.

Patented Sept. 25, 1886.

TO PUMP MANUFACTURERS:

We invite your special attention to our new

Double-Acting Submerged Cylinder for Deep Wells.

The accompanying cut illustrates the cylinder and its working parts, which is very simple in its construction and not liable to get out of order.

We are now offering for sale the entire patent, either by State Rights or as a whole, at amazingly low figures considering the actual worth of such an article. Parties desiring to purchase territory may reap the benefit of our lowest possible terms.

For a full and complete description and prices of the same, address

KELLY BROTHERS,

1728 Twelfth Avenue, EAST OAKLAND, CAL.

THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruires, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

MARSHUTZ & CANTRELL.

THE RAND DRILL COMPANY,

28 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double ca-

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

A. T. DEWEY } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED
W. B. EWER. 1860
GEO. H. STRONG.

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies the information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

No. 119 Beale St., - - San Francisco**

—BUILDER OF—
Steam Engines, Flour Mill,
Mining, Saw Mill and
Dredging Machines
Brodie Rock Crushers,
Steam Power, Hydraulic,
Slide Walk and Hand-Power
ELEVATORS.

Manufacturers of B. E. Henrickson's Patent Automatic Safety Catches for Elevators. All kinds of machinery made and repaired. **ORDERS SOLICITED.**

**UNION IRON WORKS,
SACRAMENTO, CAL.**

ROOT, NEILSON & CO.,

MANUFACTURERS OF

**Steam Engines, Boilers,
AND ALL KINDS OF
MACHINERY FOR MINING PURPOSES.**

Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.
Front St., bet. N & O Sts., Sacramento, Cal.

Golden State & Miners Iron Works.

Manufacture Iron Castings and Machinery of all kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

THOMAS THOMPSON THORNTON THOMPSON

THOMPSON BROTHERS,

EUREKA FOUNDRY,

129 and 131 Beale St., between Mission and Howard, S. F.

MANUFACTURERS OF CASTINGS OF EVERY DESCRIPTION.

G. K. ORTON. J. H. WILLIAMS.

**Williams & Orton,
MANUFACTURERS OF GENERAL MACHINERY.
Works, No. 315 Mission St., San Francisco.
Special attention given to Woodworking Machinery,
Steam and Gas Engines. Correspondence solicited.**

MINING ENGINEERS.

**N. S. KEITH,
ELECTRICAL ENGINEER,**

Inventor and Manufacturer of

**KEITH'S ELECTRIC DYNAMOS, MOTORS,
LAMPS, STORAGE-BATTERIES, Etc.**

Contractor for the Construction of ELECTRIC RAILWAYS

—AND—
Plants for the Transmission and Distribution of Power by Means of Electricity.

Send for Circulars giving particulars.
Office, 40 Nevada Block, San Francisco, Cal.
Factory, 11 & 23 Stevenson St.

**ISRAEL W. KNOX,
Mining and Mechanical Engineer**

AND PURCHASING AGENT FOR

Mines, Mining Machinery & Supplies.

Mines Examined, Reports and Estimates Furnished. Contracts made, etc.
Office, 237 First St., San Francisco, Cal.

**SCHOOL OF
Practical, Civil, Mechanical and
Mining Engineering,**

Surveying, Architecture, Drawing and Assaying,
723 Market Street,
The History Building, SAN FRANCISCO.

A. VAN DER NAILLEN, President.
Assaying of Ores, \$25; Bullion and Chlorination Assay, \$25; Blowpipe Assay, \$10 Full course of assaying, \$50. Send for circular.

**W. A. GOODYEAR,
Civil and Mining Engineer,
MINING EXPERT AND GEOLOGIST.
Address "Business Box A," office of this paper, San Francisco.**

**ROSS E. BROWNE,
Mining and Hydraulic Engineer,
No. 307 Sansome St., SAN FRANCISCO.**

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1870; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

**ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7, No. 109 California Street, SAN FRANCISCO, CAL.**

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

**JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 Fremont St., San Francisco, Cal.**

COMPRESSED AIR and WATER POWER MACHINERY.

RIX & FIRTH, 225 and 227 First St., San Francisco.

NATIONAL AIR COMPRESSORS.

SINGLE OR DUPLEX, STEAM OR BELT POWER.
62 Sold on the Pacific Coast.

**KNIGHT'S WATER WHEEL,
—FOR—
MILLS, PUMPING AND HOISTING.**
Over 300 in use. All estimates guaranteed. Send for Circular.

MINERS' HORSE WHIM.

All wrought iron. No gears, no breakage. One horse will easily handle rock or water to a depth of 50 feet, giving entire satisfaction to the prospector. Price, complete, \$200. 150 sold on this Coast.

NATIONAL ROCK DRILL.
200 Sold on this Coast. Has less repairs than any other Drill.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER.
FULL WEIGHT OF SILVER AND BEST QUALITY OF WORK GUARANTEED.

GET OUR PRICES BEFORE ORDERING ELSEWHERE. SAMPLES FURNISHED ON APPLICATION.

**SAN FRANCISCO NOVELTY AND PLATING WORKS,
No. 108 FIRST STREET.**

NOTICE.—All our plates are guaranteed to have the full weight of silver agreed upon, and are tested before leaving our works, thereby avoiding the complaints about light weight, made so often before we started in this branch of industry.

**JUSTINIAN CAIRE, Agent,
521 & 523 Market St., San Francisco,**

—DEALER IN—

Assayers' and Mining Material.

—MANUFACTURER OF—

BATTERY SCREENS AND WIRE CLOTH

Agent for HOSKINS' HYDRO-CARBON ASSAY FURNACES

ATTENTION, GOLD MINERS!

WE ARE SELLING

Silver-Plated Amalgamating Plates For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Our Silver Plated Plates have always proved as represented. We have been manufacturing them for 20 years, and use only the best Lake Superior Copper and Refined Silver. Comparing our plates with those of other manufacturers, after repeated tests, we can safely guarantee much better plates for the same money. Our plates are used by all the prominent mining men on the Pacific Coast. SEND FOR CIRCULAR.

R. S. MOORE, Superintendent.

L. R. MEAD, Secretary.

RISDON IRON & LOCOMOTIVE WORKS

Location of Works, S. E. Cor. Beale and Howard Sts., San Francisco.

Manufacturers and Sole Agents for the Pacific Coast for

HEINE SAFETY WATER TUBE BOILER.

Has the Following Advantages:

**SAFETY,
DURABILITY,
ECONOMY,**
AND FACILITY OF INSPECTION and REPAIRS.
60,000 Horse Power now in use.

Boilers can be seen working in San Francisco at Palace Hotel, Spring Valley Water Works Hueter Bros. & Co., California Jute Mills, and other places.

Guaranteed More Efficient than any other Boiler made.

BUILDERS OF

QUARTZ MILLS—Gold and Silver, Copper and Lead Smelting Works, Roasting Furnaces of all kinds.
AIR COMPRESSORS—Rope Power Transmission.
HYDRAULIC PUMPING and Hoisting Machinery.
WROUGHT-IRON WATER PIPE a Specialty. Note.—Have just completed order for 35 miles of 44-inch pipe of 4-inch iron for Spring Valley Water Works Company, San Francisco.
SAW-MILL MACHINERY of all kinds.
STEAM ENGINES—Corliss, Slide-Valve, Poppet Valve Automatic, Single, and Compound.
SOLE MANUFACTURERS for Pacific Coast of the Celebrated "Heine" Patent Safety Boiler (Water Tube); 50,000 horse power now in use.
MACBETH PATENT STEEL-RIM PULLEYS—Fifty per cent lighter and 25 per cent cheaper than cast-iron pulleys; will not break in transportation.

REFRIGERATING MACHINERY for Steamships, Breweries, and Cellars.

WILSON'S PATENT GAS-PRODUCER.

STEAM BOILERS of all descriptions.

SUGAR MACHINERY—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.

STEAMSHIPS—Steam Yachts, Marine Engines and Boilers, Screw Propellers, Centrifugal Pumps, Steamship Pumps, Steam Capstans, Cargo Winches, etc.

Builders of 120-stamp Gold Mill for the Alaska Mill and Mining Company; 80-stamp Mill for Quartz Mountain Mining Company.

Send for Circular and Price Lists.

Cable Railroads.

In this city, where cable roads originated and where we have had the greatest experience with cables, there are no electric roads, though several experiments have been made. We are building more cable roads than ever in San Francisco. The Market-street system is running 21 hours a day, with cars 40 seconds apart, doing its work cheaply and regularly, with no

property. The convenience of frequent and rapid transit attracts people to those localities where there are cable roads. It is a proof that they are good properties when so much new road is being built in the city where cables have been known the longest.

THE ECLIPSE.—The total eclipse of the moon which occurred on Sunday night was not observed in this city or Oakland, owing to the pre-

The Cogswell Polytechnic College.

The first session of the Cogswell Polytechnic College will open for the reception of students Monday, August 6, 1888.

The object of this institution is not to teach trades, but to prepare students to enter successfully upon any line of useful work. The aim is to fully develop the boy and girl mentally, morally and physically, thereby producing

porch. On each side of the door is a niche for the placing of pieces of statuary. There are also two side entrances—one for boys and the other for girls. The main entrance porch is approached by a broad flight of stone steps. The main hallway is 10 feet wide, and opens into a cross-hallway 12 feet wide, which crosses the building from end to end. From the cross-hall, stairways lead to the second story; stairs also lead to the stage at the rear and to the

COGSWELL POLYTECHNIC COLLEGE, SAN FRANCISCO.

serious stops or breaks. The Olay street, Sutter street, Presidio, California street, McAllister street, Geary street, Powell street, Haight street, Hayes street, Castro street, Larkin street, and all the main and branch lines work successfully day and night, winter and summer. A four-mile double track is being put down on Howard street, and two miles on Fell and Oak streets to the park. On Clay and Sacramento streets 11,000 feet of track is being put down as a branch to the Powell-street road. It will not be long before another cross-town road will be built on Third, Montgomery and connecting streets. The city will soon be a network of cable roads.

While the first cost of these cable roads is large as compared with horse-car or motor lines, they are so built as to need little repair, and immense traffic can be maintained. The cable roads pay well, and, wherever built, have resulted in enhancing the value of contiguous

vailing fog. At Mount Hamilton, however, they had an excellent night for observing. Prof. Holden and Messrs. Schaeberle, Keeler, Barnard and Hill were all engaged in the observation, and the work will shortly be reduced and discussed. Forty-seven drawings were made at the telescope, and 11 with the naked eye.

ANTHONY CLARK, the veteran miner of Forest Hill, says the Dardanellas mine, with a ten-stamp mill, is good for \$20,000 a month. At present there are only five stamps, and they are not run right along on account of scarcity of water. Last week the cleanup amounted to \$2600, although the mill was not run all the week. This would be an average of more than \$10 to the carload.

JOHN HAYS HAMMOND, M. E., has gone to inspect a mine about 100 miles south of the City of Mexico.

self-reliant and self-helpful men and women. The school and building are the result of a donation of \$1,000,000 by Dr. Henry D. Cogswell, and the college is located at the corner of 26th and Folsom streets in this city.

The building is three stories high, and from its imposing and substantial appearance is the most notable structure in the southwestern portion of the city. It is 71 feet in width by 85 feet in depth, not including the projections. On each side there is a wing two stories in height, each 35x40 feet. The building is surmounted with a high roof, covered with ornamental metal Queen Anne shingles, and has a handsome cresting on the ridges. In front a high tower rises to a height of 127 feet, the apex topped with a revolving crystal star set in a copper pinnacle. On the face of the tower, above the third-story line, is the dial of a clock, and still lower down the name of the school. The main entrance is spacious and surrounded by a wide

front of the assembly hall, in the story above. It will thus be seen that the means of egress are unusually excellent, there being three wide doorways from the ground floor to the street and two from the second story to the assembly hall.

HEALTH OFFICER BARGER states that the quarantine station at this port, for which \$103,000 has just been appropriated, will be located on Angel island, and constructed under the supervision of the Marine Hospital service. The appropriation will probably be disbursed in part as follows: Disinfecting machinery, \$20,000; warehouse and wharf, \$1000; steam tug, \$30,000; small boats, \$1000; hospital buildings, \$24,000, and annual expenses, \$18,000.

In many of the mines of Butte, M. T., the system of payment has been changed from pay by the day to the contract system of payment per car of producing ore.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

A Miner's View of Geology.

EDITORS PRESS:—Mythology is responsible for a great many foolish ideas taught in our high schools about geology and astronomy. Very different is a miner's view of geology, as demonstrated by chemical and microscopical analysis, and practically applied in the field by topographical and underground explorations. When our standard works on geology teach the igneous formation theory, and that the world inside is a molten mass of liquid heat, it is misleading. When they teach that the aqueous formation is subsequent to the igneous, it is misleading, etc. In tracing back to find what the human family were about the beginning of the world, I soon found myself in Hindostan. They had a mythology with a Board of Gods, all having some creative ability. Buddha, about 600 years B. C., gave a good code of moral laws, and his gods made the world and were not very particular what they made it of. The next place I found myself was in China. I found things developing there from way back, but coming on up to Confucius' time. They had a mythology with a code of moral laws very good, and their god had some business system, for each god had his constructive department allotted to him. They jointly made the world, but did not classify the material used in the construction. Now I passed over into Egypt and found Moses and his mythology. He had a wide-awake God that headed anything prior to his time. This God made everything—the world and our solar system—Himself, with no help; but He did not tell Moses what He made all these things of, so I found it was left for the human family to find out the material used in the construction of the earth.

I find they commenced by noticing the debris, coming down from higher elevations, and forming what we call soil. This they settled upon as a water formation—aqueous. Next they noticed red-hot lava coming out of volcanic craters. This led them to believe that the inside of the earth was a molten liquid mass of lava, and from this molten mass rocks were formed. These are classed as igneous rocks. This idea is taught in all our high schools throughout the civilized portion of the world up to date, coupled with Moses' mythology and his God. Great effort has been made to make geology agree with Moses' mythology.

Later on another element came in—astronomy. Science has developed that there is unity between geology and astronomy, and they both declare war against Moses' mythology and that of all other nations.

There is no question in my mind about this fight. All mythology has got to surrender and be wiped out from the human mind.

Now we come to a period of record where theories and facts are compiled and preserved for future analysis, coming up to our present age. We have chemicals and appliances that enable us to analyze and microscopically examine any substance. The result of this work shows us that every known substance is a compound, and the primitive parts are in a gaseous, liquid or aqueous solution. One part has an affinity for a second; the first and second united make an affinity for a third part, and so on, forming all substances by affinities. The granites and trap families are classed by the old standard as igneous rocks. Analysis shows us just what the compounds are. The two principal compounds are silicates of magnesia and silicates of alumina. Other compounds are silicates of potash, soda, lime, iron and manganese, that make up the compounds of all classes of rocks. By acid all these properties are held in solution in boiling water (a heat as low as 212 degrees). When our science has advanced to this perfection, we can demonstrate these facts to a certainty.

Can any man who has followed mining for a business practically say that granite is not formed from aqueous solutions? We have classed rocks down to four grand divisions, thus: Igneous, aqueous, aerial and metamorphic. These terms are all right except when misapplied. Igneous should apply to lava—anything produced from a molten mass. Aqueous applies to mechanically, chemically and originally formed soil or rock. Aerial applies to debris and dust deposits from currents of air. Metamorphic applies to argillaceous, calcareous and cretaceous formations. This fourth division includes all rocks mechanically, chemically and originally formed from aqueous and acid solutions. This division takes in all quartz, feldspar, basalt, trap and the granite family, that the old standard claims to be igneous rocks. For the igneous theorist I will state that we claim no heat higher than boiling water and acid in solutions for aqueous formations of all rocks; and that there are no igneous rocks or formations except those formed from the melting of the original aqueous rocks or clay; and there is no heat coming from the earth but that coming from chemical decomposition of the deep aqueous formations that were once at the surface. Now, when we go among the human family to find the origin of aqueous rocks, we find no authority higher than Moses' mythology and his God. When we go into chemical analysis, we find there is no compound of mineral or vegetable matter, but their elements are found in our atmosphere.

I ask all mining men to apply this aqueous-

solution theory to all their explorations, and study the affinity of minerals and the primitive compounds that form them. Geology has just commenced assuming its independence of mythology, and the same of its sister science, astronomy. The two sciences combined will soon be able to shame mythology, until it will have no existence in the human mind. What the new era that is coming in will require, will be demonstrated facts, and will be satisfied with nothing short of that.

MINER.

Como, Nevada.

EDITORS PRESS:—As we said in our last, "If we continue to increase and prosper, you should hear from us again," and since those conditions prevail, we must make our promise good.

Our population is now about 35. We were patriotic enough to remember the Fourth, and spent about \$30 in celebrating. Our fireworks were seen in Virginia City, a distance of 20 miles.

Our weather is delightfully cool and pleasant to-day, July 11th—62°. Highest temperature for the season thus far, 92°, and that only one day.

This is an old camp, and was first prospected and worked about 1861. The palmiest days were from '61 to '65, when the town of Como contained about 500 inhabitants. Thousands of dollars have been squandered here in prospecting, running tunnels, sinking shafts, etc., but always stopping before going far enough to develop anything. The deepest shaft is not over 250 feet, but considerable ore has been taken out from near the surface in different places, and all mining experts who have ever visited the district are agreed that the surface indications point to the fact that a bonanza must exist here somewhere, and they all think it will be found when sufficient depth has been attained. Very rich free milling ore has been recently discovered in the Buckeye at about 100 feet, but in what quantity has not yet been determined.

The only mine in the district upon which active operations are being carried on at present is the Eureka Como, but there is talk of commencing operations on two or three others in the camp, soon.

The Eureka Co. are going ahead with their development work as fast as possible and will soon have their shaft down to the 300-foot level, from which they may run a drift to tap a 10-foot ledge which is known to exist, and from which quantities of good paying ore have been taken above the 200 level. They have machinery sufficient to sink to a depth of 600 feet. This mine may be the means of developing the whole district.

A heavy growth of nut pine once covered this country, but during the last 25 years it has all been cut and hauled away, until to-day not even the stumps remain to tell where a forest once stood. It is said that Uncle Sam has been robbed of at least \$3,000,000 worth of wood in this district alone. There is now a sparse growth of young pines springing up all over the hills which might amount to something within the next century if let alone. The scarcity of wood will be the most serious drawback to extensive mining operations in this district, provided rich strikes are made here. CHROMO.

Como, Nevada, July 20th.

El Dorado County Mines.

EDITORS PRESS:—The Davidson mine, at Shingle Springs, is still idle, although a most excellent property. This is owing to a want of funds to work it since the mill was burnt down.

The mills of the following mines are all shot down at present, viz.: The Con. California, El Dorado, Crystal, Oro Fino, Volante and Crane, all in the vicinity of Shingle Springs; also the Mt. Pleasant, Morey and Melton, near Grizzly Flat.

The Josephine mine, Volcanoville, above Georgetown, is now erecting a new 20-stamp mill, most of the machinery having reached Georgetown. The whole is under the superintendence of Jos. M. Nonges, a San Francisco attorney.

The Zentgraf mine, at Wild Goose Flat, is being worked and the ore being milled by the Zentgraf Bros. is yielding very satisfactorily.

The Grand Victory mine, three miles above Diamond Springs, on the old emigrant road, at Squaw Hollow, is one of extreme proportions, having been worked some 250 feet in width and about 200 feet in depth. It is a quarry of porphyry, containing gold. All the ore taken out has been put through the 50-stamp mill. The material was very low grade, yet always paid with a profit, as it required but a few men to do the whole. The mill is now closed down.

The Gopher Boulder mine, near Kelsey's, is now owned by Geo. Cullen Pearson of London, England, who is now on his way here to commence active operations. The foreman in charge has a force of men at work preparing. The company is about to introduce electricity as a motive-power by transmission from their dynamo driven by water-power. By this method not only all their machinery will be driven for hoisting and milling, but it is also their intention to supply Placerville and Georgetown with electric lights from the same source. This mine is directly on the "mother lode," and is an immense ledge, carrying at times

quite a percentage of sulphurets of good quality. This undertaking will require not only a force of men, but also a large expenditure of capital.

The Taylor mine, near Georgetown, in Garden valley, is running ten stamps. This mine is paying handsomely and giving entire satisfaction in its results. It is in charge of Mr. Chesley as superintendent.

The Alpine mine and mill is located about three miles from Georgetown. It is owned by the Walker Bros. of Salt Lake, and is under the management of J. H. Morton, supt. The mill is a new one of 10 stamps, but unfortunately is not built as solidly as it should be, and certain defects now existing should be remedied. The mine in my opinion is a good one, and will pay if the ore is properly milled.

The owner of the Esperanza mine is a working man who has spent some years past on the property preparing to tie it to the end, knowing he has one of the best in the county. Although of low grade, the ore body is of a width of 52 feet in the bottom of shaft. Preparations are now in progress by which work will be resumed in sinking immediately, as the present hoisting works will do to go down to a depth of 500 feet.

The Church Union mine after having been worked for the past 25 years to a depth of 1700 feet, has finally been shut down by the owners, Messrs. Hayward and Hohart. Not because it would not pay, as the last winze sunk below that level shows better ore than ever. Nevertheless the mine has been stripped of the hoisting works, engine, boilers, mill-stamps and all the appurtenances, a part of which is being transported to Angels camp, and the balance to the Dead Horse mine in Tuolumne county, both of which are new purchases by the above gentlemen. Various are the surmises as to whether this mine is to be closed for good or whether on account of insufficiency of machinery to operate to a greater depth in the future. Anyway, it is to be regretted, as it creates a stagnation in this part of the county which will be severely felt. K.

Two Shafts in Mines.

EDITORS PRESS:—In your paper of date 7th inst., I found a short and sensible article headed "Two Shafts." The item is, however, erroneous to this extent: it was written under the idea that we had no law in this State upon that subject, but we have, as you will find in Stats. 1871-72, p. 413. It is true its provisions are applicable only where shafts have been sunk to the depth of 300 feet, and 12 or more men are employed daily.

It was the best we could do at the time, for mine owners fought the proposition all the time, and defeated the bill at the previous session, notably the opposition coming from the leading miners in Nevada and Amador counties.

I drew the first bill (session of 1869-70) for Sam T. Oates, then assemblyman from this county, who, being an operative miner, desired the honor and credit of the law. It was a hobby of his. John K. Sales engineered the thing in our county at home by getting up a numerous signed petition. The original idea had been previously advanced by myself, and the groundwork laid by talking about it among our people during years before.

Oates got our bill pushed through the Assembly by hard work, and because it was about the only bill he had introduced. I took charge of it in the Senate, procured a favorable report from the Committee on Mines, being on the committee, made a "big speech" in its favor, and had it killed by the lobby—the corporations and mine-owners—quicker than a wink. Sam Oates sat beside my chair while I spoke and while the vote was being taken, and was hugely disgraced, notwithstanding I had advised him beforehand that the opponents of the bill had slowed it to pass through the House only as "a tub to the whale," and that they had a dead thing all out and dried on heating it in the Senate—as they did, and I knew it—I had the list of yeas and nays made out lying on my desk, almost as the roll-call resulted.

At the next session, Hon. J. M. Days, now of San Francisco, being then assemblyman from Nevada county, introduced the present law, and as we had made it pretty hot for the opponents of the measure before the people in the election that year, we were able to carry it through. The law is good as far as it goes. It should read 200 feet and employing six men; perhaps that is the only improvement we could make. Suppose you publish the whole law. Very truly yours, E. W. ROBERTS.

Grass Valley, Nevada Co.

CANDLES.—An item of interest to the mining community is that a pool or trust has been formed East between the 16 or 18 candle factories, and for some time the trust has been trying to induce the three candle factories here to come into the ring. Two of the companies desire to go in, but are unwilling to do so without the third. Candles have advanced recently two cents per pound in the East, and this advance would be made here if the home manufacturers would come in.

The Northern coast coal mines are doing good work and are steadily increasing their shipments. So far they have found ready sale for their entire output without making concessions in price.

A New Mining Enterprise.

EDITORS PRESS:—Believing that most of your readers are more or less interested in whatever pertains to the welfare of the mining industry of our coast at large, I submit a few facts concerning a new incorporation denominated the Galena Consolidated Mining Co. The properties embraced in this consolidation are the well-known Shannon claims, situated in Washoe county, Nevada, about three miles by wagon-road west of Galena station on the V. & T. R. R.

In early mining days large quantities of ores were taken from these properties, then known as the Indian Boy mines. A large proportion of the ore was hauled by teams to California for reduction. The remainder was treated at a smelter located on Galena creek.

Owing to the fact that the treatment of lead ores then was a new industry in this part of Nevada and of course imperfectly understood, and furthermore the great expense of fuel and fluxes for proper smelting of the ores and high price of labor, the business of smelting was not a success and the mines were temporarily abandoned. Since then the only method of developing the claims has been performed principally by lease-holders, who instead of pursuing a systematic course have simply "surface robbed" the property. Under this system many carloads of good ore have been shipped to San Francisco, Salt Lake and Denver for reduction.

With reduced smelting charges, even with exorbitant freight rates, the leasees have all, with a single exception, met with gratifying success in their ventures. By reason of inadequate facilities the ores and waste were handled a half-dozen times, where, under systematic management, the needless expense of handling more than once might have been avoided.

The ores are chiefly a hard carboniste, although a large portion carry sufficient iron and lime to make them self fluxing ores, consequently may be reduced at a far less cost than where fluxes must be procured. One mine in this consolidation shows a ledge of hematite ore, and, although of a low grade as to gold and silver, is of great value to a smelting plant on account of its superior qualities as a flux. The value of the company's properties here may be best judged from the fact of their once having been worked at a profit when all mining expenses and shipping were much greater than at present.

The result from a millrun at the Melrose smelting works showed a total average value per ton of \$25.35, being silver \$19.35, gold \$6, and iron 85 per cent, with a small percentage of lead (less than 10). By adding a small quantity of lime in connection with the carbonate ores, it would enable a home smelter to handle any ores from this and adjoining properties. This will necessarily be accomplished in time. The returns from ores shipped to the various smelting works more recently averaged in silver 52½ ounces; gold, two-tenths ounce; lead, 32 per cent, making total value per ton over \$75.

By a cheap preparatory treatment of ore and by concentrating, as now proposed, before shipping, the bulk of ores will be greatly reduced and the value per ton shipped consequently increased. In view of the fact that smelting facilities are now within 16 miles of the mines, instead of hundreds as formerly, most of the ores heretofore considered valueless may now be shipped at a profit. This fact was demonstrated last April when a small lot of 4800 pounds was worked at the Reno reduction works, returning a total value of \$93.13, being silver \$35.95 and lead \$54.18—the proportion of lead being 38 per cent and all this taken for a trial wholly from the waste portions of the mine. Samples of ore from stopes, taken carefully for an average test by E. D. Boyle, Esq., assayed: Silver, \$138.91; gold, \$12.56; and lead, 68 per cent.

This is a fine carbonate ore and lies west of first workings, the ore now showing in upper stopes running lower in silver, no gold, but a little higher in lead, viz., silver, \$53.57; lead, 70 per cent. From present indications a large amount of these classes of ores may be taken out and shipped whenever thought advisable to do so. To be profitable, proper facilities both for mining and for hauling will of necessity have to be provided.

Several noted mining experts, having examined these properties, are unanimous in their opinions that the main ore body will be found westerly from old workings. This is determined by the main feeders pitching in that direction. In consequence, a shaft will be sunk at a point where, at a depth of 200 feet, it will intersect the vein. From this point the mine may then be properly and conveniently worked. At this stage great results are expected as the reward.

The company feels warranted in asking the public to take a hand with them in developing the property and thereby sharing the results. The capital stock is \$100,000, divided into 100,000 shares—\$1 each. It is proposed to sell one-half of the stock now at ten cents per share, the balance, if necessary, at whatever valuation future developments may seem to warrant. The board is composed of E. D. Boyle, Pres.; F. C. Lord, Sec.; E. G. Stevenson, F. E. Fielding and W. H. Armstrong, Trustees. Any further information will be cheerfully given by J. L. Stevenson, Supt., Reno, or by the secretary at Virginia City. Reno, July 16, 1888. F. B. L.

THE directors of the Mechanics' Institute are busy preparing for the coming fair.

TABLE OF CONTENTS.

EDITORIALS.—Cable Railroads; Cogswell Polytechnic College, 53. Passing Events; Timber Depredations; Aliens and Mineral Lands; To Investigate the Debris Problem; Lower California Mines, 58. Big Assays; The Late H. P. Gregory; The Launch of the Charleston; Condensing Chambers in Smelting Plants, 57.

ILLUSTRATIONS.—The Cogswell Polytechnic College, 53. Reveratory Furnace and Dust Chamber at Leadville, 57.

CORRESPONDENCE.—A Miner's View of Geology; Combs, Nevada; El Dorado County Mines; Two Shatts in Mines; A New Mining Enterprise, 54. The Castle Mountain Mines, 55.

MISCELLANEOUS.—The Russell Process, 55. **MECHANICAL PROGRESS.**—The Secret of Cast Steel; Rolling Out Chains of Wrought Iron; An Unsolved Mystery; Locomotive Building; Lead-Coated Sheet Metal Plates, 58.

SCIENTIFIC PROGRESS.—Face Reading is not a Science; The Direction of Sounds; The Phenomenon of Color; Drying Effect of Natural Oas; A Fragment of the Iliad; An Ancient Globe; The Horse; Virtue and Vice, 59.

GOOD HEALTH.—Emperor Frederick and General Grant; State Health Report; Fastings and Poisons, 59.

USEFUL INFORMATION.—Flowers in China; Artesian Wells in New York City; A Curious Instrument; Eagles Pursue and Destroy Deer; The Horses of Japan; How to Prepare and Color Calcimine; A New Fuel for the Prairies, 59.

ENGINEERING NOTES.—The Nova Scotia Ship Railway; De Lesseps and His Canal; The Eads Jetties; The Largest Drawbridge; Deterioration of Storage Batteries, 59.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 60-61.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 64.

Passing Events.

The closing down of the Germania smelter, Utah, is expected to be followed by the closing down of other establishments. This action is forced upon the smelting managements by the disastrous freight rates exacted by the railroads. The rats on bullion has been \$18 per ton, while the roads carry ore out for \$12 a ton. Ores that come from Nevada and Utah points going East have a certain rate to Salt Lake, which is much lower than on ores landed in Salt Lake for the home smelters. On the 23d inst., the rate on bullion from Salt Lake to the Missouri river was reduced from \$18 to \$15 per ton.

The failure of the new smelter at Colville, W. T., is bad for that region. Still it depended on the ores of one district, and there was insufficient capital to conduct the business.

Information printed in another column concerning the Lower California mines bears out the prediction made in the PRESS at the time the excitement began. That region has so little water available that it is hard to make any gold-mining operations successful.

The mines of this State generally were never in a more prosperous condition, and the quartz industry is making rapid progress.

The recommendation of the committee favorable to the Biggs bill, on the debris question, will please the mining community of California.

The water of the north fork of the Feather river, says the Biggs Argus, has been turned into the Big Bend tunnel, and very soon a large body of men will be working on the river bottom left dry by the tunnel.

Timber Depredations.

The Commissioner of the General Land Office has, it is said, received a telegram from the special timber agent on duty at Eureka, Nevada, to the effect that the depredations committed on the public lands by two corporations have amounted in that district to \$10,000,000; the two corporations alluded to being, presumably, mining companies.

How these two companies or any number of mining companies could have caused such extensive timber spoliation in that part of Nevada is matter for surprise, seeing there never was grown a single tree within 300 miles of the Eureka district available for making good lumber. The woodlands in that section, as well as throughout the entire State, save a narrow belt along the eastern slope of the Sierra, consist almost wholly of nut pine, mountain mahogany and juniper, all acrobby trees, and having a much scattered growth. There occur in a few places small patches of white pine, a somewhat larger tree, though it seldom reaches a height of more than 40 or 50 feet, and a diameter of two feet. The wood is soft, and when converted into lumber, warps badly. If two saw-logs are cut from this tree the upper one will be full of knots, rendering it almost worthless for lumber. As for the other trees mentioned, while they make good fuel, not even the most inferior kind of lumber can be manufactured from them. If they are sometimes employed for building cabins and corrals, palisade fashion, this is the only use ever made of them except for fuel.

The congressional law regulating timber-cutting on the public domain, enacted June 3, 1878, authorizes citizens of the United States to fell and remove for building, agricultural, mining or other domestic purpose any trees or timber growing on public mineral lands, under such rules and regulations as the Secretary of the Interior may prescribe. Any one guilty of violating the provisions of this Act or of the rules and regulations made in pursuance thereof, is liable to a fine of \$500 and to imprisonment for six months. Cutting timber on the mineral lands for sale or willfully destroying the same are also unlawful acts.

Although not so stated, the depredations complained of must, of course, have been committed in violation of some one or more of the above provisions; but, all the same, it puzzles us to see how any such amount of damage as is here alleged could have been done by these mining companies. Ten million dollars is a large sum, more, we opine, than all the trees ever grown in Central Nevada would sell for were they cut and corded up or converted into lumber.

A little figuring will disclose what an amount of improbability is involved in this statement. As above remarked, the tree growth throughout all that portion of Nevada is not only stunted but exceedingly sparse. Over large areas it will not yield more than two or three cords of wood to the acre, the average yield of the whole not exceeding five cords per acre. As this wood, before being cut, is worth not over \$1 per cord, the corporations complained of, to cause a damage of \$10,000,000, must have denuded 2,000,000 acres of their trees, an idea so preposterous that no one, except perhaps a timber agent, would entertain it for a moment. If a few thousand acres of these stunted and straggling forests have been so cleared off, this is probably about the extent of these alleged depredations. As the non-mineral public lands, valuable chiefly for their timber but unfit for cultivation, are sold at the rate of \$2.50 per acre, the injury done by stripping these sparsely timbered mountains of their trees could in no event be large.

It was evidently the intent of the Act first alluded to that the parties therein named should be permitted to use all the timber required for their several purposes.

It was evidently the intent of the Act regulating timber-cutting on the public mineral lands that the occupants of those lands should be permitted to cut and use all the timber required for their several purposes, yet the course pursued of late years by the Secretary of the Interior and the Commissioner of the General Land Office would seem to evince on their part a desire to frustrate such intent.

As evidence of this take the ruling of Commissioner Sparks, deciding that the charcoal-burners must not make use of dead and fallen trees, or pinon found on the public domain, and

this, even in the ore-smelting districts, where there may be little or no other use for this sort of wood, but where for the smelters charcoal is indispensable. The Commissioner holds the opinion that it would be better to let this timber remain where it is till it finally rots or burns up, greatly increasing meantime the danger of forest fires, than to have the carbon-aros convert it to such beneficial use. There may be law to warrant such decisions, but how about the practical sense of the thing? It must be inferred that the timber so taken was found on non-mineral lands, otherwise the use of it for the above purpose would be warranted by the law already quoted. But even then, as the removal of these dead trees could result in nothing but good all around, there was no need for the Commissioner interposing to prevent it. Every public officer, being empowered with a certain amount of discretion, is expected to exercise the same in the discharge of his official functions.

Aliens and Mineral Lands.

Representative Hermann of Oregon, from the Committee on Public Lands, reported favorably to the House on Tuesday the Senate bill providing that the Alien Land Act shall not affect the title to mineral or mining claims in the Territories, which may be acquired or held under the mineral laws of the United States, or any mills or other improvements thereon. The committee has added an amendment to the bill providing that the Act shall not be construed so as to authorize the acquisition or holding of any coal or iron lands in any of the Territories of the United States by any alien or foreigner.

The proposed amendment will have the effect of withdrawing some of the opposition to the bill, and will be rather a benefit than otherwise. It is the gold, silver, copper and lead mines in the Territories that the miners want to be able to sell where they can get the best price. The coal and iron interests of the Territories are less important, and it is well that no large tracts be sold to aliens. But the English companies that hny mines of gold, silver, copper or lead generally work them in a vigorous, systematic manner, put up big reduction works, employ many men and benefit the region where they operate in many ways. This has been the experience so far. They pay less attention to "stock" operations than our own people are accustomed to. It was a hardship to prospectors and miners in the Territories to pass a law which prevented their selling their mines to foreigners if they had the opportunity. We get big prices for our properties on the English market, and a great deal of harm was done to the mining industry when these sales were stopped. It is to be hoped that the proposed change in the law will be made at once.

To Investigate the Debris Problem.

A Washington dispatch states that Representative Biggs' bill, providing for an appropriation of \$100,000 for an examination and survey of the rivers and lands adjacent thereto in California, will be recommended for passage by the Senate Committee on Mining, in the hope that information looking to a settlement of the debris problem will be the outcome of the work, which will be prosecuted by Government officials.

It is well that this subject should be thoroughly examined by competent and disinterested engineers. It seems somewhat strange that there should be organized opposition to the measure on the part of certain Californians. If it is possible to permit the hydraulic mines to again be worked without injury or detriment to other interests, we ought to know it. If it is not possible, of course matters will remain as they are. There is no reason, however, why the subject should not be properly investigated. It costs the State nothing, the Government paying the bills. There is, moreover, no objection on the part of the Government to do this, since it sold the auriferous gravel land to the miners, who bought in good faith. Then the U. S. Courts enjoined them from working the ground. In fact this scientific examination of the problem should have been made long since. It will be a great benefit to the State to have the whole matter studied and then definitely settled one way or the other.

COPPER ore is being shipped from Pioche, Nev., to Salt Lake.

Lower California Gold Mines.

We had a conversation this week with Geo. E. Mills, who has just returned from the gold mines in Calmali district, Lower California. These mines are about 260 miles south of Esenada by land. From the seaport of San Domingo they are 50 miles inland, over a sandy road, with one large mountain to cross. Mr. Mills has a very poor opinion of the mines, which he says amounts to little, though many people have been going into the district, some of them even walking all the way from Esenada and San Diego, taking from 25 to 35 days for the trip. The placer mines are played out. The old Mexicans and others who have been working there have been using dry washers, but many have abandoned the ground and left their washers and implements behind. Shot gold is found, the fine gold of course being lost. Three men working a claim there said they were making from \$5 to \$7 a week.

The quartz mines are "pocket" claims, and from some of the pockets very rich ore indeed is found. The veins run from one to three feet in width. On some claims they have sunk 40 feet, but nothing rich has been found except at or near the surface. Some of the ore will soon arrive in this city and is not enough to attract attention, but there is very little of this sort of ore to be had. There is a five-stamp mill in the camp which has been at work some years.

A good many men have been disappointed by going to these mines. There are not more than 60 men in the permanent population. Mr. Mills saw some men come in nearly barefoot, having walked the whole 650 miles to get there. They get away as soon as they can. It is only occasionally that a steamer or vessel comes to San Domingo to bring freight. Mr. Mills himself waited from the 19th of April to the 1st of July before he got a chance to get back to Esenada by sea. The common experience is that the longer one stays the less money he has. Provisions and clothes are very high. Corn is 12 cents a pound; deer meat, 37 to 40 cents. A four bit pair of overalls costs \$4, and everything else in proportion. The gold is worth \$18 an ounce, but has to be sold for goods at the store, so it really brings about \$5 per ounce, considering the prices charged.

Some of the men who leave—for there is no work for them—go over to the copper mines above Muleje. The English company's mines on the gulf side, where the seaport is Los Angeles, have atopped work.

There are about 12 quartz mines opened at Calmali. An effort is to be made to sell the claims in this city, and the owners expect to get about \$300,000. If the mines showed any permanence, with ore half as rich as the pockets have yielded, they would be very valuable. As it is, however, no value can be placed on them, everything depending on the occasional pockets which are found.

THE FOREST HILL MINE FIRE.—The fire in the Forest Hill mine, in Placer county, which cost J. Bowring and Robert McKechnie their lives, was caused by the pipe from the blacksmith shop setting the timbers on fire. The shop is located 5800 feet from the mouth of the main tunnel. Over 70 men were inside the fire in the tunnel. They retreated to the side drifts, where the air remained pure, and when the fire subsided, and they started to rush outside, they were horrified to find the bodies of over 30 men who had rushed in in the hope of rescuing the inside miners, and had suffocated. All but the two named above were reanitated.

In making test of Occidental tin ore at the Dakota School of Mines one day recently, the fact was developed that it carried a considerable quantity of gold. This was a revelation even to the men who performed the work upon the mine.

THE Maxwell Creek mines, which were taken to London some time ago by Wm. Letts Oliver, have, it is said, been successfully placed in strong hands on that market. The Big Oak Flat ditch will be run in connection with the mines.

THE Frisbee wet mill, illustrated and described in the PRESS not long since, is in successful operation at the Copper Queen mine, Arizona, reducing ore for concentration. We shall shortly give a report of the results accomplished.

Big Assays.

We don't get so much excited in California over gold ore "assaying" \$60,000 to the ton as we do over that worth \$60; and, in fact, \$15 and \$20 rock is pretty good in these days, and pays well if there is enough of it. Whenever we hear of people finding \$50,000 or \$60,000 ore we think some fellow has found a "specimen" or a little pocket. It is pocket mines generally that show huaches of ore of great value, but pocket mines and specimen mines do not bring high prices as mines. In such claims it is well to count on what is in actual sight and nothing more. The old-fashioned \$1000 a ton rock we used to hear about is seldom mentioned in these days for fear those who know anything of the subject will "copper" the statement and have nothing to do with the man who speaks of it.

These remarks are called out by the dispatches from Michigan, where we are told men this week brought in gold rock from the Lake Superior Iron Co.'s mines. They have 300 pounds of the rich rock. It is estimated as worth way into the thousands, and some say the assays will show \$60,000. We don't often assay that kind of stuff in this country, but take a mortar to find out the value. "The quartz vein on which the shaft was sunk was discovered three years ago by Ishpeming men, but, with the exception of exploding one charge of dynamite, which exposed a rich pocket of gold-bearing quartz, nothing was done, because the property was owned by the Lake Superior Iron Company, which would not lease nor sell it. Last summer the company put a few miners at work on the property, and a test shaft was sunk about 18 feet, at the bottom of which a small pocket was struck which produced gold-carrying rock which assayed \$40,000 to the ton. All work was suspended then and nothing done until two months ago. Rich rock has been encountered all along, and the wonderful find has thus set the people wild. The shaft is now down 22 feet, and is about 18 feet wide at the bottom."

This is rather a curious shaped "shaft," 22 feet deep and 18 feet wide. They must be going to have a triple compartment outfit on that. But it is easy to get up an excitement over gold in the East. Out here when a fellow strikes a pocket like that he is congratulated and people hope he will get another, but they are by no means sure of it. Some pocket mines in this State have paid handsomely, but there are so many chances to be taken that it is seldom any big price is paid for a mine of that character.

The Prescott Journal-Miner declares that what Arizona needs in the way of the development of her mines is men of means who are willing to invest their capital in legitimate mining enterprise, and not kid-gloved mining men, who take hold of such a proposition to float the stock among their friends, regardless of the merit of the property.

CHARLES REED was killed last week by a rock falling upon him in the upraise from No. 9 tunnel, Sierra Buttes mine, Sierra City.

The Late H. P. Gregory.

Henry P. Gregory, who died at his home in Oakland on Tuesday night, occupied a position of prominence among the dealers in machinery on this coast. In his death, the community loses a valuable member and an honorable and upright gentleman. Among his associates he was well liked for his genial and pleasant manners, and he had acquired an enviable reputation in business circles.

After having been employed with Treedwell & Co. for some years, he went into business for himself in 1874, under the firm name of H. P. Gregory & Co., and afterward established branch houses in Portland, Oregon, and Sydney, N. S. W. His brother, Siles P. Gregory, was

fine ranch near the shores of Monterey bay, between Aptos and Soquel, where he had a comfortable country residence with pleasant surroundings.

Mr. Gregory entered as a volunteer in the U. S. Navy at the beginning of the war, and served as an engineer. He was in active service and in many of the great naval battles. At the close of the war he came to this city. He was a member of the Bohemian Club and the Pacific Club. He was also a member of the Loyal Legion, the Ancient Order of United Workmen, the Knights of Honor, and a Knight Templar. His cheerful disposition, natural politeness and pleasant manners endeared Mr. Gregory to a wide circle of friends. His business associates will join with his personal friends in

REVERBERATORY FURNACE AND DUST CHAMBER AT LEADVILLE.

associated with him in business until about a year since, when he died.

The firm started in a small way on First street between Market and Stevenson, but soon enlarged their business and moved to the foot of Market street. Soon after the completion of Union block, they took the corner store on Fremont and Mission streets. The premises are the finest in the city for the class of business conducted, and a very large and varied stock is carried. Mr. Gregory made frequent visits East and abroad, and secured many valuable agencies, which he conducted with marked ability. Being an enterprising man, he has built up a fine business from very small beginnings. Ever since he was established for himself he has been a constant advertiser in the PRESS, and was well known, personally, to many of our readers.

Mr. Gregory was a man in the prime of life and with everything to make life attractive. Successful in business, he had made for himself one of the pleasantest homes in Oakland. He was peculiarly a domestic man and enjoyed his home life. He leaves a widow and three children, two boys and one girl. Mr. Gregory has of late years greatly interested himself in his

paying the last tribute of respect to his memory.

A BALCONY will soon be built around the museum-room of the State Mining Bureau. The balcony will be placed about ten feet from the floor, and will be nine feet broad. The want of the additional room thus obtained has long been felt, as all the available space had already been crowded with specimens.

THE mining machinery is being removed from the Noonday and Red Cloud mines, Bodie, and taken to Anaconda, Montana, but Capt. John Kelly says there will be more machinery arriving in Bodie within a short time than has ever been hauled out of the camp.

A CALIFORNIA company with \$15,000,000 nominal capital is about to expend \$1,000,000 in a plant for developing iron, coal and limestone deposits at Iron City, Utah Territory.

THERE is a quartz vein in Marin county which has ore assaying $1\frac{1}{2}$ ounces gold and 14 ounces silver to the ton, but the mine is not developed to any extent.

The Launch of the Charleston.

The launch of the steel cruiser from the shipyard of the Union Iron Works, on Thursday evening of last week, was an occasion which will long be remembered in this city. No such immense crowd ever before gathered in this State at anything connected with our industrial interests. All the roadway leading to the works were crowded with people; the steamers, tugs, yachts, and all sorts of craft were loaded with passengers; the shipyard was filled with an expectant multitude, and from every point of vantage were masses, crowds and groups of people to watch the launch.

We have before described the vessel, which is still incomplete, the hull having been launched to make room in the yard for the other cruiser which is to be built. The arrangements for the launch were perfect, and there was no delay or hitch of any kind. At the appointed hour the huge mass of steel slid majestically and smoothly down the ways into the bay, amid the howling of whistles, firing of guns, and shouts and cheers from thousands of people.

It must have been a proud moment for Irving M. Scott, the man to whose energy the whole thing was due. He and his associates were busy with the preparations until shortly before the appointed hour. On a platform near the bow were the Governor of the State, the Mayor, Supervisors and Federal and State officials, the officers of the army and navy and the Government band. Miss Alice Scott christened the vessel. As the great hull moved slowly down the ways, the band played "The Star Spangled Banner," and the music inspired the vast crowd of people in the yard to join their voices in the national song. As soon as the launch was over, cheers were given for all who had been prominently identified with the event.

No more successful launch ever made. There was no delay, and no accident of any kind, and the whole affair reflects credit on those who had it in charge. The people were proud to know that we had in our midst an industrial establishment that was enabled to accomplish so great a work so successfully.

Condensing Chambers in Smelting Plants.

In recent numbers of the PRESS we have given descriptions of the Leadville smelting furnaces from the U. S. Geological Survey monograph No. XII, by Emmons, on the "Mining Industry of Leadville." In the PRESS of May 12, 1888, was given the elevations and sections of Smelter A. On this page we give engravings showing the reverberatory furnace and dust chambers of the same smelter. In Fig. 3 the chamber is seen in horizontal sections, divided into three parts by means of partition walls W, the arrows indicating the circulation of the fumes. Fig. 2 is a vertical section of the same chamber, and the construction and working are shown by the drawings. About 150 tons of dust were collected in this chamber in six months.

The roasting furnace is shown in elevation in Fig. 1, chiefly with a view of giving the dimensions, for it presents no peculiarity in construction. Its width (not indicated in sketch) is 12 feet. The sketch shows the system of bracing by rails; the hinged cast-iron doors d and the dotted lines indicate the internal disposition of the furnace.

The roasting furnace is used at Smelter A for roasting the chamber dust previous to remelting. In the study of metallurgical products, it will be seen that it is an expensive and useless operation, and that it were better, on the contrary, to use it for the roasting of matte and speiss. The former being roasted in heaps, loses a great deal of the silver, and the latter is not treated in Leadville. The main point of interest in this roasting furnace is the flue C, in which a good deal of the product utilized during the roasting is condensed; so that this furnace is admirably adapted for the treatment of matte, accretions and speiss—all products containing a great deal of silver. S represents the stack of the furnace; G the damper of the stack. The ashpot of the furnace is not visible, but is placed at h.

SONOMA QUICKSILVER.—The Great Eastern quicksilver mine, Sonoma county, is shipping upward of 100 flasks of quicksilver monthly. The Mount Jackson mine, adjoining the Great Eastern, has been bonded for \$111,000.

MECHANICAL PROGRESS.

The Secret of Cast Steel.

The history of cast steel, remarks a contemporary, presents a curious instance of a manufacturing secret stealthily obtained under the cloak of an appeal to philanthropy. The main distinction between iron and steel, as most people know, is that the latter contains carbon. The one is converted into the other by being heated for a considerable time in contact with powdered charcoal in an iron box. Now, steel thus made is unequal. The middle of a bar is more carbonized than the ends, and the surface more than the center. It is, therefore, unreliable. Nevertheless, before the invention of cast steel, there was nothing better. In 1760 there lived at Attercliffe, near Sheffield, a watchmaker named Huntsman. He became dissatisfied with the watchspring in use, and set himself to the task of making them homogeneous. "If," thought he, "I can melt a piece of steel and cast it into an ingot, its composition should be the same throughout." He succeeded. His steel soon became famous. Huntsman's ingots for fine work were in universal demand. He did not call them cast steel. That was his secret. About 1780 a large manufactory of this peculiar steel was established at Attercliffe. The process was wrapped in secrecy by every means within reach. One midwinter night, as the tall chimneys of the Attercliffe steel works belched forth their smoke, a traveler knocked at the gate. It was bitterly cold, the snow fell fast, and the wind howled across the moat. The stranger, apparently a plowman or agricultural laborer seeking shelter from the storm, awakened no suspicion. Scanning the wayfarer closely and moved by motives of humanity, the foreman granted his request and let him in. Feigning to be worn out with cold and fatigue, the old fellow sank upon the floor and soon appeared to sleep. That, however, was far from his intention. He closed his eyes apparently only. He saw workmen cut bars of steel into bits, place them in crucibles and thrust the crucibles into a furnace. The fire was urged to its extreme power until the steel was melted. Clothed in wet rags to protect themselves from the heat, the workmen drew out the glowing crucibles and poured their contents into a mold. Mr. Huntsman's factory had nothing more to disclose. The secret of making cast steel had been discovered.

ROLLING OUT CHAINS OF WROUGHT-IRON.—The process, some time since announced, of rolling out chains of wrought iron from the solid bar, has, with certain improvements, been successfully resorted to—the principle of forming the rollers and the process of rolling out a chain being, in this case, similar in some respects to the method employed for coating the links and having them come out together in a chain from a mold. In the latter operation, the flask is made to part equally in four ways, and the chain molded while the links are separated so as to divide the spaces equally between them, giving as little clearance as possible, which will not change their appearance perceptibly—the flask is divided, the chain is moved, and one is cast in the mold. Similarly, a piece of chain is edged out of a bar of iron in an analogous manner, by means of four converging dies. These, in producing a continuous chain in this way, the dies are made continuous by having them formed on the circumference of four rollers, arranged with dies distributed in equal divisions, and the rollers driven by gear wheels, so that the four parts of a link will meet accurately in place; proper clearance is given to the dies, so as to allow the material to leave the matrix freely as the roller revolves. As the blank is carried forward between the rollers, the dies partially press or edge out the links at right angles to each other, breaking the fin or feather edge that is left on the inside of the link.

AN UNSOLVED MYSTERY.—Iron, of all others, is the metal in most general use, and unlike wood and other materials, which "perish in the using," iron when it has served its purpose in one position goes to the foundry or forge, as scrap iron, and returns for some other use as good as new, with very little loss. Old castings are recast in some new form and are no way inferior to castings made of new pig iron. Old rails are re-rolled and come out new. It is only in the form of nails and some other small matters that iron is lost. Now when we observe the millions of tons of pig iron, fresh from the ore, that is added to the stock on hand every year, the mystery is that the demand still remains unsupplied. The constantly increasing use of iron, in all of its forms, would account for the increased output from the furnaces every year, if, like other materials, it perished with the first use; but as it returns to the common stock as new material, why is the demand still maintained?—*Boston Journal of Commerce.*

LOCOMOTIVE BUILDING.—There are 15 private locomotive-building establishments in the United States, which built 1912 engines last year, while the railroad-shops turned out 318. It was the largest production on record, the cost of the locomotives being near \$20,000 each.

MUCILAGE OF ACACIA. made with acetic acid in place of water, makes a good liquid cement. It cannot be used for marble.

Lead-Coated Sheet-Metal Plates.

A Cheap and Valuable Substitute for Galvanizing Iron.

In view of the interest attached to protective coating for sheet metal, it is appropriate to direct attention to a process which has recently been adopted by the Ajax Metal Company of Philadelphia, the coating used by them being lead. The process is worked under patents granted to Mr. Francis J. Clamer of the company, and embraces a special treatment for cleaning and preparing the sheet metal and a separate method of treating the lead-coating bath. It has been found that where acids alone were relied upon to clean the plates—this being the method in current use—the surface of the plate is not entirely freed from impurities; in other words, not chemically cleaned, and the coating subsequently applied will therefore not adhere perfectly. The Ajax Company, therefore, use the acid bath, when it is employed at all, only as a preliminary step in the cleaning process for removing quickly the greater portion of the impurities before thorough cleaning is effected by other means. These form the essential features of their process, and, in cases where time is no great object, the acid bath is entirely dispensed with. The plate to be cleaned, whether having been first treated in an acid bath or not, is placed in a bath of cyanide of potassium and water in about the proportion of six ounces of the former to one gallon of the latter. The plate is then subjected to the action of a galvanic current, being placed in the position occupied by the anode in an ordinary electro-plating bath. The result is a perfectly clean surface on the plate under treatment.

After being thus chemically cleaned, the plate is immersed in a bath of chloride of zinc, made by dissolving metallic zinc in hydrochloric acid until the latter is thoroughly saturated and will take up no more of the metal. This bath prepares the plate for a more ready adhesion of the coating to be applied and constitutes an important step in the process.

The method of treating the final bath of molten lead which is to be used as the desired coating is the subject of a separate patent. We will explain here that lead, while in a molten state, absorbs various gases from its surroundings and from the atmosphere. These absorbed gases prevent the lead from adhering closely to the surfaces of different metals which are dipped into it, and cause the small holes and blisters which are frequently found in ordinary lead-coated sheet metal. Molten lead, furthermore, as many of our readers may know by experience, is somewhat thick and sluggish, and a coating formed in the ordinary way is therefore very apt to be full of ridges, the result of uneven distribution. To overcome all this the Ajax Company treat the lead in a molten state with sal ammoniac, arsenic and phosphate of lead. The sal ammoniac has great cleaning power and drives out from the lead all the gases and impurities which it has absorbed from its surroundings.

The arsenic, by its hardening and solidifying qualities, renders the lead incapable of taking up any further impurities. It has been found, in fact, that it permanently protects the lead against these influences, and the metal may be melted over and over again without losing the effect. The phosphate of lead finally renders the mass more fluid. The combined effects of the three materials on the molten lead have been found to be such as to make it an excellent coating.

In preparing the lead bath, ordinary pig lead is melted in a suitable vessel and covered with powdered charcoal to prevent oxidation. This having been done, there are added for every 100 pounds of lead, first three ounces of sal ammoniac, then one-half ounce of arsenic, and after this three ounces of the phosphate of lead, and finally one-half ounce of borax or similar flux. The substances, it should be noted, are introduced separately and immediately, one after the other, the molten lead being gently agitated in the meantime so as to produce a homogeneous mixture. The plate to be coated with the lead, after having been prepared by the various processes above described, is then dipped into this bath in the same manner as when coating with zinc. If the bath is not needed for immediate use, the lead may be run into bars or ingots and used at any future time. We understand that the proportions of sal ammoniac, arsenic, phosphate of lead and borax may be varied, and the use of the borax or flux omitted entirely. The best results, however, are apparently obtained when the above proportions are retained. We may remark here, incidentally, that the claim of the Ajax Company is that their coating consists of pure lead, and not of any combination, such as tin, lead, zinc and others. Mr. J. G. Hendrickson of the company informs us that a separate company is being organized to develop the process, and will probably be ready for business in a short time. As we understand it, it is proposed to start sub-companies and lease plant rights throughout the United States. A small plant showing the working of the process is in use at their Philadelphia works in a practical way. Mr. Hendrickson further writes that they have advanced far enough to prove that leaded iron or steel can be put on the market at a price fully 50 per cent lower than galvanizing can be done for, with a good profit. The electric cleaning process is said to have a good deal of the labor which is ordinarily required in cleaning sheet-metal surfaces.—*Iron Age.*

SCIENTIFIC PROGRESS.

Face-Reading is not a Science.

The Countenance is not a Reflex of the Soul, but Often Only a Mask.

"Physiognomy is rather a vagary of the imagination than a science," said a prominent student of human nature the other day, "and, therefore," he continued, "I deny that the expression of a man's face is really an index of the person's soul, as it is generally conceded to be, and as the object of language is said to be the concealment of thought, so the expression of one's countenance is but the mask to conceal one's inner self."

"There is a tradition that far back in the days of which history tells us nothing, there was no speech or language among men, but that men read each other's wants and wishes in their faces, and as the world was pure nothing but purity appeared in the expression of the human face. But wickedness crept in and man sought to keep from their faces the evil that was in their hearts, thus preventing the countenance from becoming the index of the soul."

"No," the speaker went on, "I have no faith whatever in physiognomy as a science, for as a science it is fanciful and wild. Take, for instance, the portraits of men who have become famous in the world of statesmanship, philosophy, science, art and letters, and search and scan their faces for traces to mark their fame, and how often you will be disappointed. The same is the case with men adepts in vice, cunning and crime. Little can be told from the external appearance of individuals as to their peculiar traits and characteristics by which they are known to their fellow-men."

"That certain habits of life affix their stamp to face or form is, no doubt, true, but the solution of that condition is not in the reflex action of the mind and soul, but for the reason that a certain set of muscles are brought habitually into play and cause a special development. Is the man necessarily all smiles and laughter who has wrinkles at the outer corners of the eyes and upward-curving lines around his mouth? Yet those are the mechanical lines, which would indicate a merry-hearted man, if the science of physiognomy is true. Those lines are only muscular, simply the result of habit, and may be dictated by the rankest hypocrisy."

"Naturally the brutal and ignorant classes will have coarser features, and will possess brutal and animal faces, generally resulting from inherited qualities, and, therefore, they will do coarse and brutal things. It would be an easy matter to trace a resemblance between the face and the crimes of such people, in whom brutality and coarseness predominate; but where will you find the lines and earmarks of brutality in the faces of the handsome Wilkes Booth or the cultured and elegant Eugene Aram? Look upon the canvases bearing the portraits of the beautiful and angelic fiends that ruled the Emperors of Rome, and you will see only patrician faces, but they brought the empire to destruction."

"Instances of this character might be given indefinitely, but every one who has made a careful study of the subject will agree that the connection between the facial expression and the inner spiritual nature is a very difficult one to trace."—*N. Y. Mail and Express.*

The Direction of Sounds.

The difficulty in determining the true and exact direction of the sounds we hear meets us in various ways. The hunter hears the note of a bird, the hiss or whistle of a deer, and the sound indicate identity and proximity, but not direction. The hunter waits for repeated renewal of the sound to ascertain its exact position, and even then verifies his audition by his vision. The hunter by his campfire may aim between the luminous dots of reflected light, which he knows to be the eyes of a wolf; but he would scarcely be able to aim at or even near that spot on simply hearing the howl from the wolf that owns the eyes. The plainman hears a shout in the distance. He may recognize it as the voice of a comrade, and fix the general direction, as north, south, east or west, but hardly more. He may shout back, and the two may come together; but if it be dark, and there is no fire or other signal, the shouting back and forth must be frequently repeated and varied from a simple to a complex sound, that each may correct the error of his own and, finally, eliminate his personal equation, and the sound will appear to swing, pendulum-like, right and left, with short and shorter strokes, till the comrades come together. How many of us going to the next street, running at right angles to the car tracks, can tell from hearing the bell of the approaching street-car before the car comes in sight whether that car is going north or south? It does not seem that animals can determine the direction of sound much better than man. The sleeping dog, roused by his master's call, is all abroad as to his master's location, and determines it by sight or scent, or both, frequently running in several different directions before hitting the right one. The deer, on being startled by the unseen hunter's tread, is not always right in his selection of the route to get out of harm's way. A flock of geese, ducks or other birds, on hearing a gun, is as likely to fly toward as from the sportsman, if he has kept entirely out of sight, and the flash of his piece has not been seen.

It is a question whether the blind are better able to determine the direction of sound by ear than are seeing people. It is possible that their senses of touch and smell are so highly developed that their instantaneous action with that of the ear give them a decided advantage over seeing people in this matter. I have known a blind man to be so sensible of the current of air put in motion by the speaking of a single word in a room that he could select the speaker by his location, though others were present. So, too, I have known a blind man to locate and identify the various people in the room, he saying he did it by the different scent evolved from each, the seeing people there not being sensible of any scent from any one. And yet he, when standing in the middle of the room with his nose stopped, could not give the direction of one single speaking person.

Professor Alexander Graham Bell reports at Saratoga in 1879 a series of experiments in binaural audition, showing, among other things, that direction cannot be appreciated by monaural observation; that when the source of sound is at the nadir of the observer the perception of its direction is absolutely unreliable, and that not one of the many on whom he tried the experiment had the slightest idea of the true direction of a sound produced beneath him. We are so much accustomed to the aid of our other senses, especially that of sight, that we incline to give more value to audition in determining direction than it deserves. That is one reason why we err so largely when so placed that the eye cannot correct the error of the ear—in fact, many people seem to be unaware that they have any inability to locate sound by the ear until they have learned the fact by experience, and even then they appear to consider marked instances as abnormal.—*Popular Science Monthly.*

THE PHENOMENON OF COLOR.—A writer on the nature and phenomena of color now asserts that, contrary to what has been the general opinion, its causes and effects are determinable solely by the wave theory of light; that color depends, in fact, upon the number of light waves reflected from any object infringing upon the retina of the eye. According to this theory there are in red about 40,000 waves to the inch, and these will strike the eye at the rate of four hundred and forty-seven millions of millions of pulsations per second; in violet there are 57,000 waves to the inch and six hundred and ninety millions of millions of pulsations per second, and the other colors have wave lights intermediate between these two. From all this the conclusion is arrived at that color does not exist either in the object or in the mind or the brain of the observer—it is an effect. This is illustrated by the fact that there can be no appearance of a fire on a desert island where there is no eye within seeing distance; the chemical process known by the term combustion goes on, but there is no appearance of the flame save when its light waves strike upon the retina of an eye.

DRYING EFFECT OF NATURAL GAS.—It has been remarked that the heat of natural gas is drying to a marked degree above the heat from burning coal or wood. The knowledge of this fact enables builders in the cities where gas is to be had to virtually dispense with winter. Inclosed buildings are easily and cheaply heated for the painters and the plasterers, and even exterior consumption of gas is resorted to successfully in some instances to aid the masons. The time is coming when such conveniences will not be confined to the favored regions where the Trenton rock comes up near enough to the surface to be tapped.—*Light, Heat and Power.*

A FRAGMENT OF THE ILIAD.—The explorer of the Fayum, Mr. Petrie, has discovered "a splendid fragment of the Second Book of the Iliad, written on papyrus in the finest Greek hand, before the rounded uncial or cursive scripts came into use. This precious document was found rolled up under the head of a mummy which was buried simply in the sand without the protection of a tomb. It measures apparently from three and a half to four feet in length. The date of the manuscript is about the second or third century. It will be edited by Prof. Sayce."

AN ANCIENT GLOBE.—In the National Library at Paris there is a Spanish globe 350 years old, on which the Congo follows in a remarkable manner the course now given to that river on the maps. All the best maps in the sixteenth century showed the Congo as rising in a lake far inland, while in this century we first tried to identify the Congo with the Niger, and then for many years made it flow north.

THE HORSE.—The origin of the wild horse is traced through tradition to Central Asia as the aboriginal abode of the horse, says Mr. Steele in his paper on "Wild Horses," while our Mexican mustang and bucking broncho are descendants of domesticated animals introduced from Europe. He gives us the date of 1537 as the landing of the first horse in America at Buenos Ayres.

VIRTUE AND VICE.—A scientist has discovered a curious regularity in the geographical distribution of certain virtues and vices. Intemperance is found north of the forty-eighth parallel; amatory aberrations south of the forty-fifth; financial extravagance in large seaports; thrift in pastoral highland regions.

GOOD HEALTH.

Emperor Frederick and Gen. Grant.

The scandalous discussion in regard to the disease, treatment and death of the late Emperor Frederick of Germany, does not indicate a very creditable condition of affairs between the physicians involved in the controversy. In many respects there is a striking parallel between the cases of our own lamented ex-President Grant and that of the Emperor. In both cases the heroism manifested in connection with their terrible suffering and doom was far superior to the valor which each had shown upon the battle-field, greater than that was. With the exception of the case of Gen. Garfield, the history of the world does not afford a parallelism to the profound and world-wide sympathy which was manifested in behalf of these distinguished sufferers. The medical bulletins in each case became for many weeks the one engrossing subject of interest to an anxious world. In both cases the malady was probably known from the first to be cancer and was considered incurable by the physicians in attendance. Some political significance undoubtedly had to do with the decision of the faculty in the case of Frederick. Sympathy and hope against hope kept the real character of Grant's disease in the dark as long as possible. In view of these two notable recoverments, and of the rapidly increasing spread of this terrible disease all over the world, the question naturally comes up, as it has many times before under similar aggravating circumstances,

Can Cancer be Cured?

Hall's *Journal of Health*, one of the ablest and most reliable journals devoted largely to the popularization of matter pertaining to diseases and their prevention and cures, in alluding to this question, says:

Nor is it quite established that cancer is an incurable disease. That there have been cases of cure by methods unrecognized by practitioners of the older schools of medicine is quite well established, and the belief is gaining ground that there is something outside of them yet to be learned in the healing art. But whenever a cure is effected by a specialist it is usual for opposing schools to dispute that the patient was really a cancer subject.

We would call especial attention to the above paragraph from so distinguished a source. It is but reiterating what we have often said in these columns. Further, in the same direction, we quote from one of the most reliable medical works extant—a standard English book entitled "Cancer, its Varieties, their Histology and Diagnosis," by Henry Arnott, F. R. C. S. On page 77 that author, in speaking of the various forms of growths commonly called cancers, says:

For it is extremely unlikely that all these tumors are to be met with the same remedy. Granted that so-called "constitutional remedies" have always failed to cure new growths, it is yet a matter of history that hosts of tumors have been permanently arrested in their progress, and it is also a matter of history that among these have been included not a few instances of genuine cancer.

The same author, on the second page of his preface, says:

Hitherto our modes of treatment of cancer have been, confessedly, unsatisfactory; and so long as our ignorance of the pathology of the disease prevented us from being able to suggest a reliable prognosis in most cases, the result of the various remedies from time to time proposed could not possibly be weighed, for, when a remedy appeared to be successful, there always remained a doubt as to the nature of the tumor treated, and, consequently, of the share of the remedy in its removal.

In regard to the latter portion of the above paragraph, we would remark that the evidence which has been heretofore given in these columns would seem to set at rest all doubts as to the possibility that any mistake could be made in regard to the character of many of the "tumors" which have been cured in this city. We have given the names of patients and the attending and operating physicians in quite a number of cases where "tumors" have been removed once, and sometimes twice, by our most distinguished surgeons, whose reputations will not admit of a doubt as to their knowledge of the character of the tumors after they have removed them. In the cases referred to, the "tumors" have come again, presenting precisely the same characteristics, have been pronounced most unmistakably cancerous, and have been cured by constitutional treatment, aided to some extent by simple, painless, outward ap-

plications. The character of the physicians referred to, we repeat, will not admit that they could have made a "mistake" in their diagnosis.

We hold that it is due to science and humanity that such cases or similar new ones, which may be prevented, should be subjected to a careful consideration by a competent medical commission. If the faculty continues to refuse to take such a step, the State authorities will soon be called upon to act in the matter. Money from the State Treasury is being applied by the State Board of Health in many ways of infinitely less importance than that which is proposed.

State Health Report.

The report of the State Board of Health for June shows a very satisfactory condition for the month. Reports were received from 87 cities and towns, aggregating estimated population of 702,050. The total number of deaths was 964, a percentage of 1.3 per thousand for the month, or an annual death rate of 16.3—the lowest death rate reported for the year.

Among the diseases enumerated, consumption as usual leads with 156 fatalities; heart disease follows next with 67; pneumonia counts 66; diseases of the stomach and bowels count 117. These latter are more or less preventable and are almost always brought on by excess in diet or bad hygienic surroundings, such as high temperature, etc. It is hoped that in the near future the time will come, as it surely should, when our young people will be more thoroughly educated in matters pertaining to health—when such matters will be considered quite as essential in education as reading, writing and arithmetic. Under such circumstances the application of such knowledge will so control the appetites, habits and habitations of our people as to reduce all preventable diseases to their minimum.

It is a matter of regret that the program of discussions at the last week's session of our National Educational Association did not include the subject of hygiene in our common schools among the numerous educational problems to be considered by that body.

The other diseases not enumerated above were as follows: Alcoholism, 9; erysipelas, 1; cerebro-spinal fever, 6; remittent and intermittent fevers, 7; typhoid fever, 35; whooping cough, 5; measles, 2; scarlet fever 9; croup, 8; diphtheria, 20; congestion of lungs, 10; acute bronchitis, 16; other causes, 417. Among the latter, 12 are set down for cancer, which is an unusually small mortality from this cause.

FASTING AND POISONS.—It has been ascertained by careful experiments conducted by M. Roger that poisons lose one fifth of their toxic power when taken into the system by fasting.

USEFUL INFORMATION.

FLOWERS IN CHINA.—The Chinese have a passion for flowers. You may see on the hundreds of canals that cut up the country around Shanghai, boats whose dingy and miserable appearance betokens the poverty, even the beggary, of their occupants; and yet near the stern, on top of the sawhang or cooking canopy—the "galley"—you will see from two to a dozen pots of flowers. Little Chinese girls nearly always place a sprig of some bright flower in their glossy tresses of raven black, and they sometimes show a good deal of taste in the arrangement of their nosegays. Just about the first of February, or near the Chinese New Year, one may see men and boys selling branches of a small bush that bears a yellow flower, somewhat resembling the spice hush flowers of Virginia. This flower has, to a Chinese, associations bright and pleasant as those that clung around the far-famed Hawthorn that bloomed in old England on "Old Christmas Day." You can buy in the market for a few cents, or cash, a little flower pot with a few bulbs of daffodil in it, and by keeping it in the window of your room, soon have a few bright-looking flowers. The Chinese do not plant in their parks such elaborate flower-hats as the Americans and Europeans, but they are very fond of pot flowers.—*Vick's Magazine.*

ARTESIAN WELLS IN NEW YORK CITY.—It is said that there are over 1000 artesian wells in the city of New York. Many establishments, such as breweries, malthouses and manufactories, which require a large supply of water, have found it to their advantage to sink wells so as to save paying the city water rate. The wells are not always successful, for the projectors cannot always tell the nature of the formation they are going to bore through until they get there. A contractor agrees to sink a well at from \$6 to \$12 per foot, according to the hardness of the strata he has to go through; then he goes to work with the same methods perfected in the oil regions, and bores at the rate of about 20 feet a day, and after going down about 400 feet he probably strikes water, though sometimes not until much deeper, and sometimes not at all. The one which discharges the largest amount of water is located at the foot of West Thirty-ninth street, which,

while it is only 550 feet deep, discharges 90,000 gallons daily. The deepest well is at Third avenue and Sixty-seventh street, it being 1250 feet, and it only makes a daily average of 10,000 gallons. These wells vary very much in depth, and the depth of the well is no indication of its capacity.

A CURIOUS INSTRUMENT.—A writer in the *Chicago News* says: It is a curious thing that the Italian ocarina, or earth-flute, has not received more attention from music-lovers in this country. Of course it is sold in the stores here, and you occasionally hear it in a minstrel show, but not one man in a hundred knows anything about it. I have heard it played in Italy, and the music from a quartet of the instrument is exquisite. Its range is limited, but the quality of its tone when skillfully played is pure and queer. It has a pastoral flavor, reminding one of piping shepherds, and a classical environment. The ocarina is very simple. In shape it is something like a pear or a small gourd. It is made of baked clay. Its range is about 12 notes. No instrument can be more easily learned, for it almost plays itself when one has mastered the scale, and there are no keys nor any elaborate fingering to embarrass one. The North Italian peasants use it constantly in the fields, and when you hear one of their peculiar melodies from a practiced quartet you wonder such simple means can produce so beautiful a result.

EAGLES PURSUE AND DESTROY DEER.—Capt. Thomas Frazer of the Argyll and Sutherland Highlanders writes to the *London Field*: On March 22d, as my father's Stroneldrigg keeper, John Rose, was walking over his ground accompanied by Lord Govat's keeper, they saw five red deer leave a small piece of birch wood and stand looking about them for a little. Three golden eagles appeared and immediately attacked one of them—a hind. She immediately bolted at full speed, followed by the eagles, and after going about 300 yards, one of the eagles drew himself together, hovered, pounced and fixed on her head, holding on for about five or six strides, when she fell head over heels, and thus ridded herself of the first eagle for the time. This occurred about a dozen times, the eagles coming to the attack in turns. In about ten minutes the hind seemed exhausted, and then the keepers were able to get up to her, finding that the poor beast was quite stupefied, her left hind leg broken, her tongue hanging six inches out and her mouth open.

THE HORSES OF JAPAN are not numerous and are used for saddle purposes and for the army. They are mostly of the pony build. They are the most gallant brutes on earth, as every lady horse they meet on the thoroughfares calls forth all their chivalry. The saddle horses go when they please and stop when they will, and are all shod with iron; all others, as well as the park cows and bulls, have their feet protected by a shoe of straw, and very excellent shoes they are. The straw sandals for a man cost about 1½ cents of our money, and a full set of shoes do not cost but a trifle more. In some parts of the roads they are literally padded with worn-out shoes and men's sandals. Whenever a wearer finds his foot protection too much worn he discards it and dons another, of which he usually has an extra pair, and the animals of burden are served the same way. The mares are employed in raising colts and carrying packs.

HOW TO PREPARE AND COLOR CALCIMINE.—Soak one pound of white glue over night; then dissolve it in boiling water and add 20 pounds of Paris white, diluting with water until the mixture is of the consistency of rich milk. To this any tint can be given that is desired. Lilac—Add to the calcimine two parts of Prussian blue and one of vermilion, stirring thoroughly and taking care to avoid too high a color. Gray—Raw umber, with a trifling amount of lampblack. Rose—Three parts of vermilion and one of red lead, added in very small quantities, until a delicate shade is produced. Lavender—Make a light blue and tint it slightly with vermilion. Straw—Chrome yellow, with a touch of Spanish brown. Buff—Two parts spruce, or Indian yellow, and one part burnt sienna.

A NEW FUEL FOR THE PRAIRIES.—An inventive genius of Pocahontas, Ind., grinds corn-stalks and coarse prairie grass together and moistens them with water. When this compound has been reduced to pulp he presses it into blocks 12 inches long and 4 inches thick. When these are thoroughly dried they burn readily, and, it is claimed, give more heat than the same amount of soft coal.

JAPANESE NEWSPAPER REPORTERS must have good memories. It is said that they do not write anything themselves, but gather the news and tell it to the news writers. Japan has 250 newspapers, 1000 miles of railway and 2000 or 3000 miles of telegraph line.

RAPID INCREASE OF VALUES.—The assessment-roll of Fresno county for 1888 shows a total of \$38,657,000. In 1887 the amount was \$16,922,586. According to the school census, the population of the county is fully 40,000.

IT PAYS.—It is said that Ignatius Donnelly has made \$100,000 from the sale of his book, and yet there are those who call his alleged discovery a failure.

ENGINEERING NOTES.

THE NOVA SCOTIA SHIP RAILWAY.—Mr. Benjamin Baker, one of England's most celebrated mechanical engineers, recently visited the Eastern States and Canada in the interest of the proposed ship railway across the northern portion of the peninsula of Nova Scotia. Mr. Baker is an enthusiastic supporter of ship railways. While on a visit to Pittsburg, he met Col. James Andrews, the chief engineer of the Tehuantepec Ship Railway Co., to whom he remarked: "My visit to America is to submit the plans for a ship railway across the isthmus of Chignecto, in Nova Scotia, to the Minister of Public Works of Canada. They have met with his entire approval, and I sail for London on Saturday to make a report to the syndicate of English capitalists who are backing this scheme. The work on this railway will likely be commenced in the coming month of July, and will be finished, it is expected, within two years' time. The total outlay will be \$5,000,000, all of which has already been subscribed, the Canadian Government guaranteeing in return an annual dividend of \$175,000. The railway will be 17 miles long, and, owing to the heavy tide in the Bay of Fundy, which rises at times as high as 70 feet, ships will have to be raised 42 feet by hydraulic pressure. The largest vessel that we will be able to take across will be 2500 tons burden. The Tehuantepec railway will endeavor to carry ships of 4000 tons burden, but they will have to be raised only 14 feet. In other respects the smaller railway in Canada will be similar to the one in which Col. Andrews is interested. This Canadian road will be of much benefit to the marine traffic between the Gulf of St. Lawrence and American ports. It will save a distance of 600 miles of ocean travel. I think that the ship railways will be a success."

DE LESSEPS AND HIS CANAL.—De Lesseps is either the most sagacious or the most fortunate of engineers which the world has produced. No other man ever lived who could have pushed such an enterprise as the Panama Canal to such a favorable point of success as that great work now holds. The work has been carried on under most discouraging and unexpected obstacles, both physical and financial. More than once the best engineers have thought that a crisis had been reached which no energy or skill could possibly overcome. But De Lesseps has triumphed every time. The recent reported failure of the lottery scheme and the violent opposition of a heavy financial syndicate, seemed, a few days ago, to have crushed out all possibility or hope of success; but late telegrams announce that the great engineer has once more triumphed, and is now in a position to fairly command success. He has become reconciled to Christophel, Governor of the Credit Foncier, whose persistent opposition was the principal cause of the great difficulty lately in placing Panama lottery bonds. The Credit Foncier will now receive 120,000,000 francs, the sum which is necessary for the company to meet its regular payments due on bonds. The opposing interests are harmonized, and there will be no more troubles with the new loan.

THE EADS JETTIES.—A recent examination of Captain Eads' jetties on the Mississippi, below New Orleans, shows that they are entirely successful in preserving the depth of the channel. For two and a half miles they reach out into the gulf, opening a broad channel navigable by steamers drawing 30 feet of water. The outer line of defense against the encroachments of the waters of the gulf, which was made of artificial stone, proved insufficient, as both sea and sand broke over it. Then an inner line of defense was made by driving two rows of cypress piles deep into the sand, laying a willow mattress between them and loading it down with loose rock. The sea and sand continued to break over the outer stone wall, but as each wave receded the sand was imprisoned between the inner and outer walls till a barrier was formed, which promises to withstand the ravages of the gulf storms for all time. Behind the right-hand jetty a great stretch of shoal has gradually grown into solid beach, extending its shore-line seaward till it is nearly flush with the extremities of the jetties.

THE LARGEST DRAWBRIDGE in the world is now being erected by the Baltimore & Ohio Railroad Company over the Arthur Kill. This draw is to be 512 feet long, allowing a clear space of 200 feet on each side of the draw between the piers. This bridge will give to the Baltimore & Ohio and other trunk lines access to 10 miles of water-front of Staten Island. The entire length of the bridge from shore to shore is 800 feet and its height is 30 feet. The draw, which is operated by steam-power, alone weighs 450 tons. The total cost of the structure is \$450,000. Trains will pass over the bridge in December next.

DETERIORATION OF STORAGE BATTERIES.—It is reported that the storage batteries on the Brussels tramway have deteriorated so that the cost is increased to nearly 11 cents per car mile, as against 10 cents for horse-power.

There is no doubt that electric railways are growing in popularity. The advocates of other systems must look to their laurels.

The South African diamond-fields last year yielded gems valued at over \$20,000,000.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH CONSOLIDATED.—*Ledger*, July 21: A report was current last week to the effect that the mine was to be opened on Monday last, but that day passed without anything being done in that direction. It is generally believed that the fire is out. It is said that it would be next to useless to open the mine now, as by the time they got it in running order the failure of water supply would compel them to close again. Under these circumstances it is perhaps thought best to keep the mine closed, and thereby insure beyond a doubt the extinction of the fire, until the approach of the fall rains gives a promise of enabling the machinery to be kept running. Nothing, however, is definitely known as to the intention of the managers.

AMADOR GOLD MINE.—The superintendent of this mine hands us the following account of operations: While this company does not work as many men as some others on the lode, yet it keeps steadily at it, with a force of about 20 men. The rock in the mine of late has been very hard, and the work in sinking and drifting has not advanced as fast as we would like, but now that we will soon have three National drills at work in the mine, we will be able to make much better progress. The compressor, wheel-pipe and lumber are now on the ground, and millwrights are at work setting it up, under the supervision of J. B. White & Co., who have just finished the liex 40-stamp mill. The south or shaft No. 3, where the large hoisting works are to be erected, is down 180 feet. The south drift from shaft 1 to connect with the south shaft is in about 210 feet, and the west crosscut from shaft No. 1 is over 350 feet. We expect to cut the west vein about 30 feet further on. The company has secured a fine mill-site from the Amador Queen, at the lower end of the Doyle mine, where it gets 400 feet pressure for power, which will save the company at least \$1000 a month in water bills. The company is now grading for the mill, and lumber is being delivered on the ground. A force of men is at work on the road to the mill-site. The contractors, J. B. White & Co., will commence on the mill as soon as the compressor is finished. The Pacific Iron Works of San Francisco has the contract to furnish all the machinery. A large rock-breaker of the Gates pattern, with a capacity of 300 tons daily, will be put in the mill 90 feet above the lower floor.

MISCELLANEOUS.—W. G. Anderson informs us that the New York claims, three miles southwest of Jackson, are looking well. The tunnel is being pushed ahead, and rock of good grade has been taken out. The Live Oak mine near Stony creek is also looking more prosperous than ever. The drift at the depth of 180 feet in the main shaft has revealed the ledge richer and larger than heretofore encountered.

SUTTER CREEK.—*Cor. Amador Ledger*, July 21: Sinking in the Wildman is making rapid progress. The ground is found to be quite soft, and hence the deepening process goes ahead speedily. There are two shifts of eight hours each employed in sinking. Another shift of eight hours is employed in hoisting rock for the mill. By this system they expect to keep the mill running steadily, and thereby take out sufficient gold to defray the expense of sinking.

Butte.

SPRING VALLEY MINE.—*Oroville Register*, July 21: This rich and well-known mine is having a streak of hard luck this year between injunctions and attachments. Supt. Gregory has made it pay handsomely, but so soon as the mine released from one lawsuit than another comes forward. While we have hopes that Mr. Gregory will be able to get into smooth sailing after a little with his big craft, yet we have serious doubts about the mine being able to stand the storm that is now breaking over it.

Calaveras.

LEONARD.—*San Andreas Prospect*, July 20: It is reported that the Leonard quartz mine will soon be opened, as arrangements are now being made to develop this valuable piece of property. Excellent rock is already in sight and as the shaft is being sunk deeper the prospects are more and more flattering. The new steam engine to be placed on Blue Lead Spinolet & Co. mine was steamed up Tuesday evening and gave entire satisfaction to the owner. The Thorn mine is making great progress. Hoisting works are now being erected, and the mine is already working night and day shifts.

El Dorado.

SUSPENDED.—*Georgetown Gazette*, July 20: We understand that work at the Alpine mine has been temporarily suspended. Mr. Morton, the superintendent, has been in poor health for some time, and work on the mine has been stopped for awhile to allow him to regain his health.

Inyo.

SODA WORKS.—*Index*, July 18: Mr. John Fiehm tells us that the Inyo Development Co. has recently erected a 30-foot windmill for the purpose of pumping water from Owens Lake into the evaporating vats. The water is raised 15 feet in quantity, sufficient to fill the flume, which is two feet in width and 20 inches high. There are about 15 acres of vats which are filled to the depth of six to ten inches and evaporate in 24 hours. As there is wind every evening, the windmill does about all the work required in raising water, but when it is found insufficient the steam engine is used. It is understood that the Inyo Development Co. will soon erect soda refining works at or near Keeler.

BISMUTH.—*Independent*, July 21: A prospector named Cunha has made what promises to be a lucky find over near Deep Spring, in the Inyo range. He struck a vein of metal that was new to him and he couldn't tell what it was. He sent samples to Selby & Co., who assayed them and reported that the metal was bismuth, and the ore carried 50 per cent of that metal. Cunha is now taking out a quantity of the ore which he will send to Selby & Co. as a working test. There appears to be a large body of the ore in sight.

Lassen.

HAYDEN HILL.—*Lassen Mail*, July 21: There are two 10-stamp mills at work here (Harbert & Lewis having added their battery to that of Howard

& Preston), and one arastra, which is operated by Flucet and Geo. McFarland, and a little of the hidden treasure is unearthed day by day, adding to the wealth of the country.

Napa.

THE AETNA MINE.—*Calistogan*, July 20: Business at the Aetna quicksilver mine is again quiet. The furnace was shut down more than two weeks ago, and the usual cleanup following such act was finished Saturday last, at which time the company had on hand 100 flasks of quicksilver. Fifty of these were shipped to San Francisco Monday last. Mr. Rhodes, the superintendent, hopes to find more cinnabar, and some prospecting is being done, but parties interested in the mine do not feel disposed to risk much capital looking after more ore. A great deal of metal has been taken from the Aetna company's ground during the past few years, and stockholders must have realized very fair profits.

Nevada.

A GOOD MINE.—*Nevada Herald*, July 20: Melville Attwood went down into the Nevada county mine to-day and was well pleased with the appearance of the ledge at the bottom. Though small, it has every appearance of a fissure vein, and the rock is of unexceptionally good quality. Mr. Attwood speaks encouragingly of the prospects there. He has several times visited the mine when it was in operation and says it is undoubtedly a good mine and would pay well with systematic work and good business management. Tributaries in the Gold Tunnel and California ground have made a crushing of about 20 tons, which yielded in the neighborhood of \$30 per ton.

WASHINGTON DISTRICT.—*Grass Valley Union*, July 20: Alf Tregido, who is superintendent of the Washington and Blue Bell quartz mines in Washington district, and who was in town yesterday, spoke well of the mining outlook of that section of the county. He said besides the mines under his superintendence the Yuba mine was running regularly, making the number of stamps constantly going at 45, and that there is a likelihood of the Eagle Bira mine starting up again this season, which would add 20 more stamps to the milling capacity of the district. There is considerable prospecting work going on all the time, and the district is receiving much attention from mining men, as although the ores are generally of low grade the lodes are large, and water-power affords cheap milling facilities. The mines now operating are doing well, as ores yielding only \$6 and \$8 per ton can be milled and mined at a good profit. There is no question that the Eagle Bira is a valuable mine, and its present idleness is owing to the unbusinesslike methods on which it is conducted, and not from the unproductiveness of the mine.

Placer.

MAYFLOWER.—*Placer Argus*, July 21: F. Chapellet, superintendent of the Mayflower, reports good gravel at the Live Oak, some of it paying as high as \$5 to the pan. The company has just reached the rim where the way was anticipated.

BREECE & WHEELER.—Work was interrupted in the Breece & Wheeler mine at Bath last week, by the falling in of the timbers. The break is now nearly repaired. They are working about 25 men at present.

MILL SOLD.—The Plantz quartz-mill at Ophir has been sold to some gentlemen who are moving it to Plumas county.

THE DORRER MINE.—*Nevada City Herald*, July 20: Seven miles from Alta, on the north fork of the American river, in Placer county, there has been some extensive prospecting done for the past 5 or 6 years on the ledge known as the Dorrier. The owners are Wm. Sexton, Geo. D. Dornin, M. M. Drew, H. D. Chase and W. L. McEwen. Last fall work was commenced putting in a dam for water-power and the erection of a 10-stamp mill, which was all completed about the middle of April. The ledge is in a slate formation and is a north and south vein. It runs from two to 20 feet in width. The ledge runs up a mountain from the river and the upper portion of the claim is 2000 feet above the river level. The opening where ore is now being taken is 3000 feet from the river, at an elevation of 1400 feet. From this point the rock is transported to the mill, which is on the river, on a tramway 3100 feet long. One tunnel is in 210 feet and another is 100 feet, and still another 50 feet. Rock for milling purposes is being taken from all these tunnels. The mill is run by free water-power. The rock is low grade, running from \$3 to \$7 per ton. The gold is very fine quality, being worth \$17.50 an ounce. The size of the ledge, its near proximity to free water, and the fact that fully 2000 feet of backs can be worked by tunnel, make this a very promising property.

San Diego.

JULIAN.—*Julian Sentinel*, July 20: The High Peak mine has been located by Messrs. J. Marks, Duncan Ferguson, H. Garland and S. L. Ferguson, and the work of opening up the old tunnel will be commenced next week. It is a noticeable fact that of all the mines which have been opened around Julian, there is but little quartz lying on the dumps, it all having been milled. This is a good sign, and shows that what rock was taken out was paying. Joe Marks went out Wednesday forenoon and surveyed a new mining claim located by a stock company composed of Charles Hale, S. L. Ferguson, Joseph Decker and Joseph Marks. The quartz now on exhibition contains copper, iron, gold and silver.

Sierra.

MOUNTAIN.—*Tribune*, July 20: Fifteen men are employed at the Mountain mine under the foremanship of Wm. Jenkins. No. 2 tunnel is being pushed ahead, but it will take some months yet before the ledge is reached in that quarter. In what is termed Harry Warner tunnel, work is also progressing. The ledge opened up in this tunnel is from 12 to 15 feet wide and yields big prospects in free gold.

NEW TUNNEL.—The new tunnel at the Sacred Mount mine is in about 70 feet. It is expected that the ledge will be reached within two weeks.

YOUNG AMERICA.—*Mountain Messenger*, July 21: Forty stamps are steadily running at the Young America quartz mine, and 125 men employed. There are four boarding-houses for the miners. Under the able direction of Stephen A. Moore the work progresses favorably.

NEW COMPANY.—A company has been formed to develop the gravel claims on Humbug creek, near

Indian valley, owned by Jerry Watts. They have been bonded for four months, and meantime will be thoroughly prospected. At the expiration of the bond the parties interested have the privilege of taking all or a certain portion of the ground. Work will be commenced next week.

Shasta.

GOOD GOLD ORE.—*Shasta Courier*, July 21: Frank Panter, of the firm of Garreth, Panter & Yung, owners of the Mammoth mine in Old Digging district, went to Selby's Reduction Works last week with two carloads of ore. The selected ore went \$107.83 to the ton, nearly all gold, and the unassorted went over \$100 to the ton. The boys have 1000 tons of quartz on the dump, just as rich as that sent down, and any quantity more in sight in the mine. As they are not practical millmen, we understand that they would be willing to sell their ore at the dump or have it worked on shares by a competent and reliable operator.

POCKETS.—Several pockets of free gold have recently been struck on Rock creek, and miners who have "walked right over them" for years are disgusted. It takes diggin' to find "pockets," and then when they are found, oftentimes there is not enough in them to pay for a week's grub and a plug of smoking tobacco.

Siskiyou.

MINE-OWNERS.—*Yreka Journal*, July 21: Our mines are the main prop of Siskiyou county, and those of our citizens who are engaged in mining are entitled to much credit for the good they are doing. Probably the heaviest mine-owner in the county is George Smith of Etna, who has been at the head of nearly every large mining enterprise in Scott valley and on Salmon river that has been inaugurated during the past few years. To him and such enterprising men as Hon. R. H. Campbell, Ball & Co., Wright & Fletcher, Eastlick Bros., Hon. John Daggett and many others, Scott valley owes a part of its present prosperity.

CHROME.—*Yreka Journal*, July 21: A superior quality of chrome ore has been found in the Forest House mountain, six miles south of Yreka, but no regular ledge.

CRUSHING.—The old Warren quartz-mill is now in running order, and commenced Monday in crushing quartz hauled there from the ledge of Mills & Co. at Humbug gulch. Other parties have considerable quartz on hand for crushing, as their turn comes. A four-foot quartz ledge has been found at the Shasta county line on railroad, by W. J. Root and others, which contains considerable silver and some gold. The last cleanup of the Mountain Laurel quartz mine, at Salmon river, realized \$30 a ton. The Black Bear mine at Salmon river looks well at present, and will no doubt pay well at next cleanup from present crushing. Radefinger & Co. have a fine three-foot ledge at Know Nothing creek, which pays rich, and Hensen & Co. and Clark & Co. also have rich ledges on the same creek. York & Ball, of Methodist creek, have a rich ledge containing both silver and gold, and there are several other companies at work on Know Nothing and Methodist creeks, all doing well.

Trinity.

EAST FORK.—*Journal*, July 21: Capt. C. P. Weaver informs us that the mill which is in process of construction on the Golden Chest mine, at East Fork, will be completed about the first of September. If satisfactory arrangements can be agreed upon in reference to some of their mines by that time, work will be pushed and ore crushed as rapidly as possible; if such arrangements are not made, development work will be done on some of the locations that the company has, until such time as an agreement is reached. This company is doing much for the camp of East Fork.

RUNNING A TUNNEL.—Joseph Falan of Deadwood is at present running a tunnel to tap his recently discovered ledge. In 17 days he run 100 feet, and about 150 or 200 feet more will have to be run before the ledge will be tapped. Mr. Falan says the ore prospects well and he has a great deal of faith that it will prove to be a good mine. It is farther south than any that has been discovered about the old Vermont mine and is thought to be an extension of the Montezuma ledge, recently purchased by Wm. T. Coleman & Co.

Tuolumne.

MEN AT WORK.—*Tuolumne Independent*, July 20: Hayward & Hobart have placed a force of men at work on the Eureka Consolidated, near Summersville, intending to get everything in readiness for working the property on a large scale. This mine is ranked by experts as one of the best in the county, and should the venture prove a financial success, it will be a God-send to those holding mines in that district, and a help to the county in general.

HOISTING WORKS.—The new hoisting works on the Black Oak of Soulsville have just been completed, and part of the mile of pipe has been laid. The company expects to soon have the new machinery going.

Ventura.

SILVER ORE.—*Ventura Democrat*, July 19: Chas. Ostrom brought some specimens of silver ore to this office during the week, which were taken from a location he has just made in the vicinity of Frazier mountain, that contained a fair amount of silver. Mr. Ostrom has made a location on the ledge which he will begin prospecting in a few weeks, and hopes to develop a valuable mine.

NEVADA.

Washoe District.

BEST & BELCHER.—*Virginia Enterprise*, July 21: El Dorado level: The main northwest drift from the main west drift has been extended 58 feet; total length, 468 feet. The formation is clay and porphyry.

CON. CAL. VIRGINIA.—The upraise from the 1500 level is in low-grade quartz. The north drift from the north stopes on the 1500 level is in vein porphyry that shows bunches of good ore. A south drift from the Ophir east crosscut on the 1500 level is now in Con. Cal. & Virginia and is in ore of fair grade. The ore shipped during the past week will show about the usual average assay value a ton. The California mill will start up next week.

OCCIDENTAL.—Upper tunnel: One hundred and fifty feet below the upper tunnel, in the boiler winze, the north drift has been extended 10 feet;

total, 48 feet. The south drift has been extended 8 feet; total, 18 feet. Lower tunnel—Seventy-five feet south of the north incline winze, the incline upraise has been carried up 17 feet; total, 157 feet. One hundred and fifty feet south of the same winze the south drift has been extended 7 feet; total, 130 feet. In the winze leading to the lower level, 50 feet below the lower tunnel, the north drift has been extended 8 feet; total, 31 feet. Extracted 90 tons of ore. Shipped to the Atlanta mill 125 tons ore, the wagon assay value of which was \$27 a ton.

GOULD & CURRY.—El Dorado tunnel: West crosscut No. 2, started from the main southeast drift, has been extended 39 feet; total length, 90 feet. The formation is quartz, giving low assays. The south drift from west crosscut No. 2 has been extended 23 feet; total length, 55 feet. It is still showing milling ore. During the week there have been extracted from the 250 and 300 levels, and shipped to the Douglass mill, 265 tons of ore, the average battery samples of which were \$25.81. Shipped to San Francisco office bullion of the assay value of \$3132.25.

HALE & NORCROSS.—All the stopes throughout the mine are looking very well. No. 1 east crosscut on the 400 level has been advanced 20 feet, making a total length of 45 feet. Good headway is making with the new station on the 500 level. The milling troubles prevent the usual extraction of ore at the present time.

BELCHER.—Work has been resumed through the old shaft by means of the new hoisting machinery. The east crosscut on the 500 level continues in fair vein material. Good headway is making in the connecting drift that is being driven from the Sutor tunnel, though the rock continues very hard.

ENCHEQUER.—On the 122 level the northwest drift is out a distance of 70 feet. The face is in quartz. The east crosscut on the 222 level is out 250 feet, with the face in clay and porphyry. The north lateral drift on the 380 level is out 360 feet. The face is in clay and quartz.

CHOLLAR.—The oorth raise from the 650 level is up 65 feet, and is in fair grade ore. On the 450 level the north drift is out 25 feet. The face is in low-grade quartz. The electric station on the Sutor tunnel level will be completed in three or four days.

POTOSI.—The south drift on the 65 level is out 240 feet. On the 550 level the south drift is out 675 feet. The face is in quartz giving low assays. East crosscut No. 2 on the 550 level is out 90 feet, and the face is in clay and porphyry.

SAVAGE.—The stopes on the north and south drifts on the 400 level are still looking and yielding well. Good ore is also found in the south drift on the 500 level. The low stage of water prevents the usual extraction and shipments of ore.

CROWN POINT.—Good progress is making in the north drift started to cut the ore found in the raise above the 600 level. On the 700 level the east crosscut continues in a mixture of clay and porphyry with some seams of quartz.

SEG. BELCHER.—Paying ore is being found in bunches and feeders in the raise above the 1300 level. The indications are good for finding a large body of paying ore in this part of the mine.

YELLOW JACKET.—The shipment of ore has been discontinued on account of the low stage of water in the Carson river. The usual exploring and development work is being done.

UTAH.—On the 372 level, opposite the south drift, the north drift has been extended 50 feet; total length, 258 feet. This drift continues in a porphyry and quartz formation.

IOWA.—Preparing to open a level from the main shaft on the south side of the mine to explore the vein stripped in the south drift from the McBec tunnel at greater depth.

BALTIMORE.—The prospecting drifts on the 300 level are developing feeders of good ore. The pumps are running well and smoothly. They handle the water very readily.

SIERRA NEVADA.—The west crosscut from the main south drift on the 520 level is out 60 feet. The face is in vein material composed of quartz, clay and porphyry.

WEST YELLOW JACKET.—Good progress is making in the upraise which is to connect in a few days, where it is thought good ore will be found.

ANDES.—The usual prospecting work is being done on the 240 and 350 levels. Some bunches and stringers of fine ore are being found.

UNION CON.—The face of the north drift from west crosscut No. 2 on the 1030 level is still in vein material of a promising character.

WEST CON. VA. & CAL.—The new hoisting plant is working well and good progress is making in sinking the main shaft.

ALTA.—The stamps and concentrators are kept in constant operation. The mill works about 25 tons of quartz a day.

LADY WASHINGTON.—The crosscuts from the raise above the 725 level are in quartz carrying some metal.

BULLION.—Good headway is making in the main south drift from the bottom of the winze on the 640 level.

MEXICAN.—East crosscut No. 1 from the main north drift on the 1300 level is still in vein porphyry.

BENTON.—The only work being done is on the 725 level, where some prospecting is in progress.

ALPHA.—The main shaft has been sunk and timbered to a point 90 feet below the 380 level.

SCORPION.—The south drift on the 400 level is out 378 feet. The face is in vein porphyry.

OPHIR.—Upraise No. 2 on the 1465 level is in a mixture of quartz and porphyry.

IMPERIAL CON.—The south drift on the 1100 level is being reopened and repaired.

Eureka District.

COPPER.—*Eureka Sentinel*, July 21: The owners of the Silver Connor mine, on Prospect mountain, shipped to Salt Lake during the week trial samples of one ton of copper ore, and ten tons of iron gangue gold ore, the results from which we will furnish to our readers as soon as they are received. From 350 to 390 cars of material are handled during 12 hours of the day at the Eureka Con. slag dump by means of the new hoist, and in order to push work, with greater dispatch, hoisting in the future will be continued during the night. A shed has been built over

the engine. We learn that the Silver Lick mine on Adams Hill never looked so well as it does at present. The tributaries have lots of ore, and from reliable sources we hear that a great deal of it is very rich.

Jefferson District.

LEACHING.—Belmont *Courier*, July 21: The Kanrohat mill and leaching works at Jefferson are running nicely and producing bullion. The miners of that district are all busy developing their claims and extracting rich ore.

San Antonio District.

PRODUCING.—Belmont *Courier*, July 21: The New Year mine is producing its usual amount of good ore.

Tuscarora District.

BELLE ISLE.—*Times-Review*, July 21: The usual amount of ore has been taken from the stopes.

NEVADA QUEEN.—The south drift from the 150-foot level of Commonwealth has advanced 15 feet in very hard rock. A joint upraise has been started near the line and extended up 12 feet, exposing fine ore all the way. The 350-foot stopes have been extended both north and south. North, the ore continues and looks well; an upraise has been put up 18 feet at the extreme north end of the stopes, in which an ore chute will be made. South end stopes are within a few feet of North Belle Isle line, the ore being high grade; in fact, all the stopes look as well as at any time heretofore. The south intermediate, 90 feet below the 200 foot level, is following the ore, which is very high grade. The 450-foot level is being opened up through the North Belle Isle, they having driven their drift to the line, where it was turned over to the Queen. The ore is very high grade, carrying 33 per cent gold. Seventy tons sent to the North Belle Isle ore-house average assay from car samples, \$210.31 per ton; 279 tons of concentrating ore hoisted to the surface, average assay from car samples, \$25.59 per ton.

COMMONWEALTH.—100-foot level: A drift was started and run 15 feet north from No. 1 east crosscut, following the ore, which is two feet wide in the face, assaying from \$40 to \$55 per ton. This drift has been stopped, and a drift south started on ore, to connect with the upraise from south drift 150-foot level. This raise is near the line and has been extended up 12 feet, exposing very fine ore all the way. A prospect shaft has been started on the eastern part of the mine and has been sunk 20 feet, following a vein of chloride which has widened out to six feet of low-grade ore. Mill is running all right and doing good work. Average battery assay \$478.98 per ton.

GRAND PRIZE.—West drift, 200-foot level, extended 13 feet. Face showing two feet of good chloride ore. Stopes above the 200-foot level are looking well. The ore is now turning from sulphure to chloride as they ascend and the vein increasing in width. The drifts on this level are now timbered for about 250 feet and stopes started the entire length. Stopes above the 300-foot level are yielding the usual amount of sulphure ore.

NORTH BELLE ISLE.—Good progress has been made with the work at all points. Work on the concentrating plant is under good headway.

FOUND TREASURE.—The usual amount of ore has been taken out and sacked ready for shipment.

Tybo District.

TO START UP.—Belmont *Courier*, July 21: It is expected that the Nye Mining Co.'s mill will soon be started up on ores from the 2G and other mines of the district.

ARIZONA.

NOTES.—Prescott *Courier*, July 19: John Curtin, who is tunneling in the Lion lode for Mr. Leavick, has bored into it about 100 feet, and speaks encouragingly of the vein. It is of good size and quite rich. Col. Bean is better satisfied with Copper Basin than ever before. Ledges are growing in size and richness. Mr. Williams, the superintendent, is also in a pleased mood. Two routes for a narrow-gauge railroad have been examined. The shortest is 15 miles. Miners from Tipton are here with ore and say they can do better by bringing ore here than by shipping it south. Mr. Van Name of Big Bug was here yesterday. He said his mill is doing first rate. The Tuscumba and Del Pasco mills are running regularly. Messrs. Cockburn & Jungk are en route to Eureka district, where a smelter may, ere long, be put up and run. Van Name's mill is making a successful run on gold rock. Another smelter will soon be running out copper at Jerome.

ORE SHIPMENTS.—Prescott *Courier*, July 9: Aleck Thompson, whose teams have been hauling ore to the Etta mill, has arrived here. Aleck thinks he can make more money hauling machinery for Mr. White, of the Boaz mining company. He says he left the Etta running nicely. Four of Shull & Austin's big teams came in Saturday last from the Congress mine, with ore which will be shipped by the Arizona Ore Co. Same teams will take machinery to the mine. C. Douglas Brown has a contract for erection of the Senator mill. Machinery is at the depot. Capt. Brann is running the Wonder mill in Turkey creek district, on gold ore, which, it is said, pays pretty well. A check for \$15,282.15 was recently paid one individual, for ore, by the Arizona Ore Co. of this place. Joe Chambers, who is taking out ore in Big Bug district, will have it worked in Van Name's mill.

COLORADO.

NEW DISCOVERY.—Elk Mt. *Pilot*, July 20: A new discovery was made a few days ago in the Rainbow lode, situated on East Brush creek, and Mr. Robie, the owner, is very happy over it. The tunnel was driven through very hard quartz, when all of a sudden the drill struck into a soft, decomposed matter, and on examination by those who claim to know, the decomposed matter is sand carbonates. Other mine-owners in the vicinity have courage and prospects on Brush creek are very hopeful. Messrs. Wyckoff and Frost are very much pleased with the developments on one of their Brush creek properties. They were driving the tunnel on the footwall on a very fair streak of mineral, when Mr. Wyckoff took a notion to crosscut for the hanging-wall. He started to follow a small crevice which eventually led to the hanging-wall and also disclosed a pay streak of mineral, that is evidently the main pay streak. Returns have been received on the carload

of Sylvanite ore shipped to Pueblo, which netted here \$2500. While that is pretty good and certainly rich ore, it was not up to what was expected from the Sylvanite. Other shipments will be made at once, and all concerned will soon be considerably relieved. Supt. Murphy has a force of 19 men employed at present, and is doing some good work. There will soon be quite a large ore traffic from the breaker when the Augusta gets to shipping and what ore comes from the Daisy is loaded there. This mine loads three cars this week.

DAKOTA.

CASTLE CREEK.—Deadwood *Pioneer*, July 15: Encouraging news has come from the Castle creek mining camps the past week, the reliability of which cannot be questioned and which must surely stimulate mining in that part of the hills to a great degree. Mention was made of the new strike in the Castle Creek, and of the excellent condition and prospects of the Lookout. The amount of work done by the present management of the Lookout to get it in working order is considerable, amounting in round figures to nearly \$5000. The tramway was badly out of repairs, and had to be reconstructed and rendered safe, and the flume required considerable repairs also before it would carry the water satisfactorily. There is no better flume or tramway in the Black Hills now, probably, than those of the Lookout. One of the chief difficulties in the way of the successful treatment and saving of the ore of this mine is the presence of plumbago in many of its ore bodies. The bodies of ore in which this substance is found are the richest in the entire property; several large tunnels have been opened up in all of which plumbago is found in large quantities, and being of a black, greasy nature, is difficult to separate from the gold. The former company found it almost impossible to work this ore, but Prof. G. E. Bailey, who is connected with the present company, has discovered a plan whereby the plumbago may be successfully separated from the ore at very little cost. He is now preparing plans of the additional machinery to be presented to the company for their approval. There is little doubt that the plans will be adopted. If this substance can be moved with little cost, ore assaying from \$5 to \$6 per ton can be found in unlimited bodies almost, all of which can be worked.

IDAHO.

SILVER MOUNTAIN.—Idaho *City World*, July 18: The Julia and Cleveland mines being developed by the Silver Mountain Mining Co. now loom up grander than ever before. All old quartz miners who have visited these locations give the same accounts of the ore bodies as to the quality and quantity, and all predict that Silver Mountain district will prove to be one of the greatest quartz camps in North America, and their predictions are backed by mountains of quartz, the croppings of which make July as good a showing as did the croppings of the Julia and Cleveland. The coming fall, the mill, one of the finest in the Territory, will be making music in a section that a little over a year ago was a silent, solemn wilderness. A tramway, over a mile in length, will carry the ore to the mill. They have 13 locations, and two of them have been sufficiently developed to prove that they are mines of great value.

ANOTHER MILL TO BE STARTED.—Wood River *Times*, July 18: Superintendent Bailey, of the Champion Mill and Mining Company, was in town to-day. He stated that his mill would commence crushing between the 1st and 10th of August. He says that he has solved the water question and that he has now more water at his mines than there is in Camp creek, which is dry.

MONTANA.

AROUND BUTTE.—*Miner*, July 18: Operation have again been suspended on the Amy & Silversmith. The new amalgamating pans that have been placed at the Silver Bow mill will be ready to start Monday morning. Drifting is in progress on the ledge at the 250-foot level of the Hope with a very fine showing. The hoisting of ore on the Anselmo will be resumed in a few days, as a large body of first-class ore is known to exist there. The ore of Butte shaft is sunk to 100 feet and sinking still continues. A crosscut was run in on the 100-foot level before going any deeper and a strong body of ore developed that encouraged further progress. The masonry work on the foundation for the Frazer & Chalmers engine at the Goldsmith mine has been commenced. Crosscutting has begun at the 200-foot level of the Volunteer. This is one of the most promising prospects in the camp. The Mountain View mine is producing its regular quantity of ore. The Parrot is at present down 700 feet, producing its regular quantity of ore to supply the second largest smelter in the Territory, which, besides, does much custom work. One of the largest shafts being sunk in this district is that on the Green Mountain, situated midway between the Mountain Consolidated and Wake-Up Jim. At present it has attained a depth of 200 feet. Three eight-hour shifts of eight men each are at work on it. When the shaft has been sunk to the required depth the largest pump in the camp will be erected, as well as the largest hoisting works in Montana, which will be capable of hoisting all the ore from the Mountain Consolidated, Wake-Up Jim and Green Mountain.

BEARMOUTH DISTRICT.—Phillipsburg *Mail*, July 21: James Early of Bearmouth arrived in the Burg Tuesday evening. He reports plenty of water so far in the placer-mining regions of this section, and that work has been going on uninterruptedly during the entire spring and summer and that it will probably continue for some time to come. People owning quartz ground are beginning to awaken.

HATTA.—Louis J. Hendrikson states that reports received at New Chicago from several of the mining men in from Dunkleberg district, announce that things are looking exceedingly well at the Hatta mine. The contractors at work sinking the shaft have come across some excellent ore.

BLACK PINE.—The mine of the Butcher Bros. in this district is proving to be quite a valuable property. A recent strike is reported as having been made, in which some very valuable ore has been encountered, the mine looking better at present than it ever has.

SAN FRANCISCO.—Operations still continue in this mine and the indications are still as favorable

as it is possible for anything of the kind to be. The ore that has been shipped and is still on hand to be shipped is of a very rich character.

AT YOGO.—*Inter-Mountain*, July 21: T. E. Collins informs the Great Falls *Tribune* that he has made arrangements for putting in a small mill to work the ores of the Golden Chariot and other gold-bearing leads owned by him in Yogo. Mr. Gardner of Maiden puts in the mill and will operate it. He can put through eight to ten tons of ore a day and clean up monthly a nice lot of the "shining metal." This will be an important acquisition for Yogo and will help to bring that camp to the front.

THE CASTLE SMELTER.—The construction of the smelter is rapidly going forward under the push and energy of the superintendent, Mr. King. The frame was raised last Friday and the building is nearly inclosed.

AT SUNSET PEAK.—On the Custer lode, near Sunset Peak, the Porter brothers struck a ledge four feet wide in their tunnel. The ore assays \$200 per ton.

NEW MEXICO.

MOUNTAIN KEY.—Silver *City Sentinel*, July 21: The Mountain Key Co. is now working two full shifts—night and day—and has re-employed a large force of men. Bell & Stephens made a run of 674 tons of Mountain Key ore and got 134 ounces of gold off the plates; the yield of the concentrates was between \$6000 and \$7000. The company is said to be in need of men. Air connections have been made in the Mountain Key mine. The ventilation is now perfect, and the working force of nine men increased to the full capacity of the mine. N. Bell, while in St. Louis, sold the Pacific No. 2 for \$75,000, part in cash and part in stock. During the short time Mr. Bell has had possession of this property he took out 471 tons which ran \$14,231.16; the cost of taking out was \$5608.15, leaving a net profit of \$8623. Large quantities of fine ore have been struck in various places in the Central City camp, but the great difficulty encountered has been from water, which usually appears at the 50-foot level. The locators are, as a general thing, poor men, and are not able to purchase the necessary machinery to keep the water out of the shaft and drifts. When capital is induced to invest in this camp, as it will be shortly, the Central City district will become one of the most flourishing in the Southwest. The recent discovery of extensive deposits of carbonates of lead in the Big Hatchet mountains in the extreme southwestern portion of the county is an event of great importance to Silver City and the country at large. The geological conditions are quite as favorable for large deposits as those surrounding Leadville, and it may be confidently expected that the developments now being made will prove the locations to be of more than ordinary value. A new mining district is among the latest of the late finds for the week. The discovery is lead in carbonate form of sufficient width and value to justify three of Leadville's old and well-known miners to open up and thoroughly explore the new district, which is located in the Diavolo range of mountains, north and east of Pinos Altos.

COPPER PLANT.—Silver *City Enterprise*, July 20: C. C. Fitzgerald of El Paso has organized a St. Louis company of \$500,000 capital to operate the International smelter at El Paso. A copper plant has been ordered. The Gipsy Queen mill of Shakespear district was sold last week by Sheriff Laird for \$873, the amount of the judgment and costs. C. H. Wilkie has finished moving one of the Bremen hoists to the Wagner mine of the same group, where it is now in running order. Milton Miller came in yesterday from the Alhambra, where they have made another strike of 15 inches of rich sulphides and native silver, equal to the lot first taken to El Paso. It will run over \$100 to the ton. The Thunderbolt prospect at Pinos Altos is showing up finely, although down only a few feet. The claim belonged to the Carter boys, but is being developed by St. Louis capital. The contract on the Golden Giant, the old Gopher mine at Pinos Altos, will be finished in a day or two. A mill run to be made, 150 tons being on the dump, and the owners expect to soon be working 30 or 40 miners. Since the last issue of the *Enterprise* two bricks have been shipped by Captain Cooney of Silver Creek, in the Mogollons, weighing respectively 26 and 30 pounds. The bullion contains quite a per cent of gold, which makes the bricks worth more than ordinary silver bullion. Captain Cooney has been short of water until the last week, but now has an abundance and will keep his 5-stamp mill running steadily from now. His mill is turning out about \$8000 per month at the present rate of shipment. Something over three miles of the workings of the Santa Rita copper mines have been cleared of water, leaving about ten miles of water still in the mines. It was estimated that the mines could be cleared of water in about two months and a half, but the pumps have not been working satisfactorily, hence more time will be required. Some of the timbering in the mine is in bad condition, which will be replaced by new timber now being sawed at the company's mill. As yet it is not known here when the company will resume operations, but it is probable that it will be very soon after the mines are cleared of water.

RELIEF HILL.—North San Juan *Times*, July 20: Relief Hill, 3 miles east of North Bloomfield, has seen flourishing days in its time and it is by no means dead yet. Formerly, before Judge Sawyer assumed the robe and scepter, the hill gave employment to 100 men; at present about one-quarter that number are working there. Among the drift claims (old hydraulic diggings) now in operation is the Eureka, which has yielded largely for 15 years and is at present producing satisfactorily. It is operated by Jepson Brothers. The Union is another gravel mine at Relief and its operation dates back 30 years. Messrs. Jepson, Morgan, Jerkinson, Rossan and Beck are of its shareholders. They hire several men. The Eureka Lake Co. also owns claims at the Hill, the Eagle being one of them. A good deal of work has been and is now being done on the Wakeshaw, in which are interested five gentlemen bearing the name Williams and three who answer to "Mr. Jones." These eight men are working partners, and are running a prospect tunnel at present. They expect to strike the channel some time now, as the bedrock in the tunnel is pitching steadily. The Wakeshaw workings are further in than has as yet been mined in this claim, and good ground is looked for shortly.

The Blue Lead is located north of the Wakeshaw, has a prospect tunnel in 2000 feet, and its workers hourly anticipate striking it big. In the vicinity of the Hill is a gravel claim known as the Bonanza. It was originally taken hold of by a company of 28. Two years ago the property was sold for taxes and was bought in by D. R. McKillican of North Bloomfield. T. P. Crandall also became an owner in it. These gentlemen commenced a still hunt for suitable parties with whom to associate themselves and form a company, in the meantime keeping up the assessment work so as to prevent their claim being jumped. The Derbec channel pitches toward the Bonanza's ground, and the owners of the latter are correspondingly elated. At present these owners comprise Messrs. D. R. McKillican, T. P. Crandall, John M. Williams, A. J. Ross, William Davis (foreman at the Derbec), Richard K. Jones, Thomas Harris of North San Juan, John Jones, D. Williams and Mrs. Hickman of Relief Hill. The Bonanza Co. has expended considerable money in surveying, etc., and but little opening-up work has as yet been done. It is the wish of the Bonanza's owners to deed half their ground to a party of men who will for that compensation develop the property.

OREGON.

GRANITE DISTRICT.—Bedrock *Democrat*, July 16: The Democrat office yesterday received a pleasant call from Mr. J. E. Sharp, an ex-newspaper man, and now owner of valuable mining properties in the Granite creek district. Mr. Sharp gives an interesting account of mining operations in his section, and tells us what has been done in the way of development work on the Golden Monarch mine, owned by himself and Wm. Graham. The Golden Monarch mine is about 20 miles southwest of Cracker creek in one of the best mineral districts in Oregon, surrounded with abundance of timber and water, and everything available for its successful working. Messrs. Graham & Sharp have been doing development work on the Golden Monarch for the past two years and have run a crosscut 160 feet in length, tapping the ledge, which is about four feet in width, at a depth of 125 feet, and run a level from that of 140 feet in length. On the middle of the ledge a surface tunnel has been run, tapping the ledge 40 feet deep. They are taking out ore and running it through an arastra, which averages, per 100 tons, over \$10 per ton. Adjoining the Golden Monarch is the Red Boy, owned by Graham, Hanlon & Mansfield, the ore of which is being worked by arastra, averaging \$20 per ton. Mr. Sharp has great hopes for the future of the mines of Granite creek and is content to await their development.

UTAH.

REVIEW.—Salt Lake *Tribune*, July 20: The week closes with the dolorous announcement of the shutting down of the Germania smelter, and the prospect of the other smelters in this valley following suit presently. The relief of \$3 a ton on railroad rats (which did not come till the day of the Germania shut-down) will probably have no effect on the question, as the rate is still higher on bullion than on ore, and ores from abroad are given better rates proportionately if they are sent beyond Salt Lake than if they are stopped here. The Germania shut-down will be a heavy blow to the business and industrial activity of this valley; if the others also shut down, as now talked, it will rise to the dignity of a calamity. Better railroad rates would give some relief; but the causes that operate against us lie even deeper, and a change in the rule of customs as to imports of lead ores is also essential to our prosperity. The receipts in this city for the week ending July 18th, inclusive, were to the value of \$99,993.26 in aggregate, of which \$75,585.11 was in bullion and \$24,408.15 was in ore. For the previous week the receipts were \$96,403.31 in bullion and \$37,245.67 in ore, a total of \$133,648.98. The product of the Ontario for the week was \$17,914.96 from ore sales, and of bullion 20,371.93 fine ounces, an approximate total of \$38,786.89. The Daily output for the week was of bullion, 10,957.47 fine ounces; no ore sales. During the week the Daly has declared dividend No. 17, of 25c. per share, payable July 30th. Receipts of bullion in this city for the week were valued at \$29,933.11; fine bars, \$30,152.02. The Hanauer smelter produced for the week \$175,500 in bullion. There are rumors that the Horn Silver smelter contemplates a resumption of sinking 400 feet lower, but the reticence of the management prevents a ratification of the rumor, which is not at all probable in view of the condition of affairs in the mining world. Ore receipts in this city for the week were to the value of \$11,450 by Wells, Fargo & Co.; \$11,600 by McCormick & Co., including \$1900 Queen of the Hills; and \$1353.15 by T. R. Jones & Co.

WASHINGTON.

THE IRON DEVELOPMENTS.—Ellensburg *Capital*, July 18: The Moss Bay Co., after examining the developments made in their iron mines in the Upper Cle-Elum district, concluded to prosecute work more vigorously, and this week have doubled their force. The mines are showing up better than was anticipated and the ledges wider, and the iron improves with depth. This is very encouraging to the owners and insures the establishment of the extensive steel works in Kittitas county at no distant day. The fact of continued development on a more extensive scale and the existence of the contract between the Northern Pacific and the Moss Bay Co., indicate that the works will be built in this county along the line of the Northern.

SEEKING MINES.—During the past few days, Ellensburg has been visited by several prominent mining men from Montana and Idaho, who came for the purpose of investigating the mineral resources of Kittitas county and the Concoquilly and Okanogan country. They are men of experience and means and have made their money by the development of mines and the working of ores in their respective Territories, and are willing to invest in mining properties in this section of the Northwest, providing they can find what they are seeking. The developments thus far made give promise of great results, but lack of capital has prevented the prospectors and early owners of the mines from opening them up on a scale commensurate with their promise and worth. As rich and extensive deposits of gold, silver, copper and lead have been discovered in America are here awaiting capital.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,
Sole Manufacturers,
227 First Street, San Francisco, Cal.

H.H.H. HORSE LINIMENT.
THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

HEALD'S

BUSINESS COLLEGE,
24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

SENSE FOR CIRCULAR. E. P. HEALD, President.
C. S. HALEY, Secretary.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history, and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurlys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

THE RAND DRILL COMPANY, 23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

ROCK DRILLS
AIR COMPRESSORS & GENERAL MACHINERY FOR MINING, TUNNELING, QUARRY & RAILROAD WORK.
RAND DRILL CO 23 PARK PLACE NEW YORK

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintances with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

PUMPS.

The BUYERS' GUIDE is issued March and Sept., each year. It is an encyclopedia of useful information for all who purchase the luxuries or the necessities of life. We can clothe you and furnish you with all the necessary and unnecessary appliances to ride, walk, dance, sleep, eat, fish, hunt, work, go to church, or stay at home, in various sizes, styles and quantities. Just figure out what is required to do all these things COMFORTABLY, and you can make a fair estimate of the value of the BUYERS' GUIDE, which will be sent upon receipt of 10 cents to pay postage.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

San Bernardino County Mines.

Exchequer Mining District.

EDITORS PRESS:—As you received no answer to my communication in your edition of May 12th, I will now answer it myself.

The owners of the claim in question, in which the vein at 60 feet deep was apparently cut off by a perpendicular wall of porphyry, as illustrated so clearly in the cut on page 297, concluded to put in a few thousand dollars and go through the porphyry dyke which they supposed was as wide at the point 60 feet below the surface as it appeared to be on the surface, when, to their surprise, two shots broke through the porphyry and revealed to them a continuation of the vein in all its former size, and containing much better ore than where it was cut by the porphyry. The porphyry was only four feet thick, and the owners of this property called the Cashier mine had only a few feet farther to go, when the vein formation widened out to 16 feet from foot to hanging wall.

The key to the whole district has now been discovered, the incline A on diagram (May 12th) has been extended and sunk about 40 feet, and has cut through ore going as high as \$2000 per ton. The amount of the ore body or pay streak cannot be determined, owing to the immense size of the vein. The incline has been sunk on the hanging-wall 5½ and 4½ feet wide in ore.

The owners have just let a contract to Messrs. Batchelder & Janzen for 60 feet of a shaft or incline 5½x4½, cut through from the hanging-wall. Nothing is known about the footwall which was left ten feet under the shaft, but at the expiration of this contract they propose to make a crosscut to the footwall. As they are men of limited means, they could not afford to take out the entire 16 feet of the vein formation. Every one rejoices in their good fortune in having found the vein on the other side of the porphyry. Experts and experienced miners gave it as their opinion that the ledge had faulted, perhaps, several hundred feet.

The camp was discovered in 1883, and some hundred or two of claims were located, and several carloads of ore were shipped by chlorides. Great excitement prevailed and every one supposed they had made a big strike, and so it appeared from assays obtained, which ran up into the thousands, and returns from chlorides corresponded with assays. All at once they ran against porphyry dykes, or so they appeared to be, when really they were nothing but the shrinkage of the veins, having contracted and the space filled in with porphyry, as has been discovered in exploring the Cashier.

But one by one the chlorides and owners of the location became discouraged and abandoned their claims, which were located by Spawforth & Spencer, with the exception of one or two parties, whom they had bought out previous to commencing work. They are now the owners of some 40 claims, which prospect on the croppings remarkably rich, and should they be found on the other side of the porphyry as was the Cashier, they have a valuable lot of mining property, which ought to make them millionaires, which they truly deserve to be for the pluck and energy they have displayed, at a time when the district was condemned by every one, far and near; and they had given the district such a black eye, so to speak, that they could not induce any one to help them in what appeared to be a gigantic task, i. e., the solving of the porphyry dyke problem; and every one supposed they would never find the vein again, or if at all, at such depth as to cost more than it would be worth, when only two charges of giant powder, a cap or two, and a few feet of fuse, unlocked the mystery. Now they are going down nearly 100 feet, the vein getting better all the time. But development work is expensive, particularly as you go deeper. They are ambitious to see what the vein is at 400 or 500 feet. Several parties have been to see the strike, and the owners can well afford to share with one or two more partners bringing capital into the concern. They will then have enough, and if only one-quarter of the locations prove good, one-quarter's interest ought to give them a good bank account.

I will drop you a line once a week from here, which you can place under the head of "Mining Summary," as we have no paper here, or in this vicinity nearer than 100 miles. I will make the heading as follows, until your readers know us: "Exchequer Mining District, San Bernardino County."

The following notes explain the condition of affairs in the camp at present: The Cashier is looking well and sinking is progressing very favorably. Batchelder & Janzen have completed ten feet of their contract, and are in very high-grade ore, extending the full size of the shaft. Soft ore is coming in at the bottom of incline and sinking will proceed much more rapidly, which is greatly to the benefit of the contractors as well as owners. The ore is remarkably heavy, being heavily impregnated with iron and copper; the heavier the ore, the richer in gold and silver. Assays often give from 1 to 3½ ounces gold to the ton, besides the silver. I saw one head weighed when I was over to their camp (an average of one foot of ore) which kicked the beam at 508 ounces silver. I did not learn how much gold it contained. A singular feature of the Cashier is the porphyry walls coming in at distances of ten feet. The first extends from the surface down to the footwall; the second did not extend above the

hanging-wall, but formed an arch extending from the hanging down most probably to the footwall, which cannot at present be determined. But what is more important than anything else, the vein gets better after going through these porphyry walls. If they should be a characteristic feature of the mine, and the same rule hold good, a few more porphyry walls will make the owners a mine without going very deep.

The entire mineral belt which extends about three miles east and west and about the same distance north and south, is split up in an easterly and westerly direction with these porphyry dykes or veins, and wherever a vein cuts through them it seems to be highly fertilized. The strike of the Cashier is due east and west, dipping to the north at an angle of about 45 degrees. The entire width of the formation or network of veins is about 100 feet. The owners expect to find the ledge dipping almost vertical at the end of the 60-foot contract, when they look for the entire 16 foot vein to be filled with ore. Crosscutting will then be commenced to tap the other three parallel veins in the hill which resembles a blow-out of ore, and may result in their finding an immense chimney. The most experienced miners are very favorably impressed with an east and west vein dipping to the north; this being a granite formation with porphyry dykes, seems to warrant the belief that they will go down to a great depth.

In the Laurentian systems of the older rocks, viz., granites, the east and west veins have never been bottomed by engineering skill. It is supposed, when the minerals were in an elementary state, that the magnetic currents passing from the Antarctic to the Arctic, when they met a vein with an east and west strike dipping to the north, it acted like a dam on the water and the magnetic currents were deflected downward to unfathomable depths; and although they did not pay as well on the top, the deeper they went the richer they became. On the contrary, a vein dipping to the south is almost always richer on the surface, but becomes poorer as it goes down, the magnetic current being deflected to the surface, leaving it in a state of barrenness.

Two openings are being made on the Cashier at distances of 100 feet apart from which very rich ore is being taken and would seem to indicate that there must be an ore chimney of great size and wonderfully rich at some point between the three inclines. Ore has been picked up on both sides of the Cashier hill on the surface very rich. One piece assayed 740 ounces silver, another a houlder of 25 pounds went 421 ounces silver and one ounce gold; another, 299; another, 378 ounces silver and 2½ ounces gold, indications which gave courage and heart to them to put in their money after repeated attempts on their part to give away one-third of the property to any one to come in and lend them a helping hand, and share with them. Then, becoming discouraged in trying to give away a fortune to some one, they concluded to go it alone.

PROSPECTOR.

Angels, Calaveras County.

EDITORS PRESS:—"Angels is to day the best mining town in the State," that is the verdict of the best mining men and they are backing their opinion with the coin. Messrs. Hayward & Hobart realize the staying qualities of the mines and have invested largely at big figures. That they have "come to stay" is evidenced by their fitting up a residence, and if reports are true a large company store will soon follow. The McCreight mine, on a basis of \$100,000, was their latest purchase. This mine lies south of Angels in Albany Flat. The ores in the last half month run by the former owners averaged \$165 a ton in free gold, with a 15-foot vein to mine from. An English syndicate has purchased of Mr. Stevenot of Carson Hill the group of mines extending from Albany Flat to the Stanislaus river, and will soon go to work on them. This group is probably the largest stretch of mining property in the State all on the mother lode.

In Angels proper the quartz-mills and hoisting works of the numerous mines greet the eye in every direction. With a depth of over 400 feet and an average of 25 feet in width on the veins, the owners feel more than secure in their possessions. Calaveras Co. offers every inducement to mining capitalists—good mines, cheap labor, water for milling, an abundance of timber, cheap transportation, and a climate that permits the working of the mines every day in the year.

At Murphys the Moss and Stone mines have passed into possession of the Oro Plata Co., and hoisting works are now being erected. This is one of the most promising group of mines in the county, and cannot but prove a bonanza to the fortunate purchasers. Conliffe & Driver are sinking on their 16 foot ledge, and when down 150 feet will crosscut. Sublette & Cutting are getting their pocket mine into shape for working. Heinsdorff & Dussell are putting in a Barantini ore-crusher on their 18-foot ledge. McQuage Bros. have shown up an eight-foot ledge on the White Pine, and the mine is reported sold. At Vallecito work is being pushed on the hoisting and pumping works of the Mitchell gravel mines. Go where you will and a new life has been infused into the mining industries of this section, and the future holds forth every promise of prosperity.

E. H. SCHAEFFLE.

Murphys, Calaveras Co.

An Improved Hydraulic Step.

Prof. Frederick G. Hesse of the University of California has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency an improved hydraulic step-bearing for shafts. The invention consists essentially in a chambered vessel containing water and encircling the foot of the shaft, and a plate or disk on the shaft rotating freely within the vessel and operating to force the water which is above it centrifugally, whereby a pressure of water is created below it equal to the maximum pressure above. More particularly the invention consists in a vessel containing water and encircling the foot of the shaft, which is guided centrally therein, a disk or plate upon the shaft and within the vessel, said disk or plate having a diameter less than the interior of the diameter of the vessel, whereby an annular space is left between the rim and the inner surface of the vessel; radial blades or flanges formed within the base of the vessel and under the plate or disk, whereby a permanent water pressure is established through the agency of a forced vortex created by the rotation of the shaft and the flanged disk which it carries, which pressure, in acting against the disk on the shaft, is made to balance a portion or the whole of the load.

The object of the invention is to provide a hydraulic step for shafts by means of a permanent water-pressure created by the rotation of the shaft itself. This is not only applicable to shafts placed vertically, but also to shafts placed in other positions—for example, horizontally, as in the case of a propeller shaft, and wherein the shaft is subject to a thrust of any kind. The parts may be compounded by having one or more inter-communicating vessels in the vertical series, through all of which the shaft passes, and having a disk or plate operating in each vessel, whereby the pressure of the water to support the shaft may be increased.

Mining Share Market.

While stocks do not seem to advance any, the hullion product of the Comstock does. The mines up there are being vigorously worked, and are producing more than they have for years.

The fight for the control of Savage resulted in a victory for the old management, under President H. M. Levy, the Borland faction being defeated. The election for trustees resulted in the election of H. M. Levy, A. K. P. Harmon, E. B. Holmes, Archie Borland and Morris Hoeflich, Mr. Borland succeeding W. C. Watson. H. M. Levy was elected president, A. K. P. Harmon vice-president, and E. B. Holmes secretary, with R. P. Keating superintendent.

The yearly report of the secretary was as follows: Savage Mining Company—Receipts and disbursements for the year ending 16th of July, 1888: Disbursements—Cash indebtedness July 13, 1887, \$94,661.48; taxes, \$1874.48; materials, \$24,299.98; combination shaft, \$2677.78; books and stationery, \$386.89; office expense, \$3678.52; ores, \$14,747.70; timber and lumber, \$30,377.94; interest and exchange, \$4932.77; labor and salaries, \$138,315.12; insurance, \$1687.32; water and ice, \$4144.20; fuel, \$12,348; incidental expenses, \$4195.54; assaying, \$1871.52; surveying, \$275; legal expenses, \$4717.02; Suro tunnel royalty, \$14,952.25; reduction of ore, \$91,392; discount on silver, \$55,637.11; mint charges on fine bars, \$3944.04; express freight on fine bars, \$591.65; R. P. Keating, superintendent, \$18,597.57. Total disbursements, \$530,295.88.

Receipts—Bal. superintendents' account July 13, 1887, \$309.09; assessments, \$112,000; hullion, \$338,951.53; cash indebtedness, \$66,770.15; Suro Tunnel Company, \$4476.13; Virginia & Truckee Railroad Company, \$4788.98. Total receipts, \$530,295.88.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

NORTHWESTERN CONSOLIDATED M. Co., July 24. Location, Nevada. Capital stock, \$10,000,000. Directors—J. C. Corey, John N. Taylor, Frank A. Hseeey, Mrs. M. J. Church and John Hentchinson.

SIERRA WATER CO., July 24. Capital stock, \$2,000,000. Directors—H. Ward, F. E. Gladwin, Wm. Gruenhagen, F. W. McCondray and Joseph G. Kearney.

CALIFORNIA HYDRAULIC DREDGING CO., July 25. Capital stock, \$600,000. Directors—H. L. Coyer, M. D. Hyde, D. McNease, Chas. E. Wilson, E. S. Johnson, C. L. Haskell and Elbridge Denbrow.

MERCED ELECTRIC LIGHT CO., July 25. Capital stock, \$100,000. Directors—W. E. Dean, A. K. P. Harmon, Chas. E. Elliott, W. L. Dean and D. C. Bates.

THE De Long mine, Washington district, San Juan canyon, Nye county, Nev., has been sold to Salt Lake men for \$50,000, and it is anticipated that active operations will soon be commenced on it.

FORESTRY.—The State Board of Forestry is in session in this city as we go to press. An account of the transactions will appear next week.

News in Brief.

SEVEN counties of Southern California give a population of 280,000.

LUMBER is being taken to Calico, and rebuilding will be pushed as fast as possible.

THE large hotel and railroad eating-house at Lathrop was burned on Monday last.

THE reservoir of Sweetwater dam, San Diego county, is to be stocked with lake trout.

CLAUS SPRECKELS of this city has just sold 5000 barrels of sugar in the Chicago market.

NEARLY every paper in the State speaks of the numbers of camping parties in the mountains.

GOLDENSON, the murderer of little Mamie Kelly, has been sentenced to be hanged September 14th.

THE Truckee Republican says there are 600,000 young trout at the Tahoe hatchery ready for distribution.

THE Lick Observatory did some capital work in taking observations of the moon during the late total eclipse.

THE New Mexican office and about \$60,000 worth of property at Santa Fe were burned Saturday morning.

IN 1833 California produced only 5,070,000 pounds of dried fruit. In 1887 the yield was 26,605,000 pounds.

THE Humboldt Standard is in favor of raising the assessment on timber land in the county from \$10 to \$30 an acre.

THE United States patent rights for Edison's phonograph have been sold to J. H. Lippincott of New York for \$1,000,000.

COLUSA farmers hire boys with slingshots to drive away birds from their orchards. One boy killed 27 jaybirds in two hours.

IN Santa Rosa is a church built of lumber and made entirely from one tree, shingles and all, with 10,000 shingles in excess of the hill.

THE bark Ottago went ashore at Point Reyes during a fog, and is a total loss. The crew pulled in their boat and landed at Folsom street wharf late Saturday night.

THE waters of the north fork of the Feather river have been turned into Big Bend tunnel, and the company is getting ready for putting a large body of men to work on the river-bottom, left dry.

AT Placerville, William Voss, a resident of Diamond Springs township, El Dorado county, while driving a team, dropped one of the reins, and, reaching for it, he fell to the ground and broke his neck.

THE Kern County Californian says that Haggis & Tevis and Lux & Miller have arranged their difficulty about irrigation and have signed an agreement to stop litigation and to spend their money in improving their vast landed estates.

THERE will be great demand for carpenters and other mechanics in Suisun as soon as the debris is sufficiently cleared away to allow building to commence. The town will be rebuilt on the old site and not in Fairfield as was at first reported.

THE monster log raft, or rather log ship, that has just been completed for James D. Leary, was successfully launched into the Bay of Fundy, at Joggins, N. S., Monday. The ocean tug Morse towed it out into the bay, and will soon start to tow it to New York.

THE Commissioner of Internal Revenue has submitted a preliminary report of his bureau's operations for the year ending June 30th. The total collections were \$124,326,474, an increase of \$5,649,743 over the previous year. Nearly the whole of the increase was upon spirits and fermented liquors.

THE philanthropist who generously donated \$30,000 to six churches, a few days ago, five of which are in this city, and who was at the time reported to be ill and confined to his room, turns out to be A. Montgomery, now a resident of this city and a millionaire, but formerly a resident of Colusa.

THREE weeks ago Louis Genisio, the porter of a hotel in Santa Rosa, tried to dislodge a rat from its hiding-place under some boxes. The rat was in close quarters and inflicted a savage bite on Genisio's hand. Early last week inflammation set in, and the prospects are that Genisio will lose his right arm. HERETOFORE milletofts have been shipped from San Francisco to Fresno. The tales have been turned, however, and on Saturday 30 carloads of Fresno products were shipped to San Francisco. The first 25 were bran, middlings and other feed; the next four were wine, and the other car was loaded with watermelons.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Commonwealth, July 26, \$50,000; Confidence, 25, \$54,647; Hale and Norcross, 24, \$30,000; Bluebird, 18, \$15,000; Mt. Diablo, 25, \$18,978; Confidence, 23, \$18,078; Hale and Norcross, 21, \$11,000; Hanauer, 18, \$4200; Germania, 18, \$2033; Hanauer, 19, \$1900; 20, \$1700.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JULY 17, 1888.

386,421.—FILTHER—R. Arnold, Oakland, Cal.

386,421.—BOX-FASTENER—Jos. Davy, Oakland, Cal.

386,319.—BRACE AND BIT—Isaac Holliday, S. F.

386,349.—WHEEL GUARD FOR CARS—P. Portois, S. F.

386,267.—WEATHER STRIP—R. C. Redman, S. F.

386,275.—THRILL COUPLING—A. J. Spicer, Portland, Ogo.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daggett, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Platform Scales, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPIE & CHILDS, 123 California street, San Francisco.

R. B. VAN DUSEN, a prominent mining man in Utah, had his right hand crushed in the new Emma mill at Alto, necessitating amputation.

ELECTRIC DEVELOPMENT COMPANY.

Incandescent & Arc Electric Lights

Electric Motors, Dynamos, Trams, Elevators, Signals and all kinds of Electrical Systems for lighting and transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works,

Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

EDISON INCANDESCENT LIGHT.

The only complete and satisfactory incandescent system. Lights require no attention, and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Luggage; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 1/2 pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by Dewey & Co., Publishers, No. 252 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates. I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot-Cut hurred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

Orders solicited, subject to above conditions.
H. D. MORRIS.

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp
is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the ra-
pidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so
that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in
any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tap-
pets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a
mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE
LARGEST CAPACITY.

New Appliances for Working Gravel Deposits.

The Pacific Iron Works of this city have recently been constructing two machinery plants for working gravel, the operations of which will be watched with unusual interest. The first is for the Vallejo Company of Calaveras county, and consists of a combined pumping and hoisting rig, operated by the Pelton water-wheel.

The gravel, after being hoisted from the shaft, is admitted into a revolving cylinder, made of boiler iron, with projecting flanges on the inside, the cylinder being 36 inches diameter by 16 feet long, and provided with a heavy iron screen at the lower end for the purpose of separating and carrying off the boulders and heavy gravel. The revolving cylinder is intended to disintegrate the material sufficiently to allow of subsequent treatment by the ordinary method of sluicing.

The second plant referred to is for the Wheaton mine at Smartsville, Yuba county, and consists of a Gates crusher, Reliance batteries and Duncan concentrators, also driven by a Pelton wheel. The gravel in this instance not being very coarse, and the gold-bearing cement adhering to it so firmly, it is proposed to crush the entire mass and put it through the batteries the same as ordinary quartz. The gravel carries with it a considerable percentage of black sand, rich in free gold, which it is proposed to save by concentration.

The Gates crusher will put the material into the battery from three-eighths down to 20 mesh, and the batteries having discharges on four sides, it is expected will handle at least four tons to the stamp of material reduced to this fineness.

Good results are anticipated from both operations referred to, details of which we shall take occasion to give when the works are started up.

BRYAN ROLLER MILLS.—On Saturday last, at the Risdon Iron Works, a large Bryan patent roller quartz-mill was exhibited in operation, and attracted quite a number of persons interested in quartz-reducing appliances. This five-foot mill is the largest of this pattern which has been built; it has a capacity of 30 tons a day—hard rock. It was made for the Bogart mine, near Oroville, Butte county. Some few changes have been made in the operating parts since this mill was illustrated in the PRESS. In the smaller mills the rollers are driven from their peripheries by the iron tank or drum around which the actuating belt passes. In this case, however, the rollers are driven similar to the method employed in the Chili mill. There are three rollers used. Three mills of this pattern have been running successfully for the past two years on the San Dimas mines; one is running steadily at a mine on the James river, Va., and others are in use in this State.

A COMPANY has been formed in Pittsburg to open a tin mine in Mexico, near Durango. A tract of land has been purchased covering an area 10 miles square. An expert who assayed the ore says it will yield from 25 to 30 per cent of tin. The distributing point will be El Paso.

PRICE OF LUMBER.—The Pacific Pine Lumber Company of San Francisco has reduced its prices for lumber on an average of \$2.50 a thou-

sand feet, commencing with to-day. The reduction covers all lines of pine, fir and spruce lumber and timber, and is followed also by a

However that may be, the reduction is likely to continue for awhile, at least if what some of the proprietors of yards around the city think

CASHIER MINE, EXCHEQUER DISTRICT.

similar reduction in redwood, though the company claims not to be able to control the redwood market, nor is it on their printed list.

to be true. Very much less lumber is being shipped to the southern counties than was the case last year.

Exchequer Mining Camp.

We have recently had several articles concerning the geological formation of Exchequer district, San Bernardino county, in this State. Our correspondent there sends us the following with the accompanying sketch: Spawforth & Spencer are doing considerable work on the Cashier mine, and are taking out some very fine ore. The incline sunk four years ago to the depth of 60 feet on a vein of six feet in thickness was cut off completely by a wall of porphyry and not a pound of ore left in sight. Ten tons of ore sorted from the vein sold at Kingman for \$175 per ton. The opinion of all experienced miners was that the vein had faulted and it would require a large company with big capital to find the vein. The owners concluded from the surface indications that they had 25 feet of porphyry to cut through to find the other wall, as the cut of same published by you May 12th would indicate.

Two shots only were fired when they struck the original vein on the other side of an eight-foot wall of porphyry. This virtually unlocked the key to the district, as porphyry wall after porphyry wall has since cut the vein and enriched it at every intersection, and the vein has been steadily improving, until they have opened up the vein over 60 feet below, where the first porphyry wall cut off the vein at 60 feet. They think they have found the apex of a large ore chute at incline No. 3, which is 200 feet west of incline No. 1, at a depth of ten feet. They are taking out ore that averages \$175 per ton, with a vein about 15 inches solid ore, selected specimens of which will run into thousands.

They also have a four-inch vein which at five feet from the surface averages \$200 per ton. Spawforth and Spencer are to be congratulated on their good luck, and they deserve it. As they are men of limited means, there will be an opportunity for capitalists to get a good layout from them. The formation of the hill is different from anything ever discovered before. I send a diagram showing the strike of the veins east and west dipping to the north at an angle of 45°, intersected by porphyry walls at distances of 10 and 35 feet. Below these porphyry walls the vein is renewed with very high-grade ore, in one instance enriching it to the extent of 508 ounces of silver over 12 inches thick. The sketch shows a cross-section at incline No. 1; the shaded lines represent porphyry; V are the veins.

C. F. SAROENT, who has resided continuously at Kodiak, Alaska, for 21 years, says the natives often bring him specimens of rock which assay well in gold and silver. He is confident that as good mines will be found in that region as have been developed on Douglas island. As a rule, the prospects are not far from tide-water and the ore could be easily shipped.

PRESS-TANK.—The engraving on this page represents the press tank used in the mechanical treatment of the products in the Russell process. In the continued article on this process, now running in the PRESS, this, and other mechanical appliances which we shall illustrate, will be described in detail. The drawing is made to scale.

SAN DIEGO is to call for an election to issue bonds to the amount of \$2,000,000 to purchase the water works now owned by the San Diego & Coronado Water Co. and the Flume Co.

CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—EDS.

From the Comstock.

EDITORS PRESS:—The output of ore at the Hale and Norcross, Savage, and Confidence, and for June and July at the Con. California and Virginia, has been considerably curtailed on account of the hanging up of the stamps at the mills on the Carson river, necessitated by the low stage of the water and the entire suspension of the extraction of ore at the Yellow Jacket mine. The Hale and Norcross has the use of 20 stamps at the Nevada mill and may have the use of the 20 additional stamps that have lately been added to the 40 that have been in use since the mill first started up. This mill is at the Chollar mine and driven by water obtained from the "Virginia and Gold Hill Water Co." Twenty stamps at that mill are reducing Chollar and Potosi ore. The Gould and Curry ore is reduced at the Douglas mill in Lower Gold Hill and driven by steam. The California battery-mill of 80 stamps and the pan-mill are being made ready to reduce ore from the Con. California and Virginia, which will be begun on the first of August next, and will reduce 300 tons daily. The Boss process will be in use as heretofore at the pen-mill, and gave entire satisfaction. The battery and pan-mills will also be driven by water supplied by the water company. The Con. Cal. and Virginia Co. carried over \$156,000 to July account, so that they will be able to pay the usual dividend of 50 cents per share, aggregating \$108,000, and, of course, continue to pay the same dividend monthly for a long time to come. The Morgan mill at Empire, being driven by steam, will be kept running as usual on their ore.

There will be a mill erected at the Woodville shaft of the Justice mine, to reduce the ore already on the dump and what will be extracted in the future. There are now out from 1700 to 1800 tons of ore. The Alta mill (steam) is kept running on ore from the mine and reduces and concentrates 25 tons per day. The Overman is extracting ore, but can only occasionally secure milling facilities. The Thompson mill in Lower Gold Hill is running on ore from the Oest and Haywood mines at Silver City. The Excelsior and Atlanta mills (steam) are running on ore from the Occidental mine, which mine is not on the Comstock lode, but on the Brunswick lode lying to the east of the Comstock. There is some ore being reduced at the small water mills in Six-mile canyon, and will continue to be as long as the water is of sufficient quantity to run them. Although milling facilities are not adequate to reduce the amount of ore that could be extracted from the Comstock lode mines, yet the ore will be held in reserve until that want has been overcome, and in the meantime other bodies of ore are likely to be developed, as prospecting will be vigorously prosecuted in all of the mines whether producing now or not. The Crown Point, Belcher and Segregated Belcher will be in a condition to yield ore before milling facilities can be had.

The water in the Carson has fallen off much earlier this season than heretofore on account of the small amount of snow that fell in the Sierras last winter, and it is not likely that there will be sufficient supply again before October or November to enable the mills to be started up. The Confidence ore is reduced at the Brunswick mill, which is driven both by steam and water, but the water failing, only the number of stamps that can be kept dropping by steam-power will be run.

JAMES DELEVAN.

Virginia City, Nev., July 24th.

Placer County Mines.

EDITORS PRESS:—The mines and mills generally in and around Ophir and Newcastle are lying dormant, with the exception of two small custom mills in the Ophir, owned by W. H. Fidd, the Lawrence at Ophir and two Bryn rolling-mills at Newcastle.

The mills and mines are lying idle on the Julien, New Year, Gold Blossom, Three Stars, St. Patrike, Peleter, Hathaway, Green and others. Many of these are only temporarily closed, while a few will be permanently from various causes.

General inactivity seems to prevail throughout this county in mining operations. Although decidedly a mining county, yet the class of people who have of late years come in have turned their attention almost exclusively to agriculture and fruit-raising.

NEW LUMBER INCORPORATION.—The Northern California Land and Lumber Co. to deal in lumber, colonizing and cultivating lands, constructing water ditches, etc. The capital stock is \$1,000,000, divided into 20,000 shares. Directors—Frank Dalton, George M. McCarthy, George H. Foster, George McCord, David Bueh, George H. Mitchell and Thomas L. Potter.

A NEW MACHINE.—The new machine just invented for printing postal-cards prints them from the roll and turns them out in packages ready for delivery. It runs them off at the rate of 300 a minute, with paper bands pasted around each 25. It is said one man can look after two machines.

Mining in Nevada County.

Graes Valley.

EDITORS PRESS:—This beautiful little mountain town is without doubt one of the liveliest mining towns in the State, which is owing to the great activity in the development and steady working of the various mines in and around the town.

Many old mines that have been abandoned for years have been reopened and are now proving among the best in California, paying from the very starting up of work. This has given a stimulus to many to prospect, and has caused reopening of numerous old claims that were left years ago. Thus the future prosperity of the place is assured, success having been attained in almost every instance.

The general thrift of the place is fully attested by the very neat homes of the residents and the extreme taste and neatness of attire of the younger members of the community, all of whom present an appearance that might be envied by many larger places much more favored by locality and advantages.

Much prospecting is being done all around Graes Valley and shafts are being sunk in every direction, the windlass being the hoisting power. Most all the ledges lie very flat, being generally at an angle of 35 degrees or thereabouts in the largest and deepest of the mines. This enables them to hoist by car in many cases instead of using buckets or cages.

Most of the hoisting works are run by water-power, this region having the most abundant supply in the State, lasting the entire year through.

The W. Y. O. D. Company.

This mining company is entirely composed of young men of Grass Valley, the oldest of whom is not 30 years of age. They do all their own work. Thus the significance of the initials which designate the name, "Work Your Own Diggings Co." These young men struggled along for years in opening up the ground, till now they are down about 300 feet taking out rock that will mill in free gold about \$18 per ton. Parties have recently tried to bond the mine for the sum of \$75,000, but they now say "no, no bond to any one—cash only will take it." At first they were refused credit and had to scratch hard to live; and had not the banking firm in Grass Valley stepped in and assisted them they would not now be in the prosperous condition that is warranted by the outlook.

They are now crushing ore in a mill hired by them for the occasion.

The Empire Company and Ophir Mill.

This company is in the very height of its prosperity. Everything in and about the mine and mill is running smoothly. The ore is of excellent grade and the mill comparatively new, with all the latest improvements. Prospects ahead are sufficiently bright to justify them in thinking of erecting additional works in the near future. This property is under the management of quite a young man, Mr. Geo. W. Starr, who should be proud of so distinguished a position on such a magnificent property.

The Smith Claim.

This company is now down about 700 feet, taking out ore and crushing in the mill, which is one of the oldest and most primitive in construction. The amalgamation is chiefly done by means of the old style—Atwood concentrators. The sulphurets are all blanketed and then are ground in pans by mallets. The vein matter is quite small, but pays from \$18 to \$50 per ton.

The Omaha Mine.

Near Allison Ranch, is running in full operation, employing about 40 regular hands, besides numerous tributaries in the old parts of the works. The mill is one of the old style, and most probably will be long replaced by a new one, that being the intention at present. The ledge, like all others throughout the section of Grass Valley and Nevada City, is small, but efficiently rich to fully make up. The grade of ores generally hereabouts runs from \$15 up to \$80 per ton, free milling, without counting the sulphurets.

The North Star Mine and Mill.

This company can well afford to rest on their laurels, having one of the very richest of mines. Specimens of ore in the superintendent's office show gold very freely, and the company has it in quantity in the mine. As to the mill, it is simply perfection, being automatic from the time it receives the ore until the amalgam is turned out.

Nevada City.

This once most flourishing town, I am sorry to see has apparently gone into a decline that seems to have paralyzed every industry in it. This has been caused, first, by the stoppage of hydraulic mining, and later on, by the cessation of most of the quartz mining.

Hereafter to be found some of the most elegant little homes in the State, all of which seem destined to become desolated and forsaken unless some method can be devised, or some modification of the debris question arrived at in the near future. Trade of every kind is stagnated. The farming interests, although flourishing as to products, cannot live unless fostered by the mining interests up here, on account of the lack of money and distance from markets. The quartz mining, with but few exceptions immediately around the town, has ceased to be remunerative at depth, the formation being in granite, and the ledge, all small at the best, have pinched out, so that at the present the outlook is truly to be regretted. W. A. K.

The Niehart District, Montana.

[From our Correspondent, R. G. HUSTON.]

EDITORS PRESS:—This district is one of the most promising in Montana to-day, as it is well established that good mines are here. The Hudson Mining Co. put up a smelter some years ago, but found by a practical test that their ore did not carry lead enough to make it a good smelting proposition alone. The Montana Central are about to extend the branch they built to connect with the Sand Conlee coal mines into the Niehart district, as they will soon have a portion of their large works at Great Falls ready to operate. On the group of mines in Niehart, owned by Hill & Chamberlain—the Montana Belle, St. Julian, Minnehaha, Maud S. and Dickens—they have two shafts 90 feet in depth and two tunnels; one of these is 75 feet, and another 150 feet in length, showing a three-foot ore body in all of the developments, carrying black sulphurets to the value of 100 to 125 ounces in silver per ton.

J. L. Niehart & Co. own a group of mines as follows: Homestake, Queen of the Hills and O'Brien. On the O'Brien they have a shaft down 60 feet; on the Queen of the Hills there is a tunnel 125 feet; and on the Homestake there is a tunnel 520 feet, where there is a six-foot vein carrying some lead and about 75 ounces silver.

The Florence, owned by A. M. Henry and R. G. Wight and G. L. Johnson, is developed by two tunnels; one 125 feet, the other 140 feet on the vein. The five-foot ore body carries brittle and native silver in abundance. The vein can be easily sorted to 150 ounces. Some very elegant specimens are on exhibition in Helena from this mine.

The Snowdrit, owned by Spencer, Mayne & Heitman, is another fine prospect. Tunnels have been run for some distance on this mine, but the ore body has not been crosscut at right angles. In consequence it is hard to say with any accuracy how much width of ore they have.

The Dakota, owned by Warren Toole and others, is developed by a tunnel 225 feet long. They have a nine-foot ore body and claim an average of 40 ounces assay value.

The Galt, owned by Messrs. Toole, Macin and Leder, is developed by a shaft 90 feet deep, and the ore in the bottom of the shaft samples 90 ounces in silver.

The Niehart district has mines of great merit within its limits without a doubt. Like many other regions in Montana points, it has been held down by the position as regards transportation. The Cooke City mines give another example of this kind. No railroad communication for low-grade mines means no work.

The Old Placer Mines.

In Confederate gulch, are with few exceptions played out. At Jas. King's badrock flume they have during the present season piped off 400 feet of the rim of the Montana Bar, where those immense fortunes were made during the early days of the camp. At one place in particular two men did not have credit for a sack of flour on Christmas, and the next September they left the camp with a four-mule team loaded with gold dust. Such windfalls as this are scarce, yet Messrs. Jas. King & Co. will no doubt make a handsome cleanup for this season, as they are in the best of their ground.

They were jnet pining down to quit, as their flush water season was about over. The other badrock flume was compelled to suspend operations, as King's tailings were coming down too thick for them.

The Water-Power at Folsom.

The chief engineer of the Folsom Water-Power Co. says that when the dam and canal in process of construction at the penitentiary at Folsom are completed the State will receive property rights worth \$500,000.

The prison will have 500-horse power from the dam, which would cost \$50,000 a year to operate were machinery put in place thereof.

There are at present 240 convicts working in the construction of the dam in the American river. It is to be built of granite, and will be 45 feet wide at the base, 25 feet wide at the top, 63 feet wide in the bedrock, and will have an overflow at freshet time of 20 feet. The total length of the structure will be 600 feet.

But there is urgent need for more men on the work, and 150 would not be too many. If this number could be obtained the canal would be completed in two years, but under the present circumstances the time will extend about six months beyond that date.

Figuring on a possible freshet in 80 days, although one may not come for 120 days, 120,000 cubic feet of granite in all would have to be laid, or 1500 cubic feet a day, in order to have the dam built up high enough to prevent a flood from destroying the foundation.

So anxious is the Folsom Water-Power Co. to secure additional labor in building the dam, that it has offered to take 100 or 150 extra convicts on account of what is known as the Livermore contract, wherein the State, several years ago, bound itself to furnish the company all the help required in building the dam, in return for certain concessions, and pay for these convicts at the rate of 50 cents a day during the low-water season. It is possible the desired arrangement may be made, although convicts are scarce in the market just now and bring a good price.

The Hidden Treasure Mine Fire.

In the PRESS of last week was a brief account of the fire at the Hidden Treasure mine, Placer county, where two miners lost their lives and a number of others had very narrow escapes. Concerning this fire the Auburn *Republican* says:

The care which brings the gravel out of the Hidden Treasure mine at Sunny South are hauled back into the long tunnel by a horse. About 1 o'clock last Friday afternoon as the animal was drawing a train of empty cars into the mine, he proceeded only a few hundred yards, when he stopped, and sniffing the air refused to proceed. It was with the greatest difficulty that his driver urged him forward as far as the blacksmith shop, which is in the tunnel about 5700 feet from the entrance. Before he reached the forge the driver discovered that something was wrong with the air, and he told the blacksmith, Forrest Brown, that something must be on fire. About 75 feet below the forge—that is, toward the mouth of the tunnel—is a shaft which leads up into the air drift above. Mr. Brown hastened to this shaft, and when he ascended he found the timbers in the air tunnel on fire and could hear the loud roaring of the flames. The fire was undoubtedly caused by sparks which had gone through the flue leading from the forge to the air tunnel to conduct away the gas. The fire shut off the current and the mine immediately began to fill with gas and foul air. Mr. Brown quickly gave the alarm to the miners. There were about 70 men in the mine, only 15 of whom were above the forge. Eight of these 15 and all the others who were below the forge escaped from the tunnel without much difficulty, although many of them were greatly exhausted before they reached the open air. One of them, John Bowring, better known since 1850 among miners as "Yank," unconcernedly started to walk out of the tunnel, but he fell on the way and died almost as soon as his companions carried him outside.

There were now seven men remaining in the mine above or beyond the blacksmith shop—six Chinese and a white man named William Rogers. Several men at once volunteered to go to their rescue, and the party consisted of Supt. Harold Power, Winfield Davies, John Kelley, J. B. Thomas, Robert McKatchnie, Charles Halstead and a Chinaman. As they proceeded into the tunnel, one by one they were overpowered and fell unconscious. Power, Davies and Kelley managed to reach a point within 60 feet of where they knew the miners were, but they could not see them and were unable to give an alarm before they themselves fell exhausted.

There was now a large number of excited men and women at the entrance to the tunnel, and as the first rescuing party did not return, others were formed and ventured in to save, if possible, those who were already in the mine. None, however, were successful, and nearly every man was overpowered by the foul air before he had proceeded far underground. At one time during the afternoon there were 30 men lying on the dump—all exhausted, and some of them unconscious after their efforts to penetrate the deadly air in the tunnel. The women worked hard in reviving the men, and had it not been for their efforts it is probable that several of the men would have died.

At last a party of three, Patrick and Thomas Halligan and Charles Middleton, entered the mine. This was Patrick Halligan's third trip, but the three succeeded in forcing their way to a point 60 feet above the forge. There they found the dead body of Robert McKatchnie. He had fallen with his face in the ditch at the side of the track and had been drowned. He leaves a wife and four children in Michigan Bluff. The three men were unable to proceed any further, and returned to the eager people outside with the report that those in the mine must have perished.

During the three or four hours when what has been related occurred, most of the first rescuing party were lying unconscious where they had been overcome. It seems, however, that the foul air confined itself to the main tunnel and did not penetrate the gangways where Rogers and the six Chinese were at work. At last Rogers took some loaded cars down to the main track and then discovered the condition of the air. Believing that there was a fire somewhere, he ran back for the Chinese and they quickly made up a train of empty cars and hastened to escape from their peril. They found Power and his party on the way and carried them into a gangway, where they regained consciousness. The Chinese then pushed out the cars carrying Harold Power, W. Davies, John Kelley and four Chinese. On the way they picked up J. B. Thomas, who was lying insensible across the track. The joy of the anxious throng who waited, expecting that these men were dead, knew no bounds when they found that they were safe.

It was after 5 o'clock when the last man emerged from the tunnel. The fire in the upper drift gradually died out, and a thorough examination shows that the actual damage to the property is only nominal, as the timbers were burned for a distance of only 70 feet, and the loss will not exceed \$200 or \$300 at the most. But if the loss of time be counted, the accident has cost the owners a much larger sum. Repairs have been made, and work was resumed in the mine on Monday morning.

A STEEL CAR WHEEL is expected to run 50,000 miles, but very few of them ever make that distance.

The Russell Process.

Its Practical Application and Economic Results.

(Continued from our last.)

Tables VII, VIII, IX, X, XI, XII, XIII, XXVI, XXVII, XXVIII and XXXI illustrate the changes taking place during roasting, and the effect of various sizes of crushing and percentages of salt on the results of the furnace work, as shown by assay-office leaching tests. Tables VII and VIII referring to the Stetefeldt furnace, IX to the Howell, X and XI to the reverberatory, and XII, XIII and XXVIII to the Bruckner, while tables XXVI and XXXI sum up and compare the furnace work by all the furnaces.

TABLE VII.

RESULTS OF ASSAY-OFFICE LEACHING TESTS, ONTARIO ORE ROASTED IN A STETEFELDT FURNACE.

Conditions Under which the Mill Tests Were Made.	By which Process Treated In Assay Office.	Per cent Extracted after 5 Hours in Furnace.	Per cent Extracted after 15 Hours in Furnace.	Per cent Extracted after 25 Hours in Furnace.
16 Screen—8 per cent Salt added between Battery and Furnace.	Russell P. Ordinary.	81.6	80.4	64.3
30 Screen—7.5 per cent Salt added between Battery and Furnace.	Russell P. Ordinary.	80.4	81.4	64.3
16 Screen—12 per cent Salt added between Battery and Furnace.	Russell P. Ordinary.	80.4	81.4	64.3
20 Screen—12 per cent Salt added between Battery and Furnace.	Russell P. Ordinary.	80.4	81.4	64.3

In regard to the size of crushing, Table VII shows that with 12 per cent salt, a 16 and a 20 mesh screen on Ontario give about the same results. These results are probably as high as could have been given by a 30-mesh. The results are given more in detail in Table VIII.

TABLE VIII.

CHANGES TAKING PLACE DURING ROASTING. RESULTS OF ASSAY-OFFICE LEACHING TESTS, ONTARIO ORE ROASTED IN A STETEFELDT FURNACE.

8	8	9	9	8	8	8	8	8	8
9	9	10	10	9	9	9	9	9	9

For San Antonio ore, in a Howell furnace (Table XXVII) the change from 26 to 12 mesh produces no effect, while the San Miguel results are depressed 2.8 per cent by the same change. It should be stated that, while roasting San Antonio ore, some San Bartolo ore was always present.

Sombrerete ore (Table XXVII) in a reverberatory yields 2.7 per cent more with an 8-mesh screen than with a 30-mesh.

Table XII apparently indicates that a 10-mesh screen gives better results than a 26-mesh on Yedras ore, with a Bruckner furnace. That such is not the case is shown by the vault sample (Table XXVIII) for the same charge, which shows only 67.5 per cent extraction, or 16.6 per cent less than the furnace sample. The "vault" referred to is the chamber into which the roasted ore falls as it comes out of the furnace. The results on another charge also (Table XIII) show that the Bruckner furnace results are 4.5 per cent less with a 10-mesh screen than with a 26-mesh.

Table IV shows the effect of coarse and fine crushing on the leaching results in the mill. For Ontario and Sombrerete, the relation between the assay office and mill results remains the same whether a coarse or fine screen be used, and, for Ontario ore, whether the ore was from the shaft or the dust-chambers. But in the case of San Antonio the discrepancy between the mill and the assay-office results was increased 5.7 per cent by a change in crushing from a 26 to a 12 mesh screen, and in the case

of San Miguel ore, the same change caused an increase in the discrepancy of 3.6 per cent. As a rule, however, a 16 mesh screen gives as good results as a 30-mesh, and the leaching results in the mill will average within one per cent of the result in the assay office. Both the apparent exceptions given may be due to defects in the roasting. At Lake Valley, owing to the imperfection of the screening apparatus, much ore had to be leached which would not pass a 10-mesh screen. But it was found that the material which would not pass such a screen was chloridized just as high and yielded as high a percentage in both assay office and mill as that portion which would pass a 40-mesh. In the case of the Bremen tailings, as long as the leaching rate remained at about one half inch or more per hour, the difference between the mill and the assay-office extraction was only one-tenth to one-half ounce per ton.

b. Effect of Various Percentages of Salt on the Roasting.—In regard to the percentage of salt for Ontario ore and a Stetefeldt furnace, Table VII shows that either with a 16 or a 20 mesh screen 12 per cent of salt gives the best results. The tables do not show the comparison of results caused by different percentages of salt with a Howell furnace, but at Cusi the extraction in the assay office was not usually appreciably altered by any percentage of salt above 12 per cent, although as high as 16 per cent was tried. The Howell furnace used at Cusi were of cast iron, 23 to 27 feet long and 60 inches in diameter at the lower end; the lower end, for 6 to 8 feet, being lined with brick and the remainder of the furnace being either with or without shelves, and with or without one or two brick rings to retard the ore. Tables XII and XIII show the effect of various percentages of salt on the results of the furnace samples for Yedras or roasted in a Bruckner furnace. But in this case, also, Table XXVII shows a decrease of 7 per cent in extraction from the vault sample, as compared with the furnace sample.

As to the results of an oxidizing roast, the first two columns of Table VIII show the effect of such a roast in a Stetefeldt furnace on the results of assay-office leaching-tests for Ontario ore. Table XII gives the corresponding mill-results. The first section of Table XIII shows the effect of an oxidizing roast in a Bruckner furnace on Yedras ore. The second section gives the results obtained from the same charge 15 minutes to 1 hour after the addition of salt, and section 3, the final furnace-results. The results from the corresponding vault-sample would probably be 7 per cent less. The comparative applicability of the various furnaces in the preparation of ore for the Russell process will be considered later.

the effect of an oxidizing roast in a Bruckner furnace on Yedras ore. The second section gives the results obtained from the same charge 15 minutes to 1 hour after the addition of salt, and section 3, the final furnace-results. The results from the corresponding vault-sample would probably be 7 per cent less. The comparative applicability of the various furnaces in the preparation of ore for the Russell process will be considered later.

4	" " " "	61.0	51.7	70.4	22.5

c. Effect on the Leaching of Wetting Down Roasted Ore while Red Hot.—The effect of wetting down roasted ore on the cooling floor while red-hot may be very injurious, as shown in the following statements, the first furnished by Mr. Frank Johnson:

SAN BARTOLO ORE, CUSI, MEXICO.

Value of Ore. of	Extraction		
	by Ordinary in Assay Office.	by Extra Solution in Assay Office.	
Oz. per Ton.	Per cent.	Per cent	
Before wetting down...	49.1	69.1	86.3
After wetting down ...	49.1	20.3	80.3

SIERRA GRANDE ORE, LAKE VALLEY, NEW MEXICO.

	Extraction		
	Value of Ore.	by Ordinary in Assay Office.	by Extra in Assay Office.
	Oz. per Ton.	Per cent	Per cent
Before wetting down...	16.0	81.5	87.5
After wetting down...	16.0	62.5	71.9

The above decrease in extraction by both the ordinary and extra solution is probably due to the reduction of some of the silver compounds to the metallic state by the steam formed by the red hot ore and water. No decrease oc-

cure unless the ore is red hot when wet down. Although the above tables give only the assay-office results, the effect on the mill results was approximately the same. Of the above ores, the first was acid, the second alkaline, and both were roasted in Howell furnaces.

The following statement shows the effect on the Sombrerete mill results of wetting down that ore while red hot, the ore being acid and roasted in a reverberatory and leached in charges of 4½ tons each:

Value of Ore.	by Ord. in Assay Office.	by Extra in Assay Office.	by Extra in Mill.
Oz. per Ton.	Per cent.	Per cent.	Per cent.
Average mill results on ore wet down while red hot.....	35.5	77.5	84.0
Average mill results on ore not wet down while red hot.....	36.5	74.0	80.3

In the above statement only the difference between the extra in the mill and that in the assay office should be noted. The other difference are probably not due to the wetting down.

That wetting down while red hot is not injurious on all ores is indicated by the following statement, although it refers only to assay office results. The ore is "alkaline arsenical," and was roasted in reverberatory furnaces. The difference in value may be due to a change in the lime compounds.

YEDRAS ORE, BINALOA, MEXICO.			
	Value in Ounces.	Extraction	
		by Ord- inary in Assay Office.	by Extra in Assay Office.
		Per cent.	Per cent.

d. Weighing and Charging the Ore into the Leaching Tanks.—For the success of the whole plant, as well as of the various leaching operations, the weight of ore charged into the leaching tanks must be accurately known. Otherwise, the cause of losses and discrepancies are not likely to be discovered. By weighing the ore into the leaching tanks, it is known at once whether the losses occur during the preparation of the ore for leaching or during the actual extraction of the silver and treatment of the product. For instance, at Cusi, in 1887, a loss of about 14 per cent was caused principally by dust, but, perhaps, partly by volatilization of the silver in roasting. That this loss occurred in the preparation of the ore, and not in the leaching, could not have been determined without weighing the ore between these two operations. On the other hand, if the weight of ore charged to the leaching tanks is determined by a merely approximate method, as by weighing only one cubic foot of a charge, much time and labor may be expended in searching for the cause of an apparent discrepancy, three-fourths of which may not exist. Aside from the question of the extent of the inaccuracy of this method, the fact that it is at all inaccurate is demoralizing, and discourages the making of comparative experiments on all subsequent operations. It is not exaggerating the importance of this point to say that upon the care used in weighing the ore charged to the leaching tanks often depends the success or failure of the whole plant.

The manner of charging now requires attention. As the proposed method of "trough-livification" does not do away with leaching tanks, but is merely a method of charging the ore into the tanks, a treatment of that subject will not be out of place here. In this method the ore is dumped into a trough (or first into an agitator) together with water or solution. The trough conducts the material to the leaching tanks. The result of using this method is a separating in the tank of the coarse and fine particles—the coarse particles sinking to the bottom, while a hard layer of impenetrable slime forms on the top, if one tank is used, and the order is merely reversed if various tanks are connected. When raw ore and tailings are thus treated, no amount of vacuum (up to even 20 inches of mercury) will cause a downward leaching; and if pressure below the ore is used, the liquid simply breaks a hole through the charge at the side of the tank. If water has been used in the trough or agitator, as would be necessary in the treatment of roasted ore, it is almost impossible to introduce the solution into the ore. If solution is used first, as for raw ore, this silver-bearing solution cannot be removed. It is true that, after the supernatant solution has been allowed to settle for a long time on the surface of the charge, that part of the solution can be decanted off, but this represents only a portion of the silver-bearing solution.

(To be Continued.)

ADELAIDE COPPER WORKS.—A. S. Bates, one of the owners of the Adelaide copper works near Golconda, Nev., says they have been delayed in getting iron ore for flux, but they hope to start up the furnace immediately and make a successful run, as they have plenty of ore at the furnace.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ZEILE.—*Ledger*, July 28: At this mine they have cleaned out the sump preparatory to sinking. We believe it is the intention to sink 200 feet, and the work will be pushed to completion with all possible speed.

MISCELLANEOUS.—The cleanup of the Kennedy mine last month reached \$15,000, the best cleanup with one exception, since the present company took charge. The ore comes from the 750-foot level, which is turning out exceedingly well. A movement is being made to incorporate the Doyle mine, in Hunt's gulch. The papers will be made out the coming week. The development of a paying mine in that locality will be fraught with good for Jackson, and the prospects are favorable for the opening up of a solid mine by the expenditure of a few thousand dollars. The Huntington roller-mill at the Valparaiso, near Middle Bar, is running at intervals. It is found, however, that the ordinary mill process is not adapted to the rich rebellious ores of that district and a large percentage of the gold is lost no matter how carefully treated. The owners, Ginocchio Bros., are talking of putting up a small oven to roast the ore before crushing it. The mine is looking well.

SUTTER CREEK.—*Cor. Amador Ledger*, July 28: Sinking at the Wildman is progressing at an encouraging rate. Considerable quartz, said to be of a paying character, has been encountered. Sinking at the North Star is progressing satisfactorily. I believe the shaft is now down a distance of 575 feet. When a depth of 600 feet has been attained, cross-cutting will be in order.

Calaveras.

AROUND SAN ANDREAS.—*Calaveras Prospect*, July 28: The Union mine, about three miles out of town near the Angels road, is now being worked quite actively, and is under the management of Mr. Ricketts. Like most of the mines in this locality, the ore is of low grade, but with the good and ample milling facilities that it is provided with, it will undoubtedly pay its owners a fair margin over expenses. Twenty stamps are now being kept in active operation. The Thorn mine near this place, under the able management of P. S. Buckminster, is looking exceedingly well. Rich rock has been struck, giving great encouragement to its owners. About 15 men are employed, working night and day. The engine to aid in the further development of the mine is being placed in position. One by one the mines around San Andreas are opening, and each one gives greater encouragement for a mining boom in the near future. It is only a matter of time till the mining belt in our midst will be dotted with hoisting works and quartz-mills. Things have not looked so bright and encouraging as they do at present in many years. Improvements can be seen on all sides of us. Capital is slowly but surely leading toward us. A rich strike was made Tuesday in the Reed and Leonard quartz mine. After sinking about two weeks a rich body of ore five feet in width was struck about ten feet from the surface, the rich, pure gold showing itself all through the lead. The owners are highly elated over this rich discovery. Hoisting works will soon be erected and an engine put up. D. B. Reed of Table Mountain is one of the owners, and he is now superintending development. The Quaker Hill mine, near Chili junction, is being worked steadily under the superintendency of Mr. Ed Rigney. A force of men is putting the Mitchell mine in Vallecito in readiness for operations on an extensive scale. Some machinery was also brought upon the premises.

WEST POINT.—*Tuolumne Independent*, July 28: Quite a number of miners have arrived in Sonora during the last two weeks, from Calaveras. They hail from West Point, and report that town, which two years ago had a boom and was considered the pride of the county, as having gone down to nothing. Some ten mines used to be in operation day and night, while now none are working but the Lockwood, with a force of about 20 men; a year ago the same mine worked 150. Deserted mills are to be seen on every hand, their rusting machinery standing as monuments of a glorious past.

Nevada.

IDLE MINES.—*Herald*, July 28: Instances keep multiplying which show that gold-bearing ledges do not give out, entirely, either in quantity or quality. There are poor streaks in most ledges, but when further developments are made the original quality and quantity come in again. The North Star, the Empire, the Yuba, the Rainbow, the Providence, the Omaha and others, are instances sufficient to prove the rule. This rule holds good, at least in Nevada county. There are, in this immediate mining district, a half-dozen mines that have paid well in the past, but when a poor streak was encountered work was stopped and the mines allowed to stand idle. There is no sort of question but what these same properties, if thoroughly explored and sunk deeper upon, would again become productive. The trouble with nearly every one of such mines in this district has been that when they paid well the owners became extravagant and laid by none of the profits to cover emergencies. When the shoots pinched out they had no money to go ahead—became discouraged and shut down. There are half a dozen such mines within two miles of this city. They will be opened again some time, and the ones who open them will make money on the investment.

AN ORE BODY FOUND.—*Tidings*, July 26: A 12-foot body of ledge matter—talc and quartz stringers—has been uncovered at the New Eureka mine, in a crosscut 35 feet from the 300-foot level, in the foot-wall. This ledge, if it may so be termed, is identical with that in the Crown Point mine, adjoining on the southeast, is in picking ground and between smooth walls—greenstone slate on the south and serpentine on the north. The quartz and talc are highly mineralized. At this writing, however, the find has not been prospected. As the machinery on the mine is too light to meet the requirements of hoisting and pumping, the New Eureka will, in a short time, be shut down and a heavier plant erected. Then the shaft will be sunk an additional 100 or 200 feet and drifts and stopes opened. At this depth it

is believed the ledge matter above will be found as a solid quartz vein. Messrs. Weldman, Walrath and Skinner, the owners of the property, have expended a large sum in accomplishing what has been done. Should the New Eureka venture prove successful, these gentlemen have arranged for working the vein on a more extensive scale than this district has yet known.

BALTIC.—*Baltic mine*, Washington township, reported to have "struck it rich," having two feet of ore on the footwall that will mill from \$20 to \$25 a ton. The ledge is six feet thick.

GOOD PROSPECT.—*Tidings*, July 26: A ledge—size yet unknown—has been found in the west drift of the 300-foot level of the Brunswick mine. This will immediately be crosscutted upon. It was struck at a point 55 feet from the old shaft and the ore is the best appearing yet found by the new company, carrying sulphurets in quantity and of good quality, also other minerals. The value of the find will be demonstrated by the crosscut. Twelve men are employed at the Brunswick, and although the shaft has not been deepened, prospecting work has been actively pushed for months.

SALE OF THE EAGLE BIRD.—*Herald*, July 28: The Eagle Bird mine at Maybent has changed hands and will now be extensively worked. O. Newhouse will be the manager. His family went up to the mine to-day. The starting up of the Eagle Bird will be a good thing for the upper country and for the county.

Placer.

HIDDEN TREASURE MINE.—*Herald*, July 28: The Hidden Treasure mine is not an old mine, gravel having been struck in April, 1876. The mine, partly through good management and partly through the richness of the gravel, has paid well ever since. As the distance into the hill increases, the expense increases. The gravel is a white quartz, and its whiteness gives it a clean, bright appearance as one looks at it in the breasts. The deposit extends in nearly a northerly and southerly direction; its inclination is about seven feet to the mile. At present all the work is done on the eastern side. Gangways are run from the tunnel in that direction, and from them breasts are worked north and south. This is a continuation of the Amador slate, which here forms a belt six miles in width. The tunnel is timbered with the exception of 1000 feet, where it passes through hard cemented gravel. In some parts it is wide enough for two tracks, while in others the width is hardly sufficient for one track. This is caused by the nature of the rock, which swells with such force that strong timbers are broken. The direction of the pressure is upward. The swelling of the rock necessitates continual repairs. At one time 2300 feet of tunnel was retimbered. At present two shifts numbering 23 men are constantly at work putting in new timbers. This is deadwork and is a heavy item of expense. The track is of T rails weighing ten pounds to the running foot. The cars are drawn in by horses and hold a ton each of gravel. The usual output for 24 hours is 375 carloads. At this writing 45 white men and 105 celestials are employed. The whites receive from \$3 to \$3.25, according to the nature of the work, and the celestials are paid \$1.50. H. T. Powers has succeeded his father as superintendent and the shareholders and employees are well satisfied with his management. The gravel is paying very well at present. The system of ventilation is practical and keeps the mine supplied with good air. Parties entering the mine the day after the fire was extinguished found the air pure and wholesome, and men were put to work the evening of that day. The gravel is washed at the mouth of the tunnel, and a long run of sluices extending down the canyon prevents the loss of any appreciable amount of gold.

Plumas.

GRANITE BASIN.—*National*, July 28: Mr. Joseph Peppin informs us that the outlook for quartz mining in Granite Basin is better than ever before. Chatty & Co. are working very rich rock and are putting up a five-stamp mill, the machinery being on the ground. See & Jolly are working good pay-rock and will make a profitable summer's work. A lower country firm is putting in machinery to work the tailings from the different mines, and claim that they can be worked profitably. Granite Basin is coming to the front and bids fair to become a prosperous mining camp.

THE INDIAN VALLEY MINE.—*Greenville Bulletin*, July 25: Very good work is now being done in this mine. Two developments have lately been made in the Blood tunnel at points where it was generally supposed that no quartz of value existed. The ore extracted is being milled, with very satisfactory results. Mr. Prentiss informs us that more ore per stamp is crushed daily than ever before. He thinks it may become necessary for him to put on more cars to keep the mill supplied with quartz.

Shasta.

THE NIAGARA MINES.—*Shasta Courier*, July 28: The group of mines owned by the Niagara Mining and Milling Co., French Gulch district, is one of the finest mining properties in the State. It embraces 18 locations on good free-gold ore, and Government patent secures the title. On the ground is an 18-stamp mill, batteries and all the appliances required to work a great mine. A commodious boarding and lodging house for the workmen, blacksmith shop, etc., is there, and as good a complement of practical and efficient miners and millmen as can be found anywhere take pride in holding situations on these works. Supt. James Sutherland, like Supt. John Sutherland before him, is a thoroughly practical man, well fitted for the place he occupies, and every person at the works respects and likes him. That the Niagara mines and mill have contributed greatly to recruit the gold output of the State is known; that there are millions of dollars still to be taken from the Niagara group of mines is undoubted—in fact, assured—by what has been accomplished. The displacement of the old works that have been used, by a new plant of machinery, indicates that business will "hum" in a more lively manner than has ever been heretofore known in French Gulch district.

FROM IGO.—*Cor. Shasta Courier*, July 22: C. J. Russell is digging a ditch to take water from near the head of Eagle creek. He is going to put in machinery of some kind to work his Centennial ore. E. L. Ballou is running his large pile of tailings over a Shaw concentrator. It is also regrinding a portion of the same in his astras. Shirland Bros. have just finished a run of ore from the Live Oak, and are now crushing Pacific ore. Ledge looks well. P.

Gibney is doing some work on his claims. He has a good showing of low-grade ore in large quantities. Briggs & Kitchen have been prospecting in Kanaka, with indifferent success so far. J. P. Wright is running his lower tunnel to extract sulphurets ore for shipment. D. F. Bennett has found a body of free-gold ore on the Red Warrior. A test of the same in Wright's astras was quite satisfactory. Water is holding out well this summer.

CINNABAR.—Elisha Dack came down from the Dack cinnabar mines above Trinity Center a few days ago and will take his family from Andersonn up there to spend the summer. The works are in operation, and the Lost Confidence mill on Iron mountain uses up all the quicksilver that can be brought down. At present, the flasks have to be packed on mules, 12 miles over a rough trail to Trinity Center, which is slow work and tough on animals.

SEAM DIGGINGS.—John H. Stowell was down from Copley Wednesday, and from him we learn that Bob Trimble and Jim Murphy have struck good pay in the shape of seam diggings about 100 yards south of the Copley section-house. The gold is found in decomposed quartz. It is probable that there are other rich seams in that vicinity, as the gulches about Copley all paid well when worked years ago—in fact, they paid when worked the second time.

Sierra.

QUARTZ.—*Mountain Messenger*, July 28: Paul Meroux and Val Harting discovered a rich quartz ledge up the East Fork last week. A location has been made.

POKER FLAT.—Louis Cook was over from Poker Flat last Saturday and reported a good prospect in the Nevada City quartz ledge at Little Grizzly—decomposed ore, six feet wide. In early days quartz gold in \$100 and \$1000 pieces were found in the gravel over this ledge.

RICH ORE.—M. Lawler of American Hill has recently struck a fine body of rich ore in his ledge with the tunnel which he has been running since last fall. Gold is visible in nearly all the rock and the vein is about eight feet wide. He has tapped the ledge full 100 feet below the surface and is assured of a very valuable property.

Tuolumne.

RESUMED OPERATIONS.—*Union Democrat*, July 28: After several weeks of inactivity the Buchanan mine has resumed operations again. The mill, however, is not in operation, owing to a lack of water. Paul Morf, from his mine at Mt. Elizabeth, reports considerable progress and says that should the lead hold out in its present prospects and dimensions, he will be more than satisfied. G. A. Fischer of Tuttle town has opened the Leonard mine, which is but a short distance above and to the west of the Patterson mine. He has cut the vein in two places and in one of them the lead is about six feet in width and is considered to be splendid milling ore. Harry Kirke was in town this week from the Pine Nut mine of Dr. J. Walker, on Turnback creek. He and Mr. Fitzgerald have been opening the mine for some time, and it now looks remarkably well. It is reported that the mine of Mr. Geo. Mapes on Yankee Hill is looking fine and in all probability it will develop into a big property. Almost daily there are passing through Sonora loads of machinery for the Eureka Consolidated mine at Summerville. A 20-stamp mill from El Dorado county is to be erected there, and it is largely this machinery that is being forwarded. The mill will be erected as early as possible. Judge Philip Stoner and Dr. Tibbet of Columbia have struck it rich in their claim at Yankee Hill. These gentlemen have, for the last six months or more, prosecuted the sinking of the shaft with more or less variation in result, until last week, when a splendid body of ore was reached. We understand that the Lane mine at Dickson's ranch, a mile from Sonora, is improving as depth is attained. The main shaft is now down 85 feet and the quartz looks exceedingly well. Water, however, is coming in quite freely. This has necessitated the erection of an engine, and one of 10-horse capacity is being placed in position. From Joseph Hampton, who, in association with Wm. Long, is working the Cardinell mine at Tuttle town, we learn that a prospect has now come in the winze which they are sinking in the north drift. Should a chute or deposit be discovered, which now appears to be within the probabilities, it will no doubt be a bonanza, as the early workings of the chutes of this mine yielded about \$300,000. On or about the 12th day of last month the Colorado Mining Co. recommenced operations on the Tuolumne river at a point about two miles above the famous river claim of J. R. Moffit at Moffit's bridge. The company employed 20 men and directed their operations to the turning or deflecting of the river. Excellent success was had until the latter part of last week, when the rains in the mountains raised the river and necessitated the temporary withdrawal of the force. However, on Tuesday of this week the river had so far subsided as to permit a resumption of operations. The present works will drain about 1300 feet of the river-bed. Two breast wheels and probably a third one will be placed in the river for pumping-power. This large undertaking is under the management of Messrs. E. R. Cody and H. W. Keith, who expect to reach and commence on the gold strata about the 15th of next month.

SUMMERVILLE.—*Tuolumne Independent*, July 28: Summerville is having a lit le boom, while the prospects are good for its growing. Freight teams pass through Sonora almost every day, carrying mining machinery and necessities, the major portion of which is for the Eureka Co. Prospectors swarm over the hills, the village is full of strangers, evidences of business enterprise are to be seen on every side, the gold fever is on, and Summerville may yet, as she did in days gone by, stand on top of the heap.

NEVADA.

Washoe District.

CHOLLAR.—*Virginia Enterprise*, July 28: On the 650 level the north raise is in ore of a fair-milling grade. The face of the north drift on the 450 level continues in low-grade quartz. All is in readiness for starting up the 20 stamps that are to be run by electricity, but the dynamo and motors have not yet arrived. Only 20 stamps are at present in operation at the Nevada mill, and these are running on Hale and Norcross ore. It seems that now that

the California mills have been started up there is not enough water to run more than 20 of the 40 stamps at the Nevada mill.

CON. CAL. VIRGINIA.—West crosscut No. 2, from the north drift from the north end of the stopes on the 1500 level, is still in ore of a fair quality. The southeast drift from the north upraise from this level is passing into quartz that shows value. The southwest drift from the upraise from the 1650 level is yielding some good milling ore. Sixty of the 80 stamps at the California battery-mill were started up last Thursday, with a suitable proportion of the amalgamating apparatus at the pan-mill.

HALE AND NORCROSS.—On account of the scarcity of water at the river, are not yet working more than half the usual quantity of ore. The ore extracted is of better grade. The usual dividend will be paid. The stopes throughout the mine continue to look well. Twenty stamps of the Nevada mill are being run on ore from the mine, also half the stamps of the Mexican mill on the Carson river.

WEST YELLOW JACKET.—The drift 60 feet below the surface has cut a feeder of quartz about 20 inches wide, from which assays as high as \$112 a ton have been obtained, 80 per cent of which was in gold. This mine is situated west of the town of Gold Hill, on the north side of Crown Point ravine, near the Ophir grade.

BELCHER.—On the 500 level a crosscut is now out 122 feet. A good deal of repair work has been done to the engines, etc., at the old shaft. The buildings at that point are now all about completed. Good progress is making in the connecting drift coming from the Sutro tunnel.

OCCIDENTAL.—Extracted 126 tons of ore and shipped to the Atlanta mill 150 tons. Average assay of wagon samples, \$30. Shipped bullion to the San Francisco office of the assay value of \$4400.66, and have on hand in the assay office in this city bullion of the value of \$1500.

POTOMAC.—On the 650 level the south drift is out 260 feet. The total length of the south drift on the 550 level is 690 feet. The drift is still in quartz that yields fair assays. On the same level east crosscut No. 2 is out 105 feet, and is passing into a mixture of quartz, clay and porphyry.

GOULD AND CURRY.—During the week there has been extracted from the 250 and 300 levels and shipped to the Douglass mill 243 tons and 300 pounds of ore. The average battery assay is \$23.54. Shipped to the San Francisco office bullion of the assay value of \$4514.12.

CONFIDENCE.—A raise joint with Challenge is being made from the 1200 to the 1100 level. Daily shipments of about 175 tons of ore are still being made to the Brunswick mill. A good deal of repair work is in progress in all parts of the mine.

SAVAGE.—Are extracting about 50 tons a day, which is being shipped to the Rock Point mill. More ore would be extracted but for the low stage of the water in the Carson river. The usual amount of prospecting is in progress on the several levels.

IOWA.—Have completed arrangements for opening a level from the main shaft to develop the Moscow or red ledge at a greater depth than that to which it has been stripped by the south drift from the McBee tunnel.

ALTA.—The stamps and concentrators are running steadily and the usual amount of ore is being mined on the 825 level. The machinery at the Keystone shaft will start up about August 1st.

EXCHEQUER.—The face of the northwest drift on the 122 level continues in quartz of favorable appearance. On the 222 level the face of the east crosscut is in quartz and porphyry.

LADY WASHINGTON.—Good progress is being made in the northwest drift on the 725 level. Expect that it will cut the Keystone vein in going a farther distance of from 30 to 40 feet.

BEST AND BELCHER.—El Dorado level: The main northwest drift from the main west drift has been extended 53 feet; total length, 527 feet. Formation, porphyry and quartz.

YELLOW JACKET.—Owing to the low stage of water in the Carson river, no ore is being shipped. The principal work now being done is in the way of repairing and prospecting.

BALTIMORE.—The pumps are working well, and the usual prospecting work is being done on the 300 level. Some streaks and bunches of good ore are being encountered.

CROWN POINT.—On the 600 level the north drift is being advanced into quartz showing some ore. On the 700 level the crosscut is still in streaks of clay and quartz.

SEG. BELCHER.—Work in the upraise from the 1300 level is progressing favorably, and streaks and bunches of ore of a fair grade are being encountered.

OPHIR.—Good headway is making in retimbering the surface portion of the shaft, repairing gallowframes, etc.

UNION CON.—Are awaiting the completion of repairs to the Ophir hoisting frame to resume explorations.

SIERRA NEVADA.—West crosscut No. 1 on the 250 level is still in a mixture of quartz, clay and porphyry.

BULLION.—Fair progress is being made in the main south drift from the bottom of the 640 level winze.

MEXICAN.—Mining work suspended pending the completion of repairs to the Ophir hoisting works.

CHALLENGE.—A raise joint with Confidence is being made from the 1200 to the 1100 level.

ALPHA.—Good headway is making in sinking and timbering the main shaft below the 380 level.

ANDES.—All is going on about as usual in the prospecting drifts of the 240 and 350 levels.

CON. IMPERIAL.—Making repairs in the main north lateral drift.

BENTON.—Some prospecting is being done on the 725 level.

Buel District.

TO BE REWORKED.—*Cor. Reno Gazette*, July 24: Buel Mining District is situated about five miles from Tecoma station, on the south side of the Central Pacific railroad. The Nevada and Utah line runs through the district, the western part in Nevada and the eastern part in Utah. This district is another of the old discoveries, and after considerable preliminary and well-directed prospecting was done

resulted in opening out some small bodies of pay ore. Of late a Salt Lake company has been working the principal mines, but with what results I am not informed. The formation is soft and easily penetrated. The ores of this district are chiefly galena, carrying some copper. The low ruling rates of copper and lead heretofore, together with the depressed condition of the silver-bullion market, has given but little encouragement for the resurrection of this district. Fair prices for its production and good management in the mining and reduction of its ores to bullion, would bring this once well-to-do camp to the front as a silver-producing district.

Delano District.

AN OLD DISTRICT.—Cor. *Reno Gazette*, July 23: Some 20 miles northwest of the Central Pacific railroad, from Tecoma, is situated the Delano district, which was discovered and organized during the early days of prospecting. Quite a number of ledges were located, but not sufficient work to determine the prospective value of the claims was performed. There were, however, a few carloads of ore extracted, sent and worked at Salt Lake City, from which the owners realized good pay, but by the time the heavy cost of transportation by train to the railroad, thence to Salt Lake by car, including other incidental expenses, as well as the cost of reduction, were met, little was left for the mine-owners, and therefore this mode of operation was abandoned. The major portion of the ore is of a galena character. This district, like others of its kind, was given up and abandoned by the miners, wood and water both being scarce. The district is in the most northeasterly portion of Elko county, near the Utah and Idaho lines, bordering on Thousand Spring Valley on the southwest, and is not far from the Goose Creek range.

Pioche District.

THE YUBA MINE.—Pioche *Record*, July 28: Development work at this mine goes on steadily; the quantity and quality of ore uncovered the past few months is most gratifying to the owners. The property is generally known as the old American Flag mine and was worked in the early '70's for milling ore, the main shaft then reaching a depth of about 200 feet. As depth was attained the ore changed in character to lead or smelting ore, of a grade which at that time it was unprofitable to mine, and work was suspended. The claim was afterward forfeited and relocated and was purchased by the present owners last April. Before the sale the property was under bond for some time, during which the shaft was reopened to the ninth level where the vein of base ore formerly abandoned was found. The vein is a contact fissure following a dyke of porphyry. Two separate and distinct veins of ore are now uncovered, both lying north of the shaft. The first and main ore body, which was reopened on the eighth level, is a base sulphuret, assaying well in silver, however. This vein on the ninth and tenth levels has been developed for a distance of about 100 feet east and west, and by stopes and winzes is shown to extend to a depth of about 300 feet from the eighth level. It is believed to extend to still greater depth and the work of cleaning out the shaft to the twelfth level is now in progress. This ledge now opened carries ore averaging 10 width from 1 to 8 1/2 feet, which is divided into two classes, the first class averaging 90 ounces and the second 45 ounces in silver per ton. About 15 per cent zinc is contained in the ore in this ledge, which renders it difficult and expensive to treat. The second ledge opened is on the eighth level about 25 feet north of the shaft. Developments are here made for 40 feet east and west showing a vein of ore averaging one foot in width. The character is a mixture of smelting and free-milling ore, the latter character predominating. The former carries 200 ounces and the latter 70 ounces in silver per ton. Of the ore extracted while prospecting the above developments, a portion of the better grade has been shipped to the Salt Lake smelters; the remainder lies in the ore bins and on the dump at the mine. The present work is exploration work merely, prosecuted solely to determine the extent of the ore bodies, and but 18 men are employed in all.

Tuscarora District.

NAVAJO QUEEN.—*Times-Review*, July 28: North crosscut, 200-foot level, advanced 17 feet. Have increased the force and will make better headway in the future.

NEVADA QUEEN.—The 450-foot level has been extended 24 feet, the ore extracted being high grade, the face still to ore, two feet of which averages \$450 per ton. There is quite a flow of water coming in through the face. The stopes above the 350-foot level range from 5 to 18 feet wide, and show well the entire length, there being very little waste. South, they extend to the North Belle Isle line; north, the ore still continues as the stopes are opened up. During the week 70 tons were extracted averaging over \$200 per ton, and 180 tons of concentrating ore, average assay from car sample \$26 39-100 per ton. The south drift, 90 feet below the 300-foot level, is exposing high-grade ore.

GRAND PRIZE.—East drift, 200-foot level, extended nine feet, and west drift, same level, 17 feet, both faces showing a good vein of ore. The stopes above this level are looking and yielding well, the upper ones showing chloride ore assaying as high as \$1000 per ton. The 300-foot level stopes are running out well both as to the quantity and quality of the ore. The mill was started up last Monday morning, is running all right and doing good work.

FOUND TREASURE.—The stopes are producing the usual quantity of high-grade ore. A 10-inch steam pump will be placed in the shaft during the coming week.

NAVAJO.—North drift from No. 2 winze on east vein, 250-foot level, extended 12 feet; the face shows some good ore. The stopes are yielding as usual.

NORTH BELLE ISLE.—Work has been suspended for the present on the 70 and 150-foot levels. Good progress is being made on the concentrating works.

BELLE ISLE.—East crosscut from north drift, 250-foot level, extended 10 feet. The face shows more favorably. The stopes are yielding as usual.

COMMONWEALTH.—The east lateral drift from main south drift has been extended 13 feet; the ore continues high grade. No. 1 winze from main south drift has been sunk 13 feet; total, 37 feet. The ore has been good all the way down and still shows well in the bottom.

Silver Zone District.

MAY BE PROSPECTED.—Cor. *Reno Gazette*, July 24: Silver Zone is situated some 25 miles south of Toa-

no on the Steptoe range. The formation is lime and granite. The ores of the district carry silver and copper, and at the time of its discovery, some 16 years ago, good paying prospects were obtained from several of the ledges, but as the holders of these claims were poor men and they were unable to call the attention of the capitalists, the district was finally abandoned.

ARIZONA.

SUCCESSFUL RUN.—*Prescott Courier*, July 28: Miners of Big Bag and Walker districts who have called at this office assured us that, in their opinion, the Van Name mill was making a successful run. Hope so, for if we are not woefully mistaken there are hundreds of tons of ore ready for it on dumps and thousands of tons in the mines. Success would be greatly relished by us, for the sake of the miners, the country and the mill-owner, Wm. Van Name, who is a high-grade man. Fred Smith was here yesterday from head of Hassayampa creek, where J. W. McGowan, superintendent of the Senator, has about 30 men getting out timber, putting up machinery, etc. The camp is about 8000 feet above sea level. O. F. Place, superintendent of the Moody and Place, is on his way back to his mines. He is building a mill. Messrs. Engle and Cooper have discovered a ledge near Bishop's station, a few miles east of Prescott, top rock of which sampled 68 ounces to the ton in silver. They are workers and will take out plenty of ore. The vein is 18 inches thick. Our Tip Top mining friends are preparing to return home. They are the boys that dig out silver ore that goes from \$50 to \$1000 per ton. Nothing less than \$1000 ore will pay in that district. While our miners are O. K., it grieves us to have to say that most of the mills and things that have been erected here to work the ores have not done so successfully, and were it not for the railroad and the ore sampling works, but little bullion would have been taken out in the past year.

MILL RUNNING.—*Prescott Journal-Miner*, July 25: Chas. A. Girdler is now running the Etta mill. The mine has been closed down temporarily, as difficulty has been experienced in saving the gold. The mine is said to look better at present than ever before, there being five feet of good ore at the lowest workings.

NEW DISTRICT.—Sam F. Powell has recently discovered a new district south of the Walnut Grove dam which he has named the Black Dog district, and which promises to come into prominence at once if the surface croppings are any guide. One claim, named the Thompson, located by Sam F. Powell, W. W. Vanderbilt and Chas. Thompson, has a ledge 18 inches wide, which sampled across its entire width \$594. It is rich in horn silver, and picked specimens from it run away up into the thousands. While prospecting in the same vicinity, Powell also ran across some very high-grade lead croppings sticking away up out of the ground and made 12 locations. On one, called the Lead Chief, he can walk on the croppings for a distance of 500 feet, the ledge being four feet in width and the ore being a beautiful fine-grained galena, assaying 77 per cent lead and \$46 in silver. A number of the other claims located show ledges varying in width from six to ten feet and the ore assaying from 17 to 48 per cent lead and running well in silver. He also located two claims which are very rich in copper ore. The district is close to the proposed route of the railroad, and the discovery has created a great excitement in that section. Mr. Vanderbilt, who is a partner with Powell in these claims, has forwarded a load of tools and supplies to the camp and will commence at once to prospect the claims, being sanguine of obtaining good shipping ore from the very surface. The samples brought in are all fine smelting ore, and there is abundance of both water and timber in the immediate vicinity.

WATER SCARCE.—Two men are making good wages out on Lynx creek by packing water on four burros for a distance of two miles with which to wash out gold. They pack ten gallons to each animal at a trip, making from two to three trips per day. There is no better evidence of the richness of the gravel than the fact that by this crude method they are able to make excellent wages. Louis Johnson was up from Tip Top yesterday with a shipment of ore to the sampling works, from the Fourth of July mine, owned by him and Thomas Wade. This mine has produced thousands of dollars already, having been formerly worked by B. C. Williams. The ore runs some \$600 or \$700 in silver.

SHIPPING ORE.—Tip Top miners are shipping their ore now to the Prescott Sampling Works. While they are not able to realize quite as high a price for the ore, owing to the mountainous roads between the two points, they have the advantage of getting spot cash for it here, while in shipping via Phoenix they are compelled to wait from 30 to 60 days to get returns. W. B. Long, superintendent of the Oro Bella Company, says both properties which his company are working—the Oro Bella and Oro Bonito mines—are developing very satisfactorily.

BRITISH COLUMBIA.

IS IT ANOTHER EL DORADO?—Donald Truth, July 27: Along in the 60's, shortly after the discovery of the rich diggings on Wild Horse creek, in the lower part of this county, adventurous prospectors penetrated this region and searched for gold on Quartz creek, but met with indifferent success. In 1885, during construction times, a number of out-fits went in from the Beaver, some of them working all summer. Billy McVeigh, Cassiar, three of the discoverers of the new find, and others now residing in Donald were of the number. Considerable work was done and gold taken out, but the ground was for the second time abandoned. Early this spring two men went over to the creek, but the snow was too deep and they had to return. Later, Harry Lowell, G. B. Nagle, Raymond Allen and Tom Horn, all old-time prospectors, packed in some grub and began prospecting the creek and its branches. In the forepart of this month they made a discovery on Porcupine creek, a tributary of Quartz creek. They report taking out \$1.70 worth of dust an hour to the mao for the short time they worked, one nugget weighing over 50 cents. The creek-bed is from 150 to 200 feet wide, with gravel banks carrying coarse gold. Bedrock is reached in from 4 to 6 feet, with but few large boulders interfering. There is about 75 miles of water with which to work

the 6 miles of ground, it prospecting good for the entire distance. It is safe to say the diggings are worth over \$6 a day to the man. These gentlemen intend to put in a bedrock flume to work their ground. At present they are engaged in cutting out a trail so that the creek can be reached from Donald, the present trail from the Beaver being too roundabout. Porcupine creek is about 25 miles from Donald, and parties of two and threes have already started in, going by the way of the Beaver.

ILLE-ILLEWART.—Donald Truth, July 28: The men employed on the dump at the Lanark mine struck for higher pay on Thursday. They were immediately paid off and discharged, their places being filled by men from the railroad. The Skirk Mining Co. shipped two carloads of high-grade ore to San Francisco this week.

FIELD.—The English syndicate who purchased the Coffman Tunnel mountain mines last spring have commenced operations by erecting a boarding-house and other buildings necessary for development work.

TOBY CREEK.—A number of prospectors have taken up locations on this creek and are doing assessment work. The claims are said to look and promise well. The district is on the west side of the Columbia about 35 miles above Jubilee.

COLORADO.

WORKING.—Elk Mountain *Pilot*, July 28: Work has been resumed on the old Painter Boy mine, Washington gulch. The Augusta tramway is again in place and ore from this mine is coming down. The Daisy mine in Redwell Basin shipped three carloads of ore last Tuesday to Denver. Last week three carloads were shipped, and in fact the mine has shipped three carloads every week since it has been shipping this summer. This is remarkably good for a mine that is only employing two men. The ore from this mine runs over 50 per cent lead and free from zinc, which makes it a desirable smelting ore. A. L. Horner of St. Louis, Capt. E. W. Burton and W. J. Fine of Gunnison are up Washington gulch this week inspecting the Painter Boy mine and also the placers. There are prospects of considerable work being done up there this summer. The miners of Yule creek are about to have a road built from Slate river over to their mines. Geo. L. Brown, Alex. and John Harvey of Leadville have been over here for several days looking after some mining claims belonging to them, situated on Cement creek. They are working a small force of men at present, and should an ore body be opened up to give sufficient encouragement, they will do considerable more work.

DAKOTA.

SUCCESSFUL TEST.—Deadwood *Pioneer*, July 24: The Hartsfeld smelter started up at nine o'clock Saturday night and shut down at nine o'clock last night, having run just 48 hours, and having produced a ton and a half of bullion valued at about \$500; \$360 silver and the balance in lead. This resulted from 16 tons of ore furnished by the Bullion and Merritt mines, the Bullion furnishing two tons to one from the Merritt, the latter ore carrying a greater per cent of lead. The run was better than anticipated. The promoters of the undertaking realized they had many obstacles to overcome, many difficulties to contend with. It was stated, and perhaps truthfully, that a Hartsfeld smelter of five tons capacity might be found in every mining camp of the West, and that not one of them had ever proved a success. Last year's failure with this was referred to. Such critics did not, however, consider that W. B. McPherson and J. A. Short had almost entirely remodeled the plant, doubled its capacity, added a lead well and water jacket, and otherwise improved upon it in various ways. The gentlemen deserve credit for the work and are to be congratulated upon the success it has met. The run was a test upon which much depended.

IDAHO.

DEADWOOD BASIN.—Boise *Statesman*, July 25: Mr. I. C. Hall is in from Deadwood Basin and reports that they will have the Deer creek ditch completed and water turned in this week. They have used a ton of giant powder in blasting bedrock this spring which they did not anticipate would trouble them. They have worked 25 men on the ditch this season. The heaviest work was done on the ditch last fall. It is 8 miles long and will carry 2000 inches of water. The diggings under it have been thoroughly prospected and are known to be good. Mr. I. C. Hall, his brother L. P. Hall and friends in New York took hold of this work last summer, and they will spend \$50,000 before they will be able to make returns from their placer mines. Mr. Hall says the quartz mines in that vicinity are large and rich. What they need is a wagon road to reach the camp.

A GOOD STRIKE.—Wood River *Times*, July 25: K. H. McLeod, foreman of the Silver Fortune group of four mines, up the east fork of Wood river, was in Hailey to-day, getting samples of a new strike at his claims assayed. This strike consists of an 18-inch vein of solid steel galena, which was cut into last evening, on the Oregonian, one of the claims of the group. The property has heretofore been considered a low-grade proposition, the ore having only averaged 82 to 83 ounces silver and 68 per cent lead; but this new strike promises to be of much higher grade. The strike was anything but a surprise to the parties interested, as they had been expecting to find ore for some time past.

NEW MEXICO.

PEERLESS.—Silver City *Sentinel*, July 24: We are reliably informed that the Peerless Mining Co. have leased their property to Andrew Stewart, Esq.

IN BONANZA.—The Silver Belt, Santo Domingo gulch, Pinos Altos district, the property of McKnight & Co., at 40 feet in depth is in bonanza. The ores are heavy sulphurets of copper, galena, with some zinc. The work up to the present has been confined to development only.

OREGON.

THE CRACKER CREEK MILL.—Bedrock *Democrat*, July 23: Mr. Donaldson, superintendent of the Eureka and Excelsior mine, in Cracker Creek dis-

trict, has contracted for 110,000 bricks, to be used in constructing the furnace of the new mill soon to be in operation there. The brick will be manufactured near the mine. The mill will be in successful operation, it is said, within the next 65 days.

MORE EVIDENCE.—Mr. J. H. Bacon returned yesterday from a visit to the Cracker Creek district, bringing with him a most cheerful account of the outlook over there, and some as nice specimens of gold sulphurets as one could wish to look at. Cracker Creek is alive with strangers; some mining, some prospecting and some building towns. Its growth as a camp will not be phenomenal, but it will be steady, and as the mines are there to warrant a heavy yield, the chances are that it will always be a good and lively camp.

NOTES.—Jacksonville *Times*, July 26: Considerable mining is now being done in Silver creek district. The Sterling Co. is still pining, but will commence cleaning up before long. Geo. Jensen and Jacob Klippel are now prospecting the Col. Irish ledge, from which such rich ore was recently obtained. Desselles & Connell, proprietors of the Scotch gulch mines, near Waldo, made their final cleanup recently and did well. Chas. Agee, who has a claim not far from Kerbyville, took out several hundred dollars, notwithstanding the unfavorable winter. Henry Klippel, Thos. T. McKenzie, Jesse Simpson and others are prospecting on Applegate, and think they have struck a big thing. Thibau Bros. of Ashland precinct have returned from a prospecting trip to the vicinity of the Three Sisters, where they obtained some excellent ore. Less than 1000 pounds of quartz from the Col. Irish ledge in Willow Springs precinct was crushed in Sanderson Smith's mill near Gold Hill last week, from which \$116 was obtained.

UTAH.

REVIEW.—Salt Lake *Tribune*, July 28: Last week saw the stoppage of the Germania smelter; this has seen the stoppage of two stacks of the Mingo; the Hanauer producing about as usual, with some uncertainty whether it will follow the example of the others or not. The cause of shutting down is the unsatisfactory freight-rates. Other causes, however, have been in operation since the drop in the lead market, as the short ore supplies, some of those mining operations which can afford it, holding their ores, and of those who cannot afford it, leaving the ores in the mines. The shipments out from this city for the week ending Saturday, July 21, inclusive, were 1,829,832 lbs., being an unusual quantity of ore. It would be interesting if we could have returns of the yield of this ore sent away, compared with the result when smelted in this valley. The product of the Ontario for the week was \$875.23 from ore sales and of bullion, 27,251 fine ounces; an approximate value of \$29,402.23. The Daily output for the week was 9605 fine ounces of bullion and \$9948.82 from ore sales; a total, approximately, of \$19,553.82. The Horn Silver makes no local showing; probably it is doing next to nothing. Fine bar receipts in this city for the week were to the value of \$47,356; base bullion, \$8500. The Hanauer smelter produced during the week, bullion valued at \$18,000. Ore receipts in this city for the week were to the value of \$14,960 by Wells, Fargo & Co.; \$14,400 by McCormick & Co.; and \$7709.83 by T. R. Jones & Co.

PARK NOTES.—Park *Record*, July 28: At the place where the new three-mile drain tunnel for the Ontario will be started the buzz and hum of activity continue. Ground at the tunnel's mouth will be broken in a few days. Work is still going on in Hoyt's Wasatch ground and ore shipments will be resumed soon. James Moray is pushing his Walla Walla tunnel above Lake flat, and it is in about 1500 feet. John Green is driving a tunnel on the Barrios group, on the flat, to strike the discovery ledge.

IN EMPIRE CANYON.—The West Ontario consolidated shaft is down about 560 feet, but sinking has been stopped temporarily on account of the flow of water. Farish & McLaughlin believe that when the Anchor tunnel gets through it will tend to drain their shaft. The large air compressor at the Massachusetts has been started up, and about the middle of the coming week the power drills will be set to work drifting from the 600-foot station.

ORE AND BULLION SHIPMENTS.—During the week the Crescent shipped 260,000 pounds of concentrates; no first-class ore. For the week just ended the Mackintosh sampler received 34,220 pounds of Ontario ore and 432,820 pounds of Daly ore. Last Tuesday the Ontario shipped 41 bars of bullion, containing 19,126.77 fine ounces of silver.

CAMP CROSSCUTS.—The 14th regular monthly dividend on Ontario stock will be payable on Wednesday. It is of 50 cents a share; aggregates \$75,000, and brings the total up to \$945,000. The Marsac mill after undergoing a thorough overhauling and repairing, occupying two weeks, started up last evening.

ALONG BONANZA FLAT.—Smith Ehenger is pushing work in his No. 3 tunnel, west of the Anchor, with favorable results. Geo. Pierson has resumed work on his Red Oxide tunnel on Pioneer Ridge; it is in some 300 feet. Four men are working in the Lucky Bill. They are running the tunnel to cut the ledge.

OVER IN SNAKE CREEK.—Another rich discovery has been made to the Southern Tier group. No work is at present being done on the Black Diamond, but Manager Pierson believes that the Board of Directors will order developments to be resumed shortly.

WASHINGTON.

MINING OUTLOOK.—Colville *Miner*, July 26: Contrary to what many would suppose from the reports that go out from this section of country, there is a remarkable activity in mining in this district. Several purchases of good property have been made in this district, especially in Clugston creek, where the lead prospects have been very largely developed and where considerable work is going on in the camp. The Old Dominion is being worked with renewed vigor, and weekly shipments of the ore, which is very rich, are coming in in large quantities to Eastern markets. The Chewelah district is proving of much more promise than heretofore, the output being of such a character of ore that shipments will be made therefrom the same as from the Old Dominion. The general nature of the mining interest is by no means deteriorating.

MECHANICAL PROGRESS.

Forging by Pressure or by Blows.

Very many forging presses are now in use for making large and heavy pieces, and the relative effect on the work is thus summed up by Prof. Kick, who has published in the *Technische Blätter* an interesting account of the experiments he has made on this subject. The difference between static pressure and that which results from a shock consists, he says, in the duration of their action. The weight of the hammer and the height of the fall determine the total energy expended, but the power of the shock for a given expenditure of energy itself depends on the compression produced in the object struck. The feeblest this compression is, the greater is the relative force of the blow to the pile. He has made some comparative experiments between the effects produced by an ordinary pile-driver striking upon an anvil solidly fixed, and by a ballistic hammer, or one where the driver and anvil are both suspended like pendulums, so that the anvil is free to move. He has found that within rather large limits the work employed in the deformation of an object under the action of the shock only depends upon the product of the weight of the driver and the height of the fall for heights varying from 0.50 to 3 meters. The test pieces were small copper cylinders, fitted on the same rod, and of the same initial dimensions, 16.9 mm. long, 12 mm. in diameter, and weighing 18.4 grammes. One of the series has been submitted to the action of an ordinary driver, and the other to that of a ballistic driver, taking care to obtain equal shocks under the two conditions. The weight of the anvil of the ballistic driver was to that of the driver in the proportion of two to one. The experiments have shown that a greater deformation is obtained by the ordinary than by the ballistic drivers, all other things being equal. With the latter, a calculation of the proportion of force transmitted to it can easily be made, and it was found that 30 per cent of energy was expended. Other experiments made with the same apparatus have enabled the necessary energy of both to be determined on analogous eprouvettes. It was found that the ordinary driver expends seven, and the ballistic driver nine. On the other hand, the latter provided with an anvil, the weight of which was equal to four times that of the driver, gave the same results as an ordinary driver with an anvil firmly fixed, and the weight of which was equal to 20 times that of the hammer. Test pieces, as nearly as possible like those made use of in the preceding experiments, both as to quality and dimensions, have been tested by Prof. Golinier's machine for testing metals, and the work necessary for obtaining a certain compression has been compared with that of a shock susceptible of giving the same results. The relation of the latter to the former is about 1.5. But this value varies according to the case, and increases for very hard materials and with the number of blows. Mr. Kick estimates that the weight that should be adopted for anvils on which iron is to be forged should at least be eight times that of the hammer, and for steel 12 times. He considers that the anvil absorbs at least 20 per cent of the force produced, and that the rest is lost in vibrations of the anvil and of the hammer, and in the elevation of the temperature of the object to be forged.

Pulverized Fuel.

A correspondent of the *Boston Journal of Commerce* writes to that paper as follows: "About 12 years ago I had a model of a cupola made to show that a great many things that were wasted could be used for fuel if ground fine and blown into the tuyeres of the cupola. I paid \$12 for the model, and was so anxious to get it that I waited very late one night until it was finished, all the time thinking what big things I should accomplish with coal dust, sawdust, and I don't know but street dust. After I got to the house that night I took up a Pittsburgh paper and read an article giving an account of the superintendent of the Edgar Thompson Steel Works being bothered with one of his large cupolas bridging over so that he could not put in any fresh stock, and the fuel was burning away that was put in the cupola, so the prospect was that the cupola would be completely humped up; but he took out the tuyere pipes and filled them with fine coal, then put in the pipes and put on the blast, and in a very short time the bridge melted down and he got out the heat in good shape. The only consolation I had was that my theory was practical, but some one else had got the start of me, because it was something I had been thinking over for years. What makes me speak of it at this time is that I have been reading a piece in the paper, stating that pulverized coal would give a better result than natural gas; that 50 per cent of the coal now used in furnaces and rolling-mills could be saved, and steel and iron greatly improved in the puddling process; and they were bold enough to say that they would confront natural gas right in Pittsburgh with sprayed coal. Now, a great many will say this is cheap talk. I don't think it is. I think there is something there that is worth looking into. I know that many useful things have been laid aside from some sneering remark from parties that did not know at the time they made them that they were hurting

themselves more than the man they were poking fun at. There are lots of people all over the world that appear to enjoy walking in the old ruts, even if it costs them five times as much to do it. Such men as these give themselves dead away every time they open their mouths. Our old-fashioned way of doing things is played out both in melting, molding, and core-making, and the parties that will fight the hardest against any change will be the ones that will be benefited the most by the change—that is, the workingman, because I know that what we are doing to-day can be done with a great deal less worry to the men, and a great deal less cost to the employer, both in our foundries and rolling-mills."

Novel Experiment with Leather Belts.

One of our English exchanges illustrates an arrangement of working two large leather belts, one on top of the other, which has been found to answer very satisfactorily. The particulars are as follows:

In the year 1880 the works where the arrangement is applied put in a double leather belt 135 feet long and 36 inches wide, made on their system, without cross joints, and of even thickness throughout, to transmit 350 indicated horse-power. The engine was a single Corliss, horizontal, with fly-wheel drum 24 feet diameter, 39 inches wide, running 48 revolutions per minute, the driven pulley being 3 feet 6 inches diameter. In consequence of extension of the works more power was required. The engine was, therefore, compounded in October, 1887, and it was arranged to transmit 350 indicated horse-power more, through another line of shafting. Not having space for another drum, and the fly-drum and shaft being strong enough for the purpose, it was decided to run a second belt under the one already at work. This second belt was also double, made on the same principle as the first, 104 feet long, 38 inches wide, driving a pulley 6 feet 6 inches diameter. This addition was started in November last, and the report of the proprietors is said to show that after the first stretching had been taken out of the new belt no other change had occurred, and that the old belt was working perfectly straight upon it, with complete success.

These results were not quite anticipated, as, from the novelty of the application, the makers were rather dubious that cross strains might be set up by slipping of the lower belt from the additional drag placed upon it. In the result, however, the experiment has proved a complete success. The principle may be very readily applied where more power is wanted without additional pulleys.

RUSTING OF SHEET IRON.—The following instructions are given relative to the prevention of rust in sheet-iron stoves: In the first place, all soot and ashes should be removed from the heater or furnace, and all openings closed so that there can be no circulation of air through it. Inside rusting has often been prevented by disconnecting the heater drum from the chimney and tying papers over the pipe-hole in the heater, thus preventing down draught through the chimney into the body of the drum, and the consequent formation of moisture on the inside of the drum as the air becomes cooled. It is suggested that nearly all trouble would be avoided if the heater were disconnected all around and a dish of lime placed in the inside to absorb the moisture. To prevent rusting on the outside, covering up with papers is recommended. The formation of moisture is of course the cause of rust; and though the room may seem quite dry, yet it may be cold enough to condense moisture on the iron if the surface is exposed, and it will then corrode rapidly.

WIRE GAUGES.—The *American Mechanic*, in answer to the question by a correspondent: "Please state if there is any variation between Stubbs' and the American wire gauges," says: "Yes, there is a difference. Stubbs' wire gauge is supposed to agree with the Birmingham wire gauge, which differs from the American gauge. But there are two Stubbs' wire gauges differing entirely from each other, one used for iron wire, the other for steel wire. Altogether the wire-gauge matter is very much mixed, and we think, now that there are other and better methods of determining the size of wire, that it would be better if all gauges, on which the sizes are designated by numbers, were to be abolished entirely, and wire designated and ordered by its actual diameter in decimal parts of an inch."

OIL OF MUSTARD AS A LUBRICATING OIL.—Chief Engineer M. Thier of Erfurt, Germany, says the *Eisen-Zeitung*, after battling for months to find a lubricator which would prevent the welding together of iron surfaces upon which much and rapid friction is exercised, such as turbine wheels, etc., has at last found that ordinary oil of mustard mixed with small quantities of petroleum, fish oil or other similar fatty substances, answers the purpose in every respect and overcomes all the difficulties heretofore experienced with machinery where excessive friction disturbs the physical quality of the metal used.

IRON IN WASHINGTON TERRITORY.—It is predicted that the iron product of Washington Territory will soon exceed that of Pennsylvania.

MALLEABLE BRONZE.—Domier has discovered that bronze is rendered malleable by adding to it from one-half to two per cent of mercury.

SCIENTIFIC PROGRESS.

The Sound of Thunder.

One of the most terse and succinct descriptions of a natural phenomenon is that recently given by Mr. Hirm, in which he says that the sound which is known as thunder is due simply to the fact that the air traversed by the electric spark—that is, a flash of lightning—is suddenly raised to a very high temperature, and has its volume, moreover, considerably increased. The column of gas thus suddenly heated and expanded is sometimes several miles long, and as the duration of a flash is not even a millionth of a second, it follows that the noise bursts forth at once from the whole column, though for any observer in any one place it commences where the lightning is at the least distance. In precise terms, according to Mr. Hirm, the beginning of the thunderclap gives us the minimum distance of the lightning, and the length of the thunderclap gives us the length of the column. He also remarks that when a flash of lightning strikes the ground it is not necessarily from the place struck that the first noise is heard. Again, he points out that a bullet whistles in traversing the air so that we can, to a certain extent, follow its flight, the same thing also happening with a falling meteorite just before striking the earth. The noise actually heard has been compared to the sound produced when one tears linen. It is due, really, to the fact that the air rapidly pushed on one side in front of the projectile, whether bullet or meteorite, quickly rushes back to fill the gap left in the rear.

There is a peculiar reverberation of sound sometimes heard during a thunderstorm which cannot be accounted for on the above theory, but which is undoubtedly due to an echo from cloud to cloud.

How Spectrum Analysis Was Discovered.

Shortly before his death, says the *New York Tribune*, the late Dr. Kirchhoff of Berlin related the true story of the discovery of spectral analysis. He and Bunsen were then professors at Heidelberg and kept bachelor's quarters in the well-known "Riesenstein." Upon one of their daily promenades Bunsen remarked: "Kirchhoff, we must discover something which will be too simple to be true." They returned and went to work. But years passed by before the discovery was effected. Experimenting one day in his laboratory, Kirchhoff happened to place a burning lamp in the rays of the sun. A dark place appeared at once. Thinking it an "optical illusion," he repeated the action, only to find the dark ray reappear and give place to the ordinary ray when the lamp was first removed. He called Bunsen. The experiment was repeated many times and always with the same result. They could not explain it. Finally Bunsen proposed that they go home and "think of other things" for awhile; possibly some explanation might be reached. They idled in their easy-chairs, smoking their long student pipes and talking of the days of their youth and the gossip of the hour. The afternoon had almost passed when Bunsen sprang to his feet with the remark: "Eureka! The flame of the lamp is fed by the same stuff that is burning in the sun!" They hurried back to the laboratory, tried a number of experiments, and the great discovery was made. That night there was a jollification in the bachelor quarters of the modest hotel. A few weeks later the whole world knew of the discovery, and Kirchhoff and Bunsen were enrolled among immortal scientists. The name Kirchhoff, by the way, means "graveyard." At a state dinner the distinguished scientist once made a speech in honor of the guest of the evening, ending with the usual "*Hoch soller leben*." Prof. Helmholtz, now head of the physical institute in Berlin, after listening to the conclusion, was guilty of the remark: "He must be immortal, indeed, to whom the Kirchhoff (graveyard) calls 'Long Live!'"

A RIVAL FOR MOUNT HAMILTON.—Denver is about to have an astronomical observatory that will rival the famous Lick observatory at Mount Hamilton. Its dome will rise from a plain and have 1000 feet greater elevation. The building and instrument have been provided for through the liberality of W. B. Chamberlain of Denver. The entire structure, with its instruments and appliances, will embrace all that skill and science can suggest to make them perfect in every particular. It is not the intention to rival the Lick instrument in size. For general work a large instrument is only an incumbrance. The elevation and atmospheric conditions of the Denver observatory will undoubtedly be superior to those at Mount Hamilton, and the two institutions will doubtless prove the two most useful and effective observatories in the world.

A SCIENTIFIC SCHOOL IN SIBERIA.—Mr. Geo. Kennan, in the current number of the *Century*, makes some statements regarding Siberia which will be a genuine surprise to most people. Among other things found there, which one would hardly expect to find in such a country as Siberia is popularly supposed to be, is a scientific school at Tiumen, which he compares to the Boston Institute of Technology. It is

called the "Realnoi Uchilshche." It occupies the largest and finest building in the town, and was erected and equipped by a wealthy citizen of Tiumen at a cost of \$85,000 and presented to the city. It has a mechanical department, with a steam engine, lathes and tools of all kinds, and a department of physics, with fine apparatus, including even the Bell, Edison, Dolbear telephones and the phonograph, a very complete and well-equipped chemical laboratory, a good library and a department of art and mechanical drawing. When one remembers that Tiumen is 1700 miles east of St. Petersburg, in a country which most every one believes (until he reads Mr. Kennan's article) contains nothing but snow and exiles, the above statements are somewhat remarkable.

HOW LEAVES CHANGE THEIR COLOR IN AUTUMN.—A botanist thus describes how the leaves change their color in autumn. He ridicules the belief that frost has anything to do with it: "The green matter in the tissue of a leaf is composed of two colors—red and blue. When the sap ceases to flow in the autumn, and the natural growth of the tree ceases, oxidation of the tissue takes place. Under certain conditions the green of the leaf changes to red; under different conditions it takes on a yellow or brown tint. This difference in color is due to the difference in combination of the original constituents of the green tissue and to the varying conditions of climate, exposure and soil. A dry, cold climate produces more brilliant foliage than one that is damp and warm. This is the reason that our Northern American autumns are so much more gorgeous than those of England."

IODIDE OF MERCURY IN TANNING SKINS.—The iodide of mercury is now used to some extent in France in tanning skins. It is said that the mercury salts act as a preservative of the constituents of the tanning liquors, and that leather produced from skins that have been previously treated in this manner is superior to that tanned in the ordinary way. It completely prevents the liquefaction of the gelatine which takes place in putrefying hides, and thus saves them from this loss. A saving is also effected by its use in the prevention of the decomposition of the tannin in the tannin liquid, which is usually hastened by the introduction of the hides when in a state of decomposition. The amount of iodide of mercury required is so small that there is no danger of poisoning, either to the workman or to those subsequently using the leather, in its use.

INVENTORS will be gratified to know that the United States Supreme Court has awarded the owner of a glycerine patent \$320,000 damages for infringements. While the license fees which were claimed would have amounted to only \$35,000, the court gave nearly ten times that sum as damages on the ground that an infringer was liable to account for all the savings and benefits derived from a wrongful use of the patent. This case suggests to railway companies and others using inventions the importance of making sure at the outset that they are not infringing any just claims of the inventors; and in this view the value of the Eastern and Western railroad associations, whose business it is to investigate the validity of patents offered to railways, is evident.

ARE WHITE ANIMALS SPECIALLY INCLINED TO DEAFNESS?—A writer in the *Boston Post* says: "Why is it, I wonder, that white animals are so often deaf? The white English terrier is almost always so, and the white English bull-terrier is very frequently afflicted with this defect. I am told by those who are skilled in white oats that they too are apt to have the same infirmity, and I have heard, though I cannot cite my authority on the spot, that a white goat is even more deaf to reason and discourse than other animals of the same species but of positive color. So far as I know, white horses have the usual sense of hearing, though investigation might prove that they were deficient in this respect."

FRESH-CUT TIMBER in very many cases contains on an average about 45 to 50 per cent of its weight in water, and if seasoned in the ordinary way this is reduced to about 15 to 20 per cent, but the fresh timber also contains air, as may be easily shown by warming one end at the fire or in hot water and watching the bubbles drive out; and the seasoned timber contains less water and more air in proportion, so that many sources of error are possible in the usual weightings of timber.

A RULE OF DOUBTFUL VALUE.—It is a regulation in Holland that every professor in a Dutch university shall resign on completing his 70th year. A scientist who possesses a good general constitution and has taken proper care of himself is fully as capable of doing good work at 70 as at any period of his life. Years do not constitute a factor in a man's life and labor, which should be applied to all alike; hence the rule in Holland must be one of doubtful value.

AN ANCIENT FOUNDATION.—Dr. Schliemann's explorations in Egypt show that the great temple described by Herodotus, which occupies a crater-like depression of about 800 feet in the delta and was composed of great monoliths and columns, had no rock foundation, but rested simply on wet, compact soil. But our City Hall must have a solid foundation of concrete.

USEFUL INFORMATION.

How Water Should be Cooked.

"Water is one of the secrets of cooking," sentimentally said a well-known chef to a New York Mail and Express reporter. "I suppose you mean all food in its raw state should be washed?" "Nothing of the kind," replied the artist. "A few cooks understand the many effects produced by hard and soft water in cooking vegetables and meat. If peas and beans, for instance, are cooked in hard water, containing lime gypsum, they will not boil tender, because these substances have a tendency to harden vegetable caselae. Now many vegetables, as onions, boil nearly tasteless in soft water, because all the flavor is boiled out. The addition of salt often checks this, as in the case of onions, causing the vegetable to retain their peculiar flavoring principles, besides such nutritious matter as might be lost in the soft water. Some of the finest dishes in the world are ruined by the use of hard water when soft is required. It is a science that can best be learned by actual experience in the capacity of assistant chef. It requires a long apprenticeship and a natural aptitude to become a great cook and to understand water. Now, to extract the juice of meat to make a broth or soup, soft water, unsalted and cold at first, is the best, for it much more readily penetrates the tissue. But for boiling, where the juices should be retained, hard water or soft water salted is preferable, and the meat should be put in while the water is boiling, so as to close up the pores at once. I have two assistants, and once a week I lecture them on the proper use of hard and soft water in cooking certain dishes. In answer to your facetious question above, I will state that not only raw food should be clean, but that water goes a long way in keeping a first-class cuisine in a healthy sanitary condition."

WHAT A CHINOOK WIND IS.—Chinook, says the Boise (Idaho) Democrat, is the name given by the Indians of the Upper Columbia to a wind that blows from the Japan current, and striking the Oregon coast on the northwest, sweeps across the coastline. The Chinook Indians lived on the Lower Columbia, and this wind, coming from the direction of their home, caused it to be called chinook—from the land of the Chinooks. The early settlers of Oregon adopted the term, and it is now heard all around the world. These life-giving wind belts range in width from one to hundreds of miles, and they cut a path through snow and ice as clean as does a tornado through a forest. Its line of travel is so distinctly marked sometimes that a strip of land can be seen running on a mountain slope with a wall of snow on each side. Its effects have been noticed here this winter. One day here last week the snow was several inches in depth, with ground frozen beneath, and things popping with cold. In 24 hours the streets were muddy.

THE GOOD WHICH RATS DO.—Though the rat is a despised animal, says Good Housekeeping, yet he is a useful servant to man, for the animal lives in and near human habitations and eats every particle of refuse and filth that he can get at. He is the only animal which can thrive and keep a clean coat in the most filthy localities, where the air would be fatal to any other creature. Rats are almost incessantly licking their fur to keep it clean, and, though they doubtless become a nuisance in many instances and places, yet they after all perform great service for mankind, especially in cities, by cleaning up every edible thing that would eventually become a source of noxious odors and of disease.

CASTOR OIL FOR DRAWING WIRE.—A correspondent of the English Mechanic writes as follows in a recent issue: "The Asiatic wire-drawers have very long ago used castor oil in preference to any other kind. Their dexterity is surprising, the wire for the trichinopoly chains of gold and silver being like hair, and every good workman draws his own. A man made me a plate for the fine gauges from a flat rasp of English steel, which I still possess. He drew copper, zinc and brass equally well. Castor oil, being one of the cheapest oils in India, is often used to soften hard leather, shoes and ropes. For feeding large drills I like this oil mixed with soft soap."

HOW TO KEEP AFLOAT.—Numerous drowning accidents occur every summer through lack of knowledge that every boy or girl should acquire as the first part of their education. It is no great art to keep the body afloat, or so much as is necessary to keep above the surface. In the excitement of a sudden submersion, the victim strikes out wildly for help. Generally he or she throws hands or arms above water, and, of course, down goes the head. All that need be kept above the surface is the nose or mouth. Quiet, regular breathing, and the slightest motion of the hands under the water, will keep mouth and nose above the surface. If this were often thought of, few need drown.

A NEW CAR-HEATER.—To provide means of heating steam-heated passenger cars when the locomotive is detached, "a blizzard heater," so called, has been devised, consisting of a fire-brick pit and a telescopic chimney, on the principle of the travelers' pocket drinking cup.

When not in use the whole thing occupies only 101 inches of space, and may be shoved under a seat and out of the way. It is hung by chains from the car roof and floor.

CASTOR OIL LEAVES, fresh from the plant, bruised or rubbed in the hands, and then stuffed tightly into a stiff boot or shoe and left to remain for 12 or 24 hours, according to the character of the leather, will render the same quite supple—so it is said.

LONDON has eight homes for poor working girls, where they can get three tolerable meals a day for \$1 a week.

A POUND of peas is worth \$1.42. A pound of five-cent pieces is worth \$45.50.

GOOD HEALTH.

Impaired Sight of Ironworkers.

It is a fact, says a Pittsburg paper, that a large percentage of the men employed as heaters in the iron-mills of Pittsburg are more or less troubled with defective vision, the nature of their work compelling them to gaze for protracted periods upon the intensely dazzling light of metal at white heat, which they must be able to distinguish from the flames of burning gas which surround it. Secretary William Martin of the Amalgamated Association of Iron and Steel Workers in Pittsburg, says that among men who have worked for a few years in iron-mills, near-sightedness or weakness of the eyes is almost universal, and advised the reporter to interview a few of the employees of any mill in the city to test his statement.

This was done, resulting in confirmation from half a dozen heaters in one of the largest rolling-mills in the city. The men seen had worked in the iron-mills for periods ranging from 3 to 12 years, and with very slight differences their powers of vision had all been affected in the same manner. They are unable to distinguish small objects at any considerable distance. One was entirely unable to read the print in an ordinary newspaper; another pointed out a clock with a dial a foot in diameter, and said he could not see the hands ten feet away. With one the trouble was permanent and unvarying, while another's eyes were restored to their normal condition if he stopped a month. None of them experience pain, and it does not seem to have occurred to any one that a physician's services were needed. They regard the change that takes place in their eyes as a sort of process of "getting used" to the necessary requirements of their trade.

The reporter on looking into one of their blazing heaters could distinguish only a blinding glare, scarcely inferior to the dazzling light of the sun itself. Yet these men must be able to see clearly the white hot masses of metal through the flames of the gas that is burning all around them. The difficulty of doing this may be compared to that which would be experienced in trying to perceive one bright light through another. Yet the experienced heater does it with as much ease as if the hot iron were as much wood floating in water. They say that no degree of proficiency can be acquired in less than three months' time, and that since the employment of natural gas in the furnaces the difficulty has become much greater and the effect upon the eye more pronounced.

IVY AND OAK POISON.—A writer in the Popular Science News gives the treatment which he has often found serviceable in his own case when poisoned with ivy: "I have always been extremely susceptible to the poison of poison ivy and oak, so as to give me great annoyance, unless it is immediately checked on its first appearance. This, common washing-soda does for me, if properly applied. I make the application by saturating a slice of loaf bread with water, then cover one surface with soda and apply to the eruption, the soda next the flesh. When the bread is dried by the animal heat, I drop water on the outer side, so as to keep it thoroughly moistened, and dissolve the soda crystals in contact with the skin. This, you will perceive, is merely a bread poultice, the bread being a vehicle through whose moisture the soda reaches the humor. I find that washing or bathing with soda water, even continually, will not suffice with me. My skin requires the heat and moisture of the bread in order for the soda to act on and neutralize the poison. I rarely have need to retain this soda poultice for more than 30 minutes to any affected part. No pain ensues. Formerly I suffered often for weeks, as the poison would spread all over my body. Now 30 minutes measures the duration of its exhibition."

CONDIMENTS AND INDIGESTION.—BANEFUL EFFECTS OF RED PEPPER.—Cayenne pepper may be selected as a typical example of a condiment properly called. Mustard is a food and condiment combined; this is the case with some others. Curry powders are mixtures of very potent condiments with more or less farinaceous materials and sulphur compounds, which, like the oil of mustard, onions, garlic, etc., may have a certain amount of nutritive value. The mere condiment is a stimulating drug that does its work directly upon the inner lining of the stomach, by exciting it to increased and abnormal activity. A dyspeptic may obtain immediate relief by using cayenne pepper. Among the advertised patent medicines is a pill the ac-

tive constituent of which is cayenne. Great relief and temporary comfort are commonly obtained by using it as a "dinner pill." If thus used only as a temporary remedy for an acute, and temporary, or exceptional attack of indigestion, all is well; but the cayenne, whether taken in pills or dusted over the food, or stewed with it in curries or otherwise, is one of the most cruel of slow poisons when taken habitually. Thousands of poor wretches are crawling miserably toward their graves, the victims of the multitude of maladies of both mind and body that are connected with chronic incurable dyspepsia, all brought about by the habitual use of cayenne and its condimental cousins. The usual history of these victims is that they began by over feeding, took the condiment to force the stomach to do more than its healthful amount of work, using but a little at first. The stomach became tolerant of this little and demanded more; then more, and more, and more, until at last the inflammation, ulceration, and torpidity, and finally the death of the digestive powers, accompanied with all the long train of miseries to which we have referred.—Knowledge.

DEATH BY DROWNING.—We have never seen this matter more tersely described than in the following words: After a person is below the surface long enough, he fills his lungs with water. The first stage of deep inspiration lasts about ten seconds, followed by a reaction caused by the resistance to the entrance of water into the bronchiales. This is followed by arrest of respiration and loss of consciousness. In a few seconds more he makes four or five respiratory efforts and then dies. Immersion causes an immediate rise in the blood pressure with slowing of the heart-beats. The action of the heart remains slow but strong, till death ensues. The pressure gradually lessens, but rises just before death, to fall to zero immediately afterward. The heart continues to beat feebly for 20 minutes in some cases. The period of respiratory resistance is therefore due to the respiratory muscles and not to spasms of the glottis.

LEPROSY IN NEW BRUNSWICK.—This dreaded disease is rapidly spreading itself over this country and the British Provinces. There has not possibly been a day for many years when there was not one or more cases of leprosy in San Francisco. It is found constantly or at intervals in nearly all our large cities. At the present moment there are 17 leprosy patients confined in the lazaretto at Tracadie, New Brunswick—eight males and nine females. During the past year three deaths occurred from the disease, while one escaped to the United States, where probably the seeds of the disease may be sown to raise up a colony of these unfortunate beings.

RELATIVE SIZE OF THE HEART.—The London Standard gives an account of a German doctor's investigation as to the size of men's and women's hearts. The masculine heart weighs more and is larger than that possessed by the fair sex. A heart, it would appear, grows most quickly during the first and second years of life, and between the second and seventh years it doubles in size. Until after the 50th birthday the heart still grows a little. In childhood the male and female heart are the same size; but after manhood the masculine heart develops much more than the female, and ends by being two square inches larger than the latter.

GROWTH OF THE BRAIN.—The human brain reaches its greatest size between the ages of 14 and 20 in both sexes; after that it grows continually smaller, but increases in weight, through life. While intelligence is rapidly increasing from 20 to 60 years of age, the brain is diminishing in size, but increasing in weight. The time that a man knows most is from 70 to 80; but then his brain is smaller than when he was a boy between 7 and 14, the age when he thought he knew the most. The weight of the brain in man or woman is the test of the capacity for intelligence, not the size.

A NEW REMEDY FOR SEASICKNESS.—Dr. W. H. Gardner, United States army, reports having treated many cases of seasickness with oxalate of cerium, in 10, 15 or 20 grain doses, every two or three hours. He believes that 75 per cent of all cases that occur will be cured by this remedy. As oxalate of cerium is a recognized drug to be administered in cases of nausea and vomiting, there is no reason why it should not be efficacious in seasickness.

A NEW OPIATE.—A German professor has discovered a new opiate which he calls "eufonal." It belongs to the group of the so-called diemphates. It has the property of inducing sleep in invalids, particularly in nervous people and those affected with heart disease, but not in healthy subjects. It is declared to be harmless and a certain means of causing slumber.

STOOPING FORWARD.—The London Lancet says: If the apparently small matter of stooping forward were generally understood, there would be fewer head and heart troubles, and we will go so far as to say that some lives now lost would have been saved.

PARALDEHYDE is a new sleep-producer. Its action is quicker than chloral, it is as safe as the bromides, and is not injurious, except when used to excess.

Telegraph Lines and the Interstate Commission.

A very important bill, designed to prevent unjust discriminations, and to secure equal privileges for all persons and parties in regard to telegraphic service, having previously passed the House of Representatives, has finally passed the U. S. Senate.

The first section of the bill provides that all railroad and telegraph companies which have received Government aid in the construction of their lines, either by loans or land grants, and which, by the act of incorporation, or subsequent amendatory acts, are required to construct, maintain or operate telegraph lines, and all companies engaged in operating said railroad or telegraph lines "shall forthwith and henceforward, by and through their own respective corporate officers and employees, maintain and operate for railroad, Government, commercial, and all other purposes, telegraph lines, and exercise by themselves alone all the telegraph franchises conferred upon them and obligations assumed by them under the acts making the grant as aforesaid."

The second section requires all such subsidized companies to allow any and every telegraph company which has complied with certain legal provisions to connect its line with theirs at any of their stations or offices where their lines may meet, "for the prompt and convenient interchange of telegraph business between said companies, and such railroad or telegraph companies referred to in the first section of this Act shall so operate their respective telegraph lines as to afford equal facilities to all, without discrimination in favor or against any person, company or corporation whatever, and shall receive, deliver and exchange business with connecting telegraph lines on equal terms, and affording equal facilities and without discrimination with or against any such connecting line, and such exchange of business shall be on terms just and equitable."

In case any such company, or company operating such a railroad or telegraph line, refuses or fails to comply with the provisions of the first and second sections, then any person or company may apply for relief to the Interstate Commerce Commission, whose duty it shall be forthwith to investigate the case, determine what is right therein, notify the parties concerned, and, if need be, enforce the order by writ of mandamus in the U. S. Courts. And the commission may institute any such inquiry at their own motion, just as if complaint had been made.

The Statue to Master Mechanic Stevens.

At a meeting of the Executive Committee of the A. J. Stevens Statue Association last week, it was agreed to commence soliciting subscriptions July 23d.

Meetings of the Executive Board are to be hereafter held on the first Friday after the first Monday in each month. The secretary was instructed to invite the employees in the freight shed, chief clerks, and Fourth-and-Townsend street offices to unite with them and appoint a committee to solicit subscriptions from their respective divisions.

Following is the circular sent out:

To the Employees of the S. P. R. R. and C. P. R. R.:—GENTLEMEN: As was promised in the circular addressed to you last month, a mass meeting of those interested in the erection of a statue to the memory of our late Master Mechanic, A. J. Stevens, was called and an association formed with the following officers: President, E. B. Hussey; Vice-President, W. B. Oldfield; Recording Secretary, Walter Van Guilder; Financial Secretary, James E. Camp; Finance Committee, J. H. Ferguson, Thomas Warmby, F. Gaschlin, John West and Thomas Sweeney; Executive Committee, Charles Joy, Charles Pritchard, W. G. Cox, Ben Miller, J. F. Carter, E. D. Chapman, Edward Payne, John Hansman, P. Sullivan, M. J. Burke, I. R. Taylor, James Stewart, Frank Van Gilder, W. B. Hunt, Henry Fisher, F. W. Golden, Wm. Smith, Frank Billings, M. J. Scanlin, and Thomas Fraser, Jr.

It has been decided in joint committee to take up subscriptions at such sums per month as subscribers may deem proper, and continue such monthly subscriptions for ten consecutive months, payment to be made to the member of the Executive Committee representing the department in which the subscriber is employed. It will be necessary to raise at least \$5,000, and it will be seen at once that in order to raise that amount, it will be necessary for every man to be as liberal as possible. Let us show to the world that we are workmenmen are appreciative and liberal, and that we are capable of carrying out a great and noble undertaking. Let us by our appreciation attract the attention and thoughts of our people to the fact that a mechanic can, if he will, rise to the level of the world's benefactors and deserve and receive the highest tribute paid our honored dead.

Mr. — will call upon you for your subscription. Hoping you may accord him a cordial reception and find it in your power to subscribe liberally, we remain, yours in the good cause,

E. B. HUSSEY, Pres.,
W. B. OLDFIELD, Vice-Pres.
WALTER VAN GUILDER, R. S.
JAMES E. CAMP, F. S.

The Skeena river revolt continues to cause great excitement in the Northwest. The local militia at Winnipeg is prepared to start for scene of the outbreak on short notice.

TABLE OF CONTENTS.

EDITORIALS.—New Appliances for Working Gravel Deposits; Exchequer Mining Camp, 69. Passing Events; The English in Mining; New Ore Concentrator, 76. The Miner's Inch; An Unfortunate Strike, 77. The Value of the Lumber Product; Master Mechanics' Association—Locomotive Construction; The Production and Uses of Borax, 78.

ILLUSTRATIONS.—Press Tank Used in Russell Process; Cashier Mine, Exchequer District, 69. Construction of Triangular Weirs, 77.

CORRESPONDENCE.—From the Comstock; Placer County Mines; Mining in Nevada County; The Niehart District, Montana, 70.

MISCELLANEOUS.—The Water Power at Folsom; The Hidden Treasure Mine Fire, 70. The Russell Process, 71. Telegraph Lines and the Interstate Commission; The Statue to Master Mechanic Stevens, 75. **MECHANICAL PROGRESS.**—Forging by Pressure or by Blows; Pulverized Fuel; Novel Experiment with Leather Belts; Rusting of Sheet Iron; Wire Gauges; Oil of Mustard as a Lubricating Oil; Iron in Washington Territory; Malleable Bronze, 74.

SCIENTIFIC PROGRESS.—The Sound of Thunder; How Spectrum Analysis Was Discovered; A Rival for Mount Hamilton; A Scientific School for Siberia; How Leaves Change their Color in Autumn; Iodine of Mercury in Tanning Skins; Are White Animals Specially Induced to Deafness; A Rule of Doubtful Value; An Ancient Foundation, 74.

USEFUL INFORMATION.—How Water Should be Cooked; What a Chinook Wind is; The Good Whet Stone; Castor Oil for Drawing Wire; How to Keep Afloat; A New Car Heater, 75.

GOOD HEALTH.—Impaired Sight of Ironworkers; Ivy and Oak Poison; Condiments and Indigestion; Death by Drowning; Leprosy in New Brunswick; Relative Size of the Heart; Growth of the Brain; A New Remedy for Seasickness; A New Opiate; Stopping Fools, 75.

SHOP NOTES.—A Tool for Under Planing; Keeping Tools; Oiling Steel a Lusterless Polish; Grinding Twist Drills; Water Cooler; The Detection of Hot Bearings; Handy Mixture for a Machine Shop; Secure the Loose Joints; How to Use Babbit Metals, 79.

STEAM BOILER NOTES.—Advantages and Disadvantages of the Surface Condenser; Proportions of Locomotive Boiler and Engine, 79. Throttling the Steam Supply; Proper Thickness for Boiler Plates; Engine Foundations; A Long Run by a Steam Engine; Sensible and Sound; Cornet is not Needed; Economical Press; Increase Working Pressure in Marine Engines, 80.

OUR LUMBER INTERESTS.—The Donahue Railroad Extension; Device for Handling Lumber; Lumbering in California, 80.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 72-78.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 84.

Business Announcements.

[NEW THIS ISSUE.]

Books—C. A. Stetefeldt, New York.
Gold Mine—J. B. Bainbridge, Pasadena, Cal.
Civil and Sanitary Engineer—Hy. Jackson.
Mining Engineer—Modest Maryanski.

Passing Events.

The reduction in the price of lumber which has been announced will stimulate the building industry again. Lumber has been so high of late that many persons have been deterred from building. Coasting freights have fallen, and there is now an abundant supply of lumber.

The experiment of mining the bed of the Carson river by means of dredges will soon commence. A large Webber centrifugal pump has been shipped to the Dredging Co., completing the machinery for the dredge. They expect to begin work by the 1st of September.

The coal resource of Alaska are attracting

attention. A vessel has been chartered in this city and will soon leave with miners and tools, to properly develop the mine. About 150 tons of coal are now ready for shipment.

It is stated that the U. S. Attorney General will enter proceedings against every hydraulic mine which maintains pipes and monitors, whether used or not. The object is to enforce the decisions of the courts and cause a complete dismantlement of the mines. The removal of pipes and monitors is to be regarded as prima facie evidence of intent to comply with the law. It remains to be seen whether the U. S. has any control over the machinery of a mine as well as of a mine itself.

The English in Mining.

There exists just now great business stagnation throughout all parts of Great Britain. The complaint of dull times is universal and goes to all her leading industries; agriculture, manufactures, trade, commerce, all are depressed to an unwelcome degree. Even her coal and iron interests are suffering severely. With affairs at such low ebb many will wonder how it is these people have always money to invest in any promising enterprise, more especially in mining. If their lands and shops and factories and so many of their other home industries are affording them such scanty profits, whence, it is natural to inquire, come the revenues that keep their private coffers always full and their public credit always at par? It is, we opine, the income they derive from their foreign mining ventures that enables the English to invest so largely and so readily in the innumerable schemes that are brought to their notice. This constitutes, no doubt, the principal source of their large ready means and great financial strength. The extent to which they have embarked their means in this business would surprise those who have not had special information on the subject.

There occurs hardly a mineral or metallic product in nature but what this energetic, money-seeking race have made the object of their enterprise, nor is there a land under the sun in which they have not sought after these forms of wealth. In every hemisphere and under every zone English companies are to be found opening up and working mines, the English expert being there also searching after others wherever paying deposits have been met with. Nearly all the rich and well-to-do in that country pay more or less attention to mining, London being the grand center of all this energy, enterprise and far-extended operations. No matter where the property is situated or where a majority of the shareholders may happen to live, there is located the chief office and there do most of the directors reside. To London comes the bullion from the gold and silver mines, and thither all reports are sent. The mails are heavily freighted with these messages from far-off lands, the ocean cables transmitting the more urgent and important. Much profitable business do the latter derive from this source. The number of these mining companies having their headquarters in the great metropolis exceeds belief, their nominal capital actually amounting to billions.

While a great many of these ventures prove disappointing, not a few ending in early and total failure, enough succeed to make the business fairly profitable. Formerly, and for a good while at first, the losses sustained were much greater than they have been for some time past, English experience having in this respect accorded with the rule elsewhere general. It is not so easy now to float on the English market a worthless mine, or even one of dubious value, as it was 10 or 15 years ago. No offering will be touched, though in the hands of the most influential promoters, unless it show substantial merit, these British investors having become very wary and discriminating of late. While a deserving property can be readily placed over there, it would be easier, probably, to handle one of the wild-cat order in this country than in any of the larger cities of England or Continental Europe.

As regards home management, the English have always conducted this department of mining affairs in a more sensible and business-like way than has been common with us. British shareholders are accustomed to give much personal attention to the business. They largely attend all meetings of the companies in which they are interested and take an active part in

the proceedings. After the annual report of the company has been submitted to the meeting, it is carefully considered and is apt to be much discussed before being adopted, shareholders being in the habit of asking the chairman questions concerning matters about which they are ignorant or in doubt. At these meetings every man expresses his mind freely, the management being sometimes very sharply criticised. But everything is conducted with order and decorum, nothing of a rancorous or grossly personal kind ever being indulged in. In these discussions, though they often wax very animated, little ever occurs calculated to mar the amenities of debate. The proceedings of these meetings, or a very full synopsis of them, appear in all the leading mining journals, whereby both the shareholders and the general public are kept well informed in regard to the affairs of these mining companies.

It is no doubt to their mining ventures and the care with which they look after them that British investors are mainly indebted for their seemingly inexhaustible store of wealth and their sound financial standing; and to this industry would the English people do well to hark back themselves even more largely than they yet have done in this, the hour of their industrial and commercial decadence. This sturdy and indomitable race with such a training school as their island affords can continue to reach out and gather in the mineral products of every country and thus go on enriching themselves, even while the other sources of their prosperity and power are being dried up. If there is salvation for failing England, it lies manifestly in this direction. Here the growing manufacturers of other nations will not much affect her, this being a field in which she can employ her skill, energy and capital to great advantage, and in which she will have nothing to fear from overproduction or competition. That a people so sagacious will not be long in discovering this fact, nor slow in availing themselves of these outlying opportunities to recuperate their waning strength, may well be believed.

Mining Bureau Contributions.

Among recent additions to the museum of the California State Mining Bureau are the following:

Liroconite, Cornwall, Eng.; eudialite, Greenland; conellite, Cornwall; pucherite, Saxony; prelesmit, Tyrol; baryto-calcite, England; mimetite, England; condurrite, Cornwall; melphanite, Norway; gyrolite, Greenland; brewsterite, Scotland; brackehuschite, Argentine Republic; triplite, Bohemia; quartz crystal, enclosing limonite, Wales; chrysoberyl, Ural mountains; glaucodot, Chili; rhodocrosite, Colorado; millerite, Pennsylvania; triphylite, Maine; axinite, France; samarskite, North Carolina; pyromorphite, Germany; cronstedite, Cornwall; white tourmaline, Elba; diopside, Serbia; realgar (crystallized), Hungary; natrolite, Ireland; anataxe, Switzerland; corundum (crystal), India; aragonite (crystals), Herrensgrund; pyromorphite, Germany.

Quinnahar from Santa Rosa, on the line between the States of Morelos and Mexico, Mexico, the first mine worked for quicksilver in America, opened in 1718, J. W. C. Maxwell.

Livingstonite (sulph-antimonide of mercury), Trinidad mine, Huizucoc, State of Guerrero, Mexico, J. W. C. Maxwell.

Salt pure enough for domestic use as found, Tehachapi, Summit valley, Kern county, Cal., Judge P. D. Green.

Five specimens Eastern minerals from M. Braverman, Visalia.

Copper ore, Lower California, Geo. E. Mills.

Silver ore of very complex nature, Elko, Nevada, J. W. McDonald.

Fine red sandstone from the quarries of the Arizona Sandstone Co., Chino, A. T., of which the courthouse at Los Angeles is built, W. H. English.

The Arizona Apaches are getting restive, and there are fears of an outbreak. It is probable that if the Indians go on another raid it will be their last one, for the residents of Arizona will not be satisfied with any foolishness, but will insist on the removal of all Indians that are left to some other region.

PROF. C. M. WOODWARD delivered the first lecture at the Cogswell Polytechnic Institute, on the subject of "Industrial Education." The institute will soon be formally opened.

VALENTINE EICHEL, a miner well known in Arizona, was terribly injured by a fall down the shaft of the Topaz mine at Tombstone last week.

SISKIYOU COUNTY has large areas of unprospected and undeveloped mineral land.

New Ore Concentrator.

Frank B. Morse, a mining superintendent of Murphy's, Calaveras county, has just received through the MINING AND SCIENTIFIC PRESS Patent Agency a patent for an improvement in concentrators. The improvement is applied to that class of concentrators such as the Frue and Triumph, in which an endless belt is employed and to which a positive shaking motion is imparted.

The invention is applicable to any of the endless-belt concentrators. These machines differ from one another in details of construction relative to the framework and mechanism for imparting to the belt its several motions, but they all resemble one another in the employment of a common feature—the endless traveling belt to which a positive shake is imparted.

These belts have been made of canvas, especially the earlier ones, but they are now usually made of rubber. The sides have guard flanges and their surfaces are smooth. They are set at a slight inclination and have an uphill travel, at the same time receiving a shake motion either sideways, endwise or an eccentric movement resulting from a combination of single movements.

The general operation is that the stream of water flowing down the inclined belt carries the lighter or waste particles of the pulp with it to the lower end, while the heavier particles or sulphurets cling to the belt and proceed upwardly with its travel against the flow of water, pass around the upper end and are deposited in the tank below.

Instead of using the ordinary belt with the flat or smooth surface, Mr. Morse uses one with a surface consisting of a continuous series of short vanning surfaces, rising at a considerable angle to the horizon and to the general grade of the belt. These elevated vanning surfaces are connected by a series of steep inclined surfaces. This construction changes the vanning surface of the belt from a downwardly sloping surface, as in a smooth belt, to a partially upwardly sloping surface.

The water and pulp flow down the depressed surfaces and are forced up and over the elevated surfaces, and over these latter surfaces the separation of the lighter particles takes place. On a plane-surfaced belt the separation depends largely on the adhesion of the heavier particles to the belt; but, by having the vanning surfaces elevated, Mr. Morse claims there is, in addition to the adhesion, a separation due to the difference of specific gravity of the particles in a current of water. The current of water flowing up the inclined elevated surfaces will take the light stuff, while the heavier stuff will move down through this current and lodge in the angles between the inclined and depressed surfaces. The belt is really formed into a series of riffles which are shaped like an inverted V, with one angle considerably longer than the other. Mr. Morse is of the opinion that a belt made this way can be made shorter than the ordinary ones to accomplish the result. It will also work with a thin stream of pulp. A larger stream of water can be used and any variation in the amount of pulp may be permitted.

THE Mechanics' Fair opens in this city on August 7th, and if we are to judge by interview with the Fair officials, it will be the finest yet, there being an unprecedented demand for space. A new annex 250 feet by 50 feet has been built for agricultural implements, so that now about all the machinery will be outside the main building.

MINERALS IN CHINA.—There is no question but that China is exceedingly rich in minerals—both useful and precious. In many districts the roofs of the houses are covered with copper tiles. A late English paper records the fact that a shipment of several thousand copper roofing tiles was recently received in London from China.

At a special meeting of the stockholders of the Eureka Con. Mining Company, D. Friederich was elected director, vice H. R. P. Hutton, and H. P. Bush, secretary, vice Cunningham, resigned.

At Quijota district, Arizona, last week, the thermometer marked 115 degrees in the shade, and it was very hot in the mines there.

THE Federal Government will enforce a strict observance of the hydraulic mining laws.

The Miner's Inch.

How to Determine Quantity of Water.

In California the measurement of water is by what is known as "miner's inches," but, unfortunately, there is no standard of exactness.

Mr. Aug. J. Bowie, in his work on "Hydraulic Mining in California," in speaking of this subject, says: The miner's inch of water is a quantity which varies in almost every district in California; no one gauge has been uniformly adopted, nor has any established pressure been agreed on under which the water shall be measured. In some counties there are 10, 11, or 12 hour inches, and in others there is a 24 hour inch. The apertures through which the water is measured are generally rectangular, but very greatly in width and length, being from 1 inch to 12 inches wide, and from a few inches to several feet long. The discharges are through 1-inch, 1½-inch, 2-inch, and 3 inch planks with square, or with square and chamfered edges, combined or not, as the case may be. The bottom of the opening are sometimes flush with the bottoms of the boxes, sometimes raised above them. The head may denote the distance above the center of the aperture, or again that above the top, and varies from 4½ inches to 12 inches above the center of the aperture.

The Smartsville inch is calculated from a discharge through a four-inch orifice with a seven-inch head; that is to say, the head is seven

the sea-level. The *module* used was a rectangular slit 50 inches long and two inches wide, with head seven inches above the center of the opening. The discharge was over a three-inch plank, the outer inch chamfered, as shown in accompanying engraving. The size of the opening was taken with a measure (micrometer attached) which had been compared with and adjusted to a standard United States yard. Time was read to one-fifth of a second; the level of the water (drawn from a large reservoir) was determined with Ryden's book, micrometer adjustment. The following results were obtained:

One miner's inch will discharge in 1 second .026 cubic feet; 1 minute, 1.57 cubic feet; 1 hour, 94.2 cubic feet; 24 hours, 2260 S cubic feet.

The coefficient of efflux was 61.6 per cent. These figures are within the limit of 1-500 possible error. The experiments were made by H. Smith, Jr., C. E.

As the two-inch aperture requires too much space for gauging large quantities of water, custom has changed the form of the meter, and an aperture 12 inches high by 12½ inches wide, through one and one-half inch plank, with a head of six inches above the top of the discharge, is now used. These openings discharge what is counted as 200 miner's inches.

A series of experiments was made by Mr. Aug. J. Bowie at LaGrange, Stanislaus county, California, latitudes $37^{\circ} 41' N.$, elevation 216

Van Nostrand of New York) engravings which we here reproduce showing how to determine the discharge through triangular notch. The method described by him is as follows:

Discharge Through Triangular Notches.

The right angled triangular notch of thin sheet iron is a very convenient way of measuring the discharge of water. According to Prof. Thompson's experiments, the discharge in cubic feet per second = head^{3/2} (in inches) x 0.0051.

To use the notch, construct a weir box, *O*, with a notch, *Y*, (see cuts), made of iron, fitted in one end. The edges of the notch must be sharp and beveled out, and the inside face must be placed at right angles to the surface of the water, *M*. Place in the box bolls-boards or strips, *KK*, to render the surface of the water near the point *A* uniform or still (*A* is taken about 18 to 24 inches back from the weirs-plats *Y*). Place a spirit-level or straight-edge, *C*, on the weir-plats at *E*; measure the distance at *A* from *H* to surface of water. Subtract this from *C*, and find the difference in column marked *h* of accompanying table. Opposite *h*, in column *Q*, will be found the number of cubic feet of water flowing over the notch in one minute.

DISCHARGE OF WATER THROUGH A RIGHT-ANGLED TRIANGULAR NOTCH.

1 cubic foot = 7.48 U. S. gal.; 1 U. S. gal. = 8.34 lbs.

The legal definition of a miner's inch (see Water Rights, State of California, Civil Code, Section 1415) is that quantity of water which will flow through an opening of one square inch in the bottom or side of a vessel, under a pressure of four inches above an opening. Fifty of these miner's inches is equivalent to a discharge of one cubic foot of water per second, and is less by .312 of a cubic foot per second than the "Nevada county miner's inch." To get the number of gallons in miner's inches, multiply the given number of inches by 14.961, pointing off five decimal places; the result gives the number of gallons discharged per second. To get miner's inches in gallons, divide the number of gallons, flow or discharge per second, by 8.9766; result will be number of miner's inches sought.

The following table from the *Statistician* gives

the water measurement in the State of California by 11 different ditch companies, legal measurement of the State included:

NAME OF DITCH (COMPANY, ETC.)	OPENING		Through 4 Planks Inches.	HEAD-UP BOARD		Gable feet per cu. yd.

An Unfortunate Strike.

There is no intelligent, well-disposed man who does not entertain a very great respect for the National Association of the Brotherhood of Locomotive Engineers. It has long been regarded as one of the most intelligent and conservative of all the labor organizations of the country, and it has been a matter of much regret everywhere that such an organization should have been betrayed into the unjust and unnecessary "B. & Q." strike, which has so long interfered with the general business interests of the Union, both East and West. Especially has this been the case since the startling developments have been made in Chicago which have involved several of the members of the association in a deep, widespread and most criminal conspiracy, in which the lives of great numbers of innocent persons—men, women and children—were involved. The testimony, elicited by the open confession of two of the leaders, shows a long-existing plot of a most dangerous and desperate character. No well-informed man would for a moment think of holding the association responsible for such a criminal act, but the public cannot close their eyes to the fact that the conspiracy has grown out of most unlawful and violent demonstrations for which the Brotherhood is directly responsible.

The strike has long been practically a failure, and there is no possible hope for any other result—in the nature of things there cannot be. Hence, for the sake of the general public and all concerned, would it not be well for the Brotherhood to officially accept the actual situation and declare the strike off? A prompt act of that kind would help the credit of the association and put a stop to any further criminal attempts against persons or property. Mr. Arthur, the head of the organization, is said to be in favor of such a course, which, under present circumstances, would give evidence that the methods of the Brotherhood are legitimate and law-abiding.

There can be no possible contingency under which the least excuse exists for any attempt to right a wrong which must involve in its consequences the lives of innocent women and children. There must be no excuse for dynamiters anywhere; the full force of the law should be meted out to them. The dynamiters connected with the railroad strike in this city a year ago made it impossible for that movement to result in success. So it will and should be everywhere.

THE RAILROAD IN TURKEY.—The railroad has found its way into Turkey and threatens such a revolution among the Turks that they would stop its progress if they dared to do so. But there is too much enlightenment even in that benighted land to rule it out. The car of progress cannot be stayed in its course, notwithstanding it threatens dire calamities to the Sultan's gates and rule. The only safeguard of despotism is comparative ignorance and isolation.

DISCHARGE OVER THREE-
INCH PLANKS.

CONSTRUCTION OF TRIANGULAR WEIRS.

inches above the opening, or nine inches above the center. The bottom of the apertures is on a level with the bottom of the box, and the board which regulates the pressure is a plank one inch thick and seven inches deep. Thus an opening 250 inches long and four inches wide, with a pressure of seven inches above the top of the orifice, will discharge 1000 Smartsville miner's inches. Each square inch of the opening will discharge 1.76 cubic feet per minute, which approximates the discharge per inch of a two-inch orifice through a three-inch plank, with a head of nine inches above the center of the opening, the said discharge being 1.78 cubic feet per minute. The Smartsville miner's inch will discharge 2534.40 cubic feet in 24 hours, though in that district the inch is reckoned for 11 hours only.

The miner's inch of the Park Canal and Mining Company, in El Dorado county, discharges 1.39 cubic feet of water per minute. The inch of the South Yuba Canal Company is computed from a discharge through a two-inch aperture, over a 1½-inch plank, with a head of six inches above the center of the orifice.

At the North Bloomfield, Milton and La Grange mines the inch has been calculated from a discharge through an opening 50 inches long and two inches wide, through a three-inch plank (outer inoh chamfered) with the water seven inches above the center of the opening.

Experiments at Columbia Hill.
To determine the value of this miner's inch, a series of experiments was made at Columbia hill, latitude 39° N., elevation 2900 feet above

feet above the level of the sea, to determine the value of the inch thus delivered in the claims. The results here given are the mean of a series of gaugings taken from nine different apertures, discharging in the aggregate 1800 miner's inches.

The water was drawn directly from a flume and discharged into a small reservoir, across the lower end of which was fitted a gauge. The velocity of the water issuing from the flume was broken by several drops as it entered the reservoir, and the gauge at the lower end was raised sufficiently to prevent any flow due to an increased velocity which might have been acquired in the flume.

The level of the water was determined with a Boyden's hook.

The discharge from the module was caught in a flume and conducted to a box fitted and leveled for the purpose. Time was read to one-fifth of a second. The following results were obtained :

One miner's inch discharged in one second .02499 cubic feet; in one minute, 1.4994 cubic feet; in one hour, 89.9640 cubic feet; in 24 hours, 2159.1460 cubic feet. Effective coefficient of efflux, 59.05 per cent.

An experiment on a single aperture of this form, made by Hamilton Smith, Jr., gave a discharge of 2179 4 cubic feet per miner's inch in 24 hours. The 2230 cubic feet of the North Bloomfield inch can only be considered an assumed rough estimate of discharge in 24 hours for one miner's inch.

Mr. Bowie gives in his book (published by

The Value of the Lumber Product.

Very few people, we opine, have any adequate idea of the importance of the lumber interest of the country, or of its value as compared with our other leading industries. We append a few figures compiled by the Bureau of Statistics at Washington of the various products of the year 1883:

Forestry.....	Value.....
Corn.....	\$700,000,000
Wheat.....	679,713,499
Hay.....	474,291,850
Cotton.....	371,811,084
Oats.....	280,266,242
Gold and silver.....	160,243,565
Coal of all kind (tons).....	174,400,000
Iron ore.....	194,500,000
	29,470,000

Corn is frequently alluded to as the most important agricultural product of the country, and the one of the greatest value; but in 1883 the lumber output exceeded in value the corn crop by nearly \$21,000,000! At the present time, without doubt, the excess in value of the lumber output is much greater than in 1883, and far more rapidly increasing. In connection with the above we append the following further interesting facts about lumber:

To the great Northwest, within the last two decades, millions of dollars have been sent for investment; miles of railroad have been built; hundreds of families have moved there and made homes—and yet, in a climate far more hospitable, in a section of country not nearly so isolated and so sterile, some of the finest timber lands, hard wood and pine, have gone begging at \$3 an acre! The census is not an interesting reading matter to most people, but it is instructive, nevertheless. From it we learn that in 1880 there were 259,959,159 acres of forest land in the Southern States—more than the total improved land in farms in all the States in the Union, leaving out Illinois. It is safe to say that 80 per centum of these 259,959,159 acres is in virgin timber. Two hundred millions acres of woodland! There are, in the Northern States and Alaska, about 180,000,000 acres, so we lead the North by 20,000,000 acres—and Alaska will not be a lumbering country for many a year yet, it is to be presumed.

In 1880 the South produced about \$45,000,000 of sawed lumber, which was not a bad showing when it is remembered that the machinery up to that time was exceedingly primitive. The next census will show an increase that will astonish every one. The sawmills in the South are run by mechanics—by men from Indiana, Ohio and other timbered States, and they have a keen knowledge of the business and know just what they are doing. They have the best circular and hand sawmills to be found in this country. There are more hand sawmills south of the Ohio than there are north of it. They out to the best advantage and shape the lumber as wanted. Sawmilling in the South is in its infancy, but strong enough to stand alone. The timber is cheap, of fine quality, and can be bought in any quantity wanted.

Master Mechanics' Association—Locomotive Construction.

The American Master Mechanics' Association held its annual meeting at Alexandria Bay in June. The work of this association is largely one of education. Much of the time of the association was taken up in discussing the subject of locomotive construction and management, a business in which improvement can be realized only by the most tentative processes and at the expense of much observation and patience. "Standards in locomotive construction," says a mechanical contemporary, "can only be satisfactorily established as a result of careful and extended observation, made by many men, and under a great variety of conditions which indirectly affect the results. It follows that conclusions must be drawn after mature consideration, or they will be worthless. The master mechanics are wise in proceeding with caution in this respect. A step backward will halve a dozen steps forward. The association cannot afford to go backward. To do so would, in every instance, seriously impair its usefulness. The association is working along slowly in the adoption of standards; those who think greater speed should be made in this direction can hardly have studied the question closely.

The American Machinist, in alluding to the meeting of the association, says: "Locomotives are worked in different parts of the country under widely different conditions, and it is a serious matter to adopt any single detail that shall fit all these conditions, or shall be a satisfactory compromise. The opinions expressed in the replies to the queries of committees appointed to investigate different subjects, and the discussion of the reports of these committees, show what wide difference there is in the experience of dif-

ferent men, who have, presumably, carefully made investigations. Of course this difference of opinion is generally due to the influence of something extraneous, but this does not make the task of getting at exact fact; upon which to build any the less easy of accomplishment. Those who have devoted much time to experiment know how difficult it is to eliminate those things that have a real but not desired connection with the question under consideration. In locomotive operation it is practically impossible to make all the conditions, save one, uniform; hence the difficulty of correct observation."

UNNECESSARY DESTRUCTION OF SALMON IN ALASKA.—We learn from Mr. Jonathan K. Hoag, who arrived in this port on Saturday last per steamer Dora from Alaska, that it is the custom at the salmon fisheries at Kodiak, and presumably at other places in Alaska, to place boards entirely across the streams in such a manner that the salmon cannot pass them on their way up the stream to spawn. The streams thus become literally filled with fish, which, in their frantic efforts to pass the obstruction, butt their heads against it until their noses or the side of the head is so worn off that the fish die. In most of the catches great numbers of fish are also so injured that they become useless for canning. In these ways nearly as many fish are wasted as are saved. Such a practice, besides being unnecessarily destructive to the fish, is barbarous in the extreme and calls loudly for some fish law which shall properly protect the fisheries of that Territory. We understand that the fish are already getting scarce in some localities in the Territory from wanton destruction and unnecessary interference with the progress of a reasonable number of fish to their spawning-grounds.

PACIFIC FISHING RESOURCES.—The fishing resources of the Pacific Coast are being rapidly extended. In addition to salmon, codfish and other largely utilized varieties, that large and delicious fish, the halibut, is now found in great abundance. The Gloucester halibut fishers are making arrangements to put vessels in the business on this coast, and send fresh halibut by fast freight to the East. The growing scarcity of this fish in the Atlantic, and its great abundance in the Pacific, will render such a business profitable. The abundance of these fish here has just been demonstrated by a catch in 15 days of 50,000 pounds by the Mollie Adams, a schooner which recently arrived here from the Atlantic Coast to go into this business off the coast of British Columbia.

EFFECT OF GLASS UPON WINE.—It has been discovered in France that glass bottles in which wine is kept sometimes affect its quality. Poligot, a chemist, says that the changes which wine kept long in bottles undergoes is due to the action of the ingredients used in the preparation of the glass. An undue admixture of lime and magnesia, which are often substituted for soda and potash, being cheaper, act injuriously upon the wine. In those bottles in which the wine actually improves, the proportion of lime is found not to exceed 18 or 20 per cent.

EXTENT OF DAMAGE TO FRANCE BY PHYLLOXERA.—The phylloxera, since its first appearance in France, 12 years ago, has desolated one-half of all the vineyards in the country. The actual money loss to the country is variously estimated at from one and a half to two thousand millions of dollars! The area actually destroyed is set down at two and one-half millions of acres, with damage to others, still partially productive, of at least half a million more, making an aggregate loss of 3,000,000 acres. And still the work of destruction goes on.

COAL FROM JAPAN.—The American bark Sunbeam recently arrived at this port from Kobe, Japan, bringing a cargo of 1320 tons of coal, consigned to J. D. Spreckels & Bros. This is the first cargo of Japanese coal ever brought to this port. This looks like opening up a new source of coal supply for this city. Japan is well known to be bountifully supplied with this carboniferous mineral.

SAFE AGAINST SHELLS.—It is reported from London that the French authorities, in view of the recent discoveries of explosives, have decided to use metallic casings for fortifications, with a kind of cement called bethunage, against which shells are powerless.

The Production and Uses of Borax.

Borax—borate of soda—was known to the ancient Greeks and Romans as *nitrum*. Its first mention by the alchemists was in the 10th century. Its chemical nature was first made known by Geoffroy in 1732. The common hexagonal crystals of borax, according to Dana, consist of 47.17 of water, 16.25 soda, and 36.58 of boracic acid. It sometimes occurs native in crystals, sometimes in concrete lumps. It is found in various parts of Asia and North and South America. It is mostly produced from the natural product, boracic acid. It was originally brought commercially from a salt lake in Thibet. Pure borax is a white substance of sweet taste, soluble in twice its weight of boiling water. It melts by heat into a porous mass. When at a temperature of redness, it runs together into a transparent glass, called glass of borax.

The refining of crude borax has been conducted in the seaport towns of the Mediterranean from the early times of ancient Greece.

The volcanic regions of Tuscany were for many years the chief source of supply of this product for Europe. That region commenced its supply about 1818. For the first ten years it turned out in the aggregate only about 750 tons; the next ten years the works produced 7000 tons. From that time the product was gradually increased up to 1846, when the annual output was 1500 tons.

The Varying Price of Borax.

About 1848 or '49, much apprehension was felt lest the natural supply of the article should give out. This fear was chiefly induced from the fact that the material from which it was obtained had for several years been becoming less and less productive. The foreign matters which it contained averaged for many years only about eight per cent, but about 1850 those impurities increased to fully 25 per cent. As a consequence of this uncertainty the price was about doubled, and refined borax sold in 1850 as high as 60 cents a pound; but confidence in its yield having been restored, it gradually dropped from that figure to 40 cents in 1857, and 23 to 25 cents in 1859. That figure was quite constantly maintained until 1869, when the California product began to come into the market, upon which the price again began to drop, finally reaching 12 to 15 cents in 1874, and 7 to 8 cents in 1878 and '79. In May, 1887, it dropped to 5 and 6 cents, but is now, July, 1888, quoted at about 9 cents.

Its Production on the Pacific Coast—A New Deposit.

The production of borax on the Pacific Coast is at present confined to California and Nevada. But what is supposed to be a very extensive deposit is about to be opened directly upon the ocean coast in Oregon and about 15 miles north of the California line. This deposit is a somewhat remarkable one, being imbedded in a dry bluish composed largely of blue clay in such a position that small vessels can anchor within less than a mile of the deposit.

The production of borax on the Pacific Coast commenced about 1860. Sixteen years later, in 1876, the yield had increased to a little over 5,000,000 pounds. During the next ten years—up to 1887—the production increased from five to within a fraction of ten million pounds, while the importation into the United States has fallen off to less than 5000 pounds.

In addition to the almost total supply for the United States, the Pacific Coast, in 1886, exported to foreign countries 2,042,012 pounds, of which amount 1,964,283 pounds went to England.

The Early Uses of Borax

Were chiefly confined to metallurgical operations as a flux. In brazing, welding and soldering, it forms a thin, fusible protection to the bright, metallic surfaces which it is desired to unite. It has also long been used as a flux in assaying. It is now largely used in glass manufacture, and to some extent in medicine and the manufacture of gems.

Its Future Uses to be Greatly Enlarged.

The virtues of borax are even yet but comparatively little known to the world, and much study is being made at this time by scientific men for new uses to which, under its present low price, it may be economically applied. In the near future and under the still further reduced prices which will probably be met, a much more extensive consumption than now obtains will undoubtedly be met with.

According to an article which lately appeared in the *Alta* of this city from the pen of Mr. Arthur Robottom, an English gentleman, who has given much careful attention to this matter, Prof. Schnetzler and Mons. Dumas of the Paris Academy of Science have given publicity to various new uses to which borax may be applied. Mr. Robottom himself has also experimented largely in this direction, and now expresses himself as being fully convinced that borax will soon become one of the leading articles of commerce in the States of California and Nevada. The great use of it has been in the manufacture of the glaze on earthenware, but in future it will be used for a thousand purposes—one of the most important will be the washing of linen, calicoes, flannels, and all woolen goods, etc.

Mr. R. says: I have had it tried and thoroughly tested in various work-houses, hospitals, prisons and other public institutions in this country, and in all cases the reports are most favorable. Two ounces hoiled in 12 gallons of water for washing will make clothes cleaner and whiter than soda or washing-powders, and does not injure or rot the material; the colors in print are not the least affected when washed with borax; it saves half the soap, and the best of all, it does not injure the washer woman's hands, but heals any sores. [We have no Chinamen in England to do the washing, as we have in California.] Two ounces of it hoiled in a pint of water (all solutions of it should be hoiled) cleans marble, removes the stains and dirt, and is most useful for cleaning paint, without removing it; cleaning printer's type, jewelry, plate-glass windows, taking stains out of decanters, and for making vegetables beautifully tender and green. A small quantity put into the tea kettle extracts the strength and improves the flavor; mixed with a little camphor, makes a splendid hair-wash; put into the water that barbers use, makes shaving easy; makes bad water good for drinking purposes; removes stains from the hands; kills bugs and destroys the fungus that is so injurious to the vines, and kills the spawn of frogs and other small fry; a small quantity put into milk prevents it going sour; kept air-tight, it will retain the scent of new milk for months. I have hoiled two ounces of borax in a pint of water, placed grapes in the solution when cold; the color is perfect and the grapes are preserved, but the flavor is not equal to fresh-gathered grapes.

Fruit can be preserved in a strong solution of borax, and meat will not putrefy if covered with a dry powder. Some pork pickled with dry borax kept well for more than a month, but was not palatable.

Two ounces of borax will go as far in washing or cleansing as a pound of soda. Borax placed in steam boilers prevents their becoming encrusted. It is used in England to repair millers' grinding-stones, for enameling watch and clock faces, in the manufacture of edge tools, in electro-plating by brisiers, and by hatters in cleaning raw silk, in the fining of metals and enameling iron, and in India for making fine steel. It will cure toothache, preserve the teeth, cure sore throats, is good for rheumatics, makes a cooling drink in hot climates, prevents chilblains, and preserves the most delicate fruits from the tropics.

The work of production is still going on in California, as will be seen from the following for this year up to July 23, 1888: Receipts for January, 479,000 pounds; February, 396,700 pounds; March, 648,000 pounds; April, 623,700 pounds; May, 1,317,700 pounds; June, 957,700 pounds; July, to date, 152,300 pounds. Total, 4,422,800.

IRISH WOOLENS IN AMERICA.—It is said that a syndicate of 14 woolen-mills in Ireland has agents in this country selling the product. The agents say they are competing successfully in this market with the goods of England, Australia and Scotland. The mills are operated by water-power, and they employ 2800 persons, nearly all girls, who receive \$3 a week.

RUSSIAN FLAX.—It is claimed that Russian flax is an improvement over our common American variety; that the seed is more abundant, larger, and yields a larger per cent of oil, and also that the fiber is superior. We know of no instance of its cultivation in this State. Should he pleased to hear from any correspondent in regard to the matter.

The Fraser Wine Process in France.

Most of the Algerian wines, especially those made from vines raised on the lowlands, have a musty or earthy taste, which is very detrimental to the wine and which could not heretofore be got rid of and made ready for use except by allowing the wine to age in cellars for a period of at least two years. As the wine product of Algeria exceeds 50,000,000 gallons annually, the loss of interest on the cost of the wine added to the loss by evaporation represents a very large sum.

M. Julien Pignet of St. Chamond, Loire, France, having become familiar with the Fraser process for aging wine and being duly authorized to do so, determined to try the virtue of that process for the treatment of this kind of wine. Accordingly, on the 1st of April last, M. Pignet put under treatment several varieties of wine as follows: Red Bordeaux wine of 1886, and Burgundy wine of 1886, and two lots of Red Algerian wine—one of the vintage of 1886 and one of the vintage of 1887, which last, of course, could not have been more than about six months from the press. The result was given in his own words as communicated to Dr. Fraser of this city:

"After 25 days' treatment we examined the No. 1 Algerian wine. To my great joy the wine was quite transformed. It had lost the taste of terroir. It was soft and agreeable to the palate, having lost the hardness of new wine; the person who furnished me with the wine imports wine from Algeria. He would not believe that it was possible to ripen and age wine in glass vessels. When he compared the treated wine with that not treated, he was greatly astonished at the result." After a long letter M. Pignet adds the following postscript: "I am pleased to tell you, before posting this letter, that we examined the No. 3 Nevada Algerian wine, and that the success has been as complete as the No. 1. The most important result of these two experiments has been to prove that the bad taste of these Algerian wines disappears completely by the effect of the treatment."

The Merchant of this city, in commenting upon the above, says: "Evidence is accumulating every day of the immense value of Dr. Fraser's discovery. It certainly cannot fail to revolutionize the wine industry of the world, for nobody can afford to keep wine in cellars two or three years and suffer a loss of 20 per cent by evaporation and handling, besides the loss of interest on the cost of the wine, the cost of cooerage and cellars, besides labor and insurance, while by the 'Fraser process' the above losses and expenses can be mostly saved and the wine fitted for sale or use within 30 days."

A Crucial Test in this City.

In connection with the above, we would add the following note from Mr. Thomas Penlington of this city. Mr. P. writes, under date of June 6, 1888, to Dr. Fraser as follows:

Of all the numerous tests to which wines treated by the "Fraser process" have been submitted, one of the most important to my mind was in my own cellar, at 123 O'Farrell street, in this city.

Two tanks containing 105 gallons each were filled with wine on the 26th day of June, 1886. One was filled with Zinfandel claret, and the other with Gutedel white wine, both made by J. H. Drummond, Esq., of Glen Ellen, Sonoma county, of the vintage of 1885. After the wine was under treatment about five weeks, it was put into barrels and kept in the cellar. No attention was paid to it whatever. It was neither racked nor were the barrels filled for a period of 20 months. It was expected that the wine had spoiled, yet upon examination, to my great surprise, both kinds were clear, bright and sound, and possessed the bouquet and flavor of ripe old wines. The barrels had lost by evaporation at least four or five gallons each, consequently lacked that much of being full, yet the wine had kept perfectly under those unfavorable conditions.

On the other hand, the samples of the untreated wines that were kept under equally favorable conditions, had entirely spoiled. This experiment proves very clearly, to my mind, that not only bouquet and flavor are developed by the process, but the wine is preserved against secondary fermentation and a liability to spoil under the most unfavorable conditions.

THOS. PENLINGTON.

San Francisco, June 6, 1888.

The above letter of Mr. Penlington goes to show that the process has the effect to chemically change the nitrogenous substances in the wine so that they become incapable of fermentation or decay. No new wine containing them would fail to spoil if kept a year and eight months in barrels not full, or lacking four or five gallons of being full. This seems to be a very strong point in favor of the "process."

As a still further evidence that the "Fraser process" produces the results above shown, we would state that our attention has been called to the condition of two drinking glasses which were nearly filled with claret wine of the vintage of 1886, and allowed to dry with a covering of thin cloth over them. The two samples were from the same barrel, but one was treated about four weeks by the "process" and the other was not. The bottom of the glass which contained the "treated" sample was covered with a bright, glossy sediment, the odor of which was sweet and pleasant. On the other hand, the bottom of the glass which contained the sample

not treated was rough and covered with a green mold. The smell was like that of decaying vegetable matter.

The power of the "Fraser process" to develop bouquet and flavor in a most wonderful degree has been universally acknowledged, and now the aforesaid tests go to show quite conclusively that it preserves the wine against germs, decomposition and decay.

We are of the opinion that the vast importance of the new discovery to the wine and liquor industries of the world cannot be fully estimated.

SHOP NOTES.

A Tool for Under Planing.

No one who has ever had much planer work to do on the under side of surfaces, such as the projecting parts of lathe beds, which must be planed for the carriage gibs to work on, will fail to appreciate the tool for this purpose devised and used in the Springfield Machine Tool Co.'s shops at Springfield, Ohio. It not only obviates the necessity for standing by and lifting the tool, and bolting it up during each back stroke, which is always a very irksome pastime, but lessens the liability to accidents, and in the end reduces the cost of tools.

The tool consists of a square shank held under the tool clamps of the planer in the ordinary manner, and having its lower end enlarged and a hole bored through it for the reception of a shaft, which, at its outer end, carries the tool.

The shaft is a good working fit in the bar, and is made to turn slightly in it, its motion being limited by a short pin which is driven into the collar of the shaft, and enters the circular slot milled in the side of the bar. When the tool strikes the cut the pin is forced up to the end of the slot, but during the back stroke a small spiral spring inserted in the slot behind the pin allows the shaft to turn back sufficiently to relieve the tool, restoring it to its place again before the next cut commences.

With this tool the clapper can be clamped down, and the work proceed with all the convenience and comfort attending the doing of any other kind of planer work, and without the fear of the tool catching and wrecking something. On account of the tool being so much easier and more simple to forge and grind than the ordinary hook tools used for this kind of work, it will probably prove cheaper in the end to use this new device.

It is made entirely of tool steel for the sake of rigidity, and it would be necessary to have two of them (or at least two bars), one for right and the other for left hand work. But if the projection or nub be left off the side of the bar, and a slot milled in each side, the shaft can be taken out and put in from the opposite side, and it will then work either right or left hand, but this, of course, would shorten the bearing of the shaft in the bar and be at the expense of stiffness, besides being more trouble to rig up.

There are no restrictions upon its use by any one who chooses to make one, and there are many shops where it would pay to make and use them.

KEEPING TOOLS.—Keep your tools bandy and in good condition. This applies everywhere, and in every place, from the smallest shop to the greatest mechanical establishment in the world. Every tool should have its exact place, and should be always kept there when not in use. Having a chest or any receptacle with a lot of tools thrown into it promiscuously, is just as bad as putting the notes into an organ without regard to their proper place. If a man wants a wrench, chisel or hammer, it's somewhere in the box or chest, or somewhere else, and the search begins. Sometimes it is found—perhaps sharp, perhaps dull, maybe broken; and by the time it is found he has spent time enough to pay for several tools of the kind wanted. That habit of throwing every tool down, anyhow, in any way, or any place, is one of the most detestable habits a man can possibly get into. It is only a matter of habit to correct this. Make it an inflexible end of your life to "have a place for everything and everything in its place." It may take a moment more to lay a tool up carefully after using, but the time is more than equalized when you want to use it again, and so it is time saved. Habits, either good or bad, go a long way in their influence on men's lives, and it is far better to establish and firmly maintain a good habit, even though that habit has no special bearing on the moral character; yet all habits have their influence. Keeping tools in good order, and ready for use, is as necessary as keeping them in the proper place. To take up a dull saw, or dull chisel, and try to do any kind of work with it, is worse than pulling a boat with a broom, and it all comes from the same source as throwing down tools carelessly—habit. Nothing more nor less. To say you have no time to sharpen is worse than outright lying, for if you have time to use a dull tool you have time to put it in good order.

—Manufacturer and Builder.

GIVING STEEL A LUSTERLESS POLISH.—A finely polished, lusterless surface on tempered steel can be procured by either of the following operations: After the steel article has been tempered it should be rubbed on a smooth iron surface with some pulverized oil-stone until it is perfectly smooth and even, then

laid upon a sheet of white paper and rubbed back and forth until it acquires a fine dead polish. Any screw-holes or depressions in the steel must be cleaned and polished beforehand with a piece of wood and oil stone. This delicate, lusterless surface is quite sensitive and should be rinsed with pure soft water only. A more durable polish is obtained by first smoothing the steel surface with an iron polish and some powdered oil-stone, carefully washing and rinsing. Then mix in a small vessel some fresh oil and powdered oil-stone, dip into this mixture the end of a piece of silder pith, and polish the steel surface with a gentle pressure, cutting off the end of the pith as it commences to become soiled. In conclusion it should be thoroughly cleaned in soft water, when the article will be found to have a fine, lusterless polish. —Manufacturers' Gazette.

GRINDING TWIST DRILLS.—Twist drills, says the American Machinist, should be ground to such an angle as will give them a straight lip; and this angle varies in different makes of drills, being determined by the shape of the cutter used and the angle of the spiral. A drill which, when ground at one angle, will have a straight lip, will, when ground at another one, have a curved lip, and manufacturers use such a combination of shape of cutter, angle of spiral and angle of lip, as to produce a straight lip. A recent correspondent of the Machinist, Mr. Geo. R. Stetson, says that 31° is assumed as the proper angle, and as Mr. Stetson is the superintendent of the Morse Twist Drill and Machine Co.'s Works, it is to be presumed that their drills have straight lips when ground to that angle. It has been claimed, however, that 29° 30' is the best possible angle. It is probable that the best angle for general purposes is about 30°. But circumstances sometimes change this. For instance, if the holes must be started from a center-punch mark, a drill ground to a much sharper angle will have less tendency to "run," but after it gets fairly started, and especially if it is to encounter hard spots or blow-holes, it will go much straighter if ground quite flat. You will find, however, that most drills are so made that when ground to about the angle we have mentioned, the lips are straight, and for general purposes it is probably best.

WATER COOLER.—One of the very best methods to keep water cool in our warm climate, without ice, was shown a few days ago, while visiting a raisin farm not far from town. The way is an inexpensive one. A common good-sized barrel, without top, was filled with water. This barrel again was set inside a larger sugar barrel, and the space of two inches between the two barrels was filled with coarse wooden shavings. These were kept constantly wet, every one drinking pouring the balance of the water in the cup over the shavings. The water in the inner barrel was next to ice cool, without having that peculiar chill so general and sometimes dangerous in ice-water. We have seen barrels, kegs, stone jars, etc., wrapped with sacks, canvas, blankets, etc., but none of these kept the water as cool, or were as easily kept, as the double barrel described above. We recommend every farmer, vineyardist, or family in town, who cannot afford ice, or live too far from the supply, to try this water-cooler. It will give you satisfaction. —Fresno Examiner.

THE DETECTION OF HOT BEARINGS.—M. Gerhuz, it is stated, has devised an apparatus by which an audible and visible signal is given to the engineer if any part of the machinery to which the apparatus is fitted should become unduly heated. In its simplest form, as applied to the crank pin of a steam engine, the device consists of a small cylinder fastened to and projecting from the crank pin, and containing a plug of easily fusible alloy, which is pressed against the crank pin by a perforated piston and spring. The piston rod, by means of a lever, controls a catch belonging to the mechanism of a bell placed over the apparatus. The gear of the bell, which is actuated by a spring power, is previously wound up by hand and locked by the catch. If the crank pin should become heated, the fusible plug melts, thus allowing the piston to descend, thereby releasing the catch and sounding the bell. In addition to this audible signal, a disk hidden underneath the bell is turned in such a position that a bright color is seen through two holes in the disk of the bell.

HANDY MIXTURE FOR A MACHINE SHOP.—It has been stated that soft soap, with half its weight in pearl ash, one ounce of mixture in about one gallon of boiling water, is found of great practical value in engineers' shops, in the drip pans used for turning long articles bright in wrought iron and steel. The effect of this mode of treatment is that the work, though constantly moist, does not rust, and bright nuts are immersed in it for days till wanted, retaining their polish.

A NEW MACHINE for rapid manufacture of wooden conveyer flights has been designed by Mr. C. L. Redfield, of Redfield & Haherlin, mechanical engineers, Minneapolis, Minn. This machine performs every operation automatically, from receiving the rough strips of wood to dropping out the finished flights. Heretofore this work has been done by six or eight handlings on as many different machines. This machine has recently been put into operation and

delivers the finished flights at the rate of from 20 to 30 per minute. An important advantage of the new machine is that the flights are much better finished than by the old process. As the machine is comparatively small, not likely to get out of order, and requires but one attendant, it seems destined to supersede present methods of manufacturing flights.

SECURE THE LOOSE JOINTS.—Many think that engineers pay too little attention to the necessity of securely fastening the flexible parts in moving machinery that are liable to vibration. Such parts act like a cutting instrument, and eventually wear into each other and into the permanent structure. Not long since a locomotive could be seen, built by a builder of some reputation, where the cab sheet, not being fastened to the boiler, had cut about half-way through the wagon top, almost rendering the boiler dangerous, and yet this locomotive had been built only a few years. The excessive noise about some machinery renders the squeak and noise incident to such wearing unnoticeable. It therefore escapes attention until the damage is done. Often under new engines one can hear strange noises. If the louder noises and sounds about machinery could be silenced, the magnitude of the squeaking and grating sounds would be surprisingly apparent.

NO TWO MEN DO WORK EXACTLY ALIKE; every good workman has ideas of his own, and when he attempts to follow out ideas given by the foreman or some one else, he is pretty sure to make a "botch" of it. General principles are the same, but the details should invariably be left to the workman himself, otherwise he not only loses confidence in himself, but becomes a mere machine which requires constant watching.

HOW TO USE BARBITT METAL.—Caution is given in an exchange against filling a box with barbit metal without first washing the box with alcohol and dusting over the surface with sal-ammoniac. Wherever a tinned surface is formed, cover the remaining surface of the box with clay wash to protect it against the attack of the fused metal.

STEAM BOILER NOTES.

Advantages and Disadvantages of the Surface Condenser.

Surface condensers began to come into general use about 1859. J. F. Spencer, in a paper read before the Institute of Engineers (Scotland), Feb. 5, 1862, gave the following advantages of a surface condenser:

1. Freedom from injurious deposits in boiler. Small amount of scale.
2. Since the boilers will be stronger, steam of a higher pressure may be used than is possible with the jet condenser.
3. The foulest water may be used as the refrigerating agent.
4. The supply of feed-water to the boilers is more regular than is possible when using the jet condenser.
5. The load on the air pump is uniform.
6. Gain in the use of fuel, as the loss from blowing off is from 15 to 20 per cent less when surface condensers are employed.
7. Boilers need not be cleaned so frequently; less wear, tear and expense.
8. Can use increased expansion of steam.
9. Heating surface of the boiler is more efficient, as there is less incrustation.

Disadvantages of a surface condenser:

1. Additional pumps and machinery.
2. Additional space occupied by the machinery.
3. The use of the same water over and over again is held by some to corrode the boiler.
4. Complication of tubes, etc.
5. Liability to leakage.
6. Increased first cost of from 10 to 20 per cent, and increased cost of repair.
7. More refrigerating water is needed than for a jet condenser.

Proportions of Locomotive Boiler and Engine.

One of the speakers at the late meeting of the Master Mechanics' Association said that in his experience he had never found that a locomotive boiler was made too big for an engine. He believed in the maxim that, "Within the limits of weight and space to which you are confined, you cannot make the boiler too big or the beating surface too great." He continued:

"I would make the boiler as big as possible. First determine the size of the wheels, then proportion the cylinder to the wheels. You thus arrive at the weight of the cylinders and the working parts of the engine and you know what is left for the boiler. When you come to the matter of the relative size of the grate to that of the beating surface, then the matter becomes more complicated. The size of the grate is dependent upon the fuel used."

Another speaker agreed in a general way with the above. He said: "As a rule you can never get the boiler too large. And that is a very good plan he has outlined of designing the cylinder to suit the wheels and then making the boiler as large as possible. But unfortunately that has not been the plan usually fol-

lowed by our designers. The engineers, or those responsible for track and bridges, have generally said they want the weight on wheels to be kept down within a certain limit. The engine has to be designed to suit this, and the transportation department uses its influence to get as large cylinders as possible. Master mechanics are often induced to enlarge cylinders until they are out of proportion to the boilers and against their own judgment. The report of the committee here gives about 1300 square feet of heating surface for a 17"x24" engine. Every one understands it is a large proportion of heating surface to the cylinder capacity. The aim of the committee evidently is to encourage the designers of locomotives to make as large heating surface as possible, and also as large proportion of boilers to the cylinders as possible."

Feed-Water Heaters.

The question of the advantage, or otherwise, of the use of feed water heaters for locomotives was brought before the convention, with a request that those having experience in their use give the results. No one appearing inclined to answer, President Setchel called upon Mr. Paxton, who said, in substance, that it was well understood that there was no advantage in the use of feed-water heaters. This was not disputed, and was evidently the opinion of the members present when the question was asked.

Throttling the Steam Supply.

Every engineer who has given the subject any thought appreciates the evil effect of throttling the steam supply to an engine, and recognizes the importance of free, unobstructed steam connections. Were there, indeed, any doubt, a set of comparative indicator diagrams taken with the valve in the steam pipe wide open at one time and partially closed at another, would at once decide the matter, and show a very marked difference in the two cases in point of available mean effective pressure and steam economy. In stationary engine running this circumstance is, in general, duly considered, and willful throttling is comparatively rare, there being, moreover, no incentive to it. Examination into current locomotive practice, however, will reveal the consequently peculiar fact that throttle regulation—that is, controlling the speed of the engines by opening or partially closing the throttle valve, as the case may be—is there still used to the almost entire exclusion of the proper system of link regulation.

For a long time it has been endeavored to demonstrate to locomotive engineers the direct economy of governing their engines by the employment of the reverse lever instead of the throttle, and it would be a reflection upon their intelligence to assume that they did not fully comprehend the relative merits of the two methods. The fact that the use of the throttle continues in preference to that of the reverse lever and link, must, therefore, be explained simply by the undoubtedly greater convenience of the former method, and some system of rewarding economical engine performance would probably be the best means of bringing about the desired change.

As it now is, the greater number of locomotives, instead of being practically automatic engines, made to cut off at varying points in the stroke, according to the work to be done, by judicious handling of the reversing lever by the engineer, are made to operate on the principle of the ordinary throttling engine. Just what this difference amounts to as regards cost of running has been shown very strikingly on several occasions by trial figures. Particulars of a test, which we saw a few days ago, placed the saving of coal, when running with the throttle wide open and early cut-off, as compared with running under a late cut-off and a throttled supply, at fully 88 per cent. This case, we admit, is not entirely analogous to the one presented above, in which the locomotive may be considered alternately as an automatic engine and as a throttling engine, according to the management, still, it brings out the main point very clearly.—*Iron Age*.

PROPER THICKNESS FOR BOILER PLATES.—Sometimes owners to be over-safe will order a boiler made of very much too thick sheets, and in so doing they really make it dangerous. The heat of the flames which pass under the sheets must be passed through them to the water inside, and of course if there was no water inside, the sheets would be burned. Or if you were to apply a blow-pipe or a tuyere to the sheets, you would burn or melt them, because the plates would not carry the heat through them as fast as the water would carry it away once it got it. In the same way, if the plates are much too thick, the rivet heads will be liable to be burned and the shell itself injured upon its outside surface. Going to the other extreme, there is no economy in making a boiler of plate much thinner than one fourth inch, no matter what pressure it is to carry nor how small its diameter may be, because sheets much thinner than one-fourth inch cannot be calked well, and you will lose as much in the repair bill and in the leakage as the extra weight of metal would have cost. The mere fact that a boiler is made of 60,000-pound iron, or of best boiler steel, does not give you any guarantee that it will last long, or remain tight. It may be of such design that the different parts will expand and contract unequally, and may wrench itself to pieces in a very short time. Or, parts of it may be exposed to steady heat and not get any cir-

ulation, and hence get burned out in short order; or riveted seams may be torn down in the fire instead of being kept above the water line and out of the heat of the flame. Or the boiler may be designed and made all right, and yet be placed in some "black hole of Calcutta," and not have light enough to be inspected through and through, and hence may be allowed to develop some defect which will cause its ruin—all for lack of a little attention and repair.—*Grimshaw*.

ENGINE FOUNDATIONS.—There is not a detail in engine construction and operation that merits greater consideration or is of greater importance to the successful working of an engine than the foundation upon which it stands, and too much care cannot be accorded it, that it shall have ample spread, stiffness, unity and adaptability to the movement and operation of the parts which it supports. It should be so bonded and tied that unequal settlement shall not take place, and the height, weight and base should be of such proportion that when the engine is in full operation there shall be no swaying or twisting of the parts, no heating of the journals, no springing or tremor of the bed, arising from an unsuccessful transmission of the strains. The higher the speed and revolution, the stiffer and more solid should be the foundation, and the greater the base contact with the supporting earth. A good foundation will often decrease the defects of a poor bed, provided, of course, that such engine-bed be properly and thoroughly bolted to its foundation. When properly constructed and tied together, the engine-bed and its foundation should be portions of one complete whole, inseparable and undisturbed in their relationship by the movement of the engine parts while at their hardest work.

A LONG RUN BY A STEAM ENGINE.—Very long runs made by a steam engine are considered rare, and long runs have heretofore been considered several days, or a few weeks. The Westinghouse engine has increased this time in many instances to a number of months. The last public notice of a long run made by a Westinghouse engine was a notable instance where a certain engine ran 11 months without stopping, at a speed of 300 revolutions. The most remarkable record, however, has recently developed in the Pittsburgh Gas Light Co., where a 10-horse power Westinghouse engine ran continuously for 13 months, running at about 500 revolutions per minute, and in that time making 288,000,000 revolutions without the throttle valve being shut, and it is still running. It seems to take Burgess to beat Burgess.

SENSIBLE AND SOUND.—Petr Gibbons, in the *American Machinist*, gets down to "hard pan" in a few remarks. He makes in reviewing the published accounts of the explosion of a boiler on a tugboat, that killed the man in charge of it, when he says: "A boiler explodes because the owner is too miserly to have it repaired or replaced, the 'inspector' is incompetent or can be bribed, and the engineer will not 'kick' too much through fear of being discharged." He might have added a "cheap engineer" (?) to his list; it would have rounded up his array and covered the whole ground. We are pleased to observe that our cotemporaries are beginning to devote space to this boiler-explosion question. It is time, and there is no question more deserving the attention of mechanical editors.

COMMENT IS NOT NEEDED.—A cotemporary says: An economical firm recently put in a boiler and a second-hand engine, having previously hired power. On a visit to the new establishment the boiler was found in a dark cellar, and to see the pump a kerosene lamp had to be lighted. This establishment had no engineer nor coal-heaver. When the speed went down somebody was sent to stir up the fire, and the principal of the firm said, "We pump in water twice a day." The boiler had a glass gauge and two gauge-cocks, but the glass was opaque from dirt, and the lower gauge-cock could not be opened by ordinary hand force—it had rusted in its seat.

ECONOMICAL PROGRESS.—One of our cotemporaries rightly observes that radical changes in the science of steam engineering have not been numerous in the last quarter of a century, but improvements in the details of construction and operation have been many and of high utility. How important this progress has been in its economical results is indicated by a statement recently made that railway trains in England are now driven at an average speed 14 per cent higher than 20 years ago, with but little more than half the quantity of coal.

INCREASED WORKING PRESSURE IN MARINE ENGINES.—In 1877 the ordinary working pressure in marine boilers was from 60 to 70 pounds per square inch, and under the then British Admiralty rules further progress was barred in consequence of the required thickness of steel plates. But these rules were modified, with the result that working steam pressures of 140 to 150 pounds per square inch are now general in marine boilers. It is held that such rate may be adopted with safety, and is of much advantage for all marine boilers.

A STEAM-POWER PLANT is divided into five fundamental parts by a French author—the boiler, motor, condenser, distributing mechanism and mechanism of transmission.

OUR LUMBER INTERESTS.

The Donahue Railroad Extension.

The Redwoods of Mendocino and Lake Counties.

A late number of the *Examiner* of this city furnishes the following facts and speculations in regard to the redwood lands of Mendocino, Lake and Humboldt counties, and the prospects of reaching them by rail:

For the sake of Lake county alone it would not pay a railroad to build into it, but once there the road would never stop till it had pushed on into the Mendocino redwoods. Mendocino county joins Lake on the west, but nevertheless very hazy notions appear to prevail as to the boundaries of the redwood belt and the opportunities of reaching it by rail. Mendocino county is divided by nature into two clearly distinct parts. The western half, extending from the ocean inland a distance varying from 10 to 25 miles, is covered with redwood timber. The eastern half, from the edge of the redwoods to the watershed, between Eel river and the Sacramento, may be described as open rolling hills, suitable for grazing, with three or four limited valleys, suitable for agriculture. The dividing line, running north and south between these two wholly different kinds of country, is the summit of the range that forms the watershed between Eel river and the ocean. That summit, which is unbroken by any pass low enough for railroads, maintains an average height of from 2000 to 3000 feet. In general the redwoods may be said to end with that summit and the open country eastward to begin; and though there are some small exceptions to this general truth, no considerable body of redwood is found on the east side of the range until a point is reached 60 miles north of Ukiah by any line of railroad that could be constructed.

In fact more than nine-tenths of the redwood timber of Mendocino lies on the west side of the summit of the range next to the coast, and is inaccessible from the east by any known method of getting it to market. Spurs run down to the sea from the summit of the range, dividing the whole region into a series of independent river basins. Access to each of these basins is obtained solely from their outlets into the ocean, and as these outlets could not be crossed by a coast railroad along the Mendocino cliffs at anything short of a colossal expense of time and money, it follows that the present method of shipment by schooners is likely to prevail for many years. Access to the redwoods, therefore, is not likely to offer many inducements to railroad building into Lake county when the real facts of the case are understood. As a matter of fact, the point 60 miles north of Ukiah, which has been already mentioned as the beginning of the inland redwood growth, could not be reached by a railroad from the head of Capay valley in less than 110 miles, and such a road would have to cross one, and possibly two, ridges, in addition to the watershed between Russian and Eel rivers. As the Donahue road, which throughout its present extent to Ukiah is practically devoid of grades, could reach the same point by crossing that watershed only; and as the Donahue road, moreover, has just been given connection with the overland system, it is folly to suppose that the experienced builders of the railroad now at the head of Capay valley would choose Lake county as a thoroughfare for the pleasure of hauling redwood lumber up and down hill. When redwood on the coast of Mendocino becomes scarce instead of unlimited, when the mills cut all they can find instead of agreeing among themselves to take turns in suspending operations in order to keep up prices, when railroads begin to think it worth while to build to the northern end of Mendocino for the sake of new redwood supplies, when all these things shall happen, then it will be found that the key to the problem of successful railroad extension to the redwoods is held by the Donahue road alone.

The railroad now almost at the head of Capay valley will not be induced to proceed up Cache Creek canyon either by the prospect of large freight returns from Lake county or by the idea of making that county a thoroughfare to the redwoods.

Railroad Strategy.

The Hopland gap is impracticable for railroads. The ascent from the west is too sudden to be overcome gradually, and the summit is 800 feet higher than Clear lake. The first gap suitable for a railroad occurs in the northwest corner of the Clear Lake basin at Blue lakes. There the natural passage across the watershed is lower than any other way of penetrating the Clear Lake basin except Cache creek. This low point in the divide is 14 miles from Lakeport and 16 miles from Ukiah. It will thus, within a very few weeks, be only 16 miles from the terminus of the Donahue railroad. The extension of that road from Cloverdale is now rapidly approaching completion. For years the road stopped at the canyon of Russian river, where 11 miles of heavy grading and three-quarters of a mile of tunnels have now been overcome, allowing comparatively easy progress through the Hopland and Ukiah valleys. Its terminus will soon stand at what is practically the head of Russian River valley. The length of the road from San Francisco, 114 miles, will correspond almost exactly with the length of the Southern Pacific Company's line to Ramey, at the head of Capay valley. Should the two roads—one from the East, the

other from the West—become competitors for entrance to the Clear Lake basin, one would be confronted by the rugged canyon of Cache creek, the other by the easy passage at Blue lakes. To occupy that pass by an extension of the Donahue road from Ukiah would be a strategic movement with a double significance. In the first place, it would block the outlet northward from Clear lake, whenever that outlet should come to be desired by any railroad entering the basin from the south. In the second place, the same extension that secured that outlet would control the means of crossing in the future to the headwaters of Eel river. For the watershed between Eel and Russian rivers can be unbroken only at a point northeast of Ukiah, in reaching which a railroad would first come to a point of junction with the route to Blue lakes. The control of one is the control of the other. Should a railroad coming northward through Lake county reach that junction first, it would immediately receive and control the whole of the freight from the Eel river country that now goes to Ukiah, for that same point is passed by the wagon road over which all the freight of Northern Mendocino is hauled, and there is no road with grade low enough for it to be hauled to Ukiah any other way. These, then, appear to be the gains for the immediate present which the Donahue road has secured by its extension of 30 miles to Ukiah.

Device For Handling Lumber.

A very useful device for loading lumber has recently been patented, which is described as follows: There are uprights, preferably connected together, and pivoted in pairs opposite to each other on either side of the track, so that the top ends of each pair project slightly above the level of the truck body, so as to support the carrying bolsters on which the lumber is piled, a snitable locking device being provided for the purpose of holding the uprights in a vertical, stationary position during the period that the lumber is being piled upon them, the locking device being so arranged that upon the truck being run below the bolsters it will unlatch the lock, when the uprights immediately turn on their pivots and drop the bolsters on top of the truck, which may then be moved on its track, carrying the bolsters with their load of lumber. An incline is located on the track, which performs the double service of raising the truck, so as to elevate the end of the locking arm, and to also raise the truck, so that it will have a tendency to run back on the track after it has raised the arm, and thereby unlatch the lock which supports the uprights in a vertical position. As soon as they are unlocked the uprights have a tendency to fall forward, bringing down the bolsters, together with the lumber on the top of the truck. Instead of requiring an empty truck to be shoved into position before the lumber pilers can proceed with their work, the uprights are merely pushed back into a vertical position, where they are locked, and a fresh pair of bolsters placed on the top of the uprights, when the piling can be proceeded with, and another load made ready for the truck after it has been cleared of the lumber previously carried away, thus saving one-half the number of trucks usually employed in the transportation of lumber and the work greatly facilitated. Mill-owners and dealers in lumber generally will see at once the value of this improvement. Wm. Way of Wilfred, Ont., Can., is the patentee.

LUMBERING IN CALIFORNIA.—Ex-Governor Alger of Michigan, while in this State last spring, manifested his confidence in our lumber interests by investing therein about \$500,000. The investment consists of redwood and eugarpine lands, mills, docks and schooners, most of the former being in the vicinity of Fort Bragg. It is regarded as a queer thing by California lumbermen that whereas last year the entire State cut but 190,000,000 feet of all kinds of lumber, ex-Governor Alger himself cut from his timber in Michigan and Wisconsin 150,000,000 feet. A well-known California lumberman said, as he contemplated these figures: "It is no use talking; we talk about what we are doing at lumbering, but we haven't got started at it yet. Our machinery is inadequate to the demands. We are behind. Another thing, we do not appreciate the value of this timber. One of these days we will wake up to find thousands of improved mills buzzing in every timber region of this coast, and a value attached to the timber that we never dreamed of." Ex-Governor Alger said he was astonished that while these fine timber lands were rapidly passing into the hands of strangers, the Californians paid no attention to them, while the lands, too, were lying at their very doors. "I find," said the ex-Governor, "a magnificent quality of timber here, but the methods of getting out and sawing it are rather behind the Northern regions. The machinery is inadequate to the demands of the forests and the opportunities generally for lumbering." The ex-Governor is highly pleased with his investments in timber here, and it is said that he will buy more of it.

THE SAWMILLS OF MINNEAPOLIS, up to January 1, 1888, turned out, for the season, 210,000,000 feet of lumber—50,000,000 short of the product of the previous year.

HEAVY SHIPMENTS OF SUGAR PINE.—The Shasta Lumber Company at Redding is shipping daily from that point about 33,000 feet of eugarpine lumber.

FLOUR MILL NOTES.

Crease Dirt in Wheat.

Considerable discussion has recently been indulged in with regard to crease dirt in wheat. By some it has been considered an important detriment to flour. An intelligent correspondent of the *United States Miller* writes upon the matter as follows:

"I speak for myself only when I most emphatically pronounce the crease-dirt theory a scare. I was impressed with the subtle arguments of the exponents of this theory, and verily believed it was there. In fact, I had what looked like ocular demonstration. A series of experiments on my own hook plainly showed me that there was no such thing as crease dirt in anything like the quantity to be detrimental to the flour; let that flour be the very cream of the patent. Any miller can readily determine the facts for himself. Take a kernel of well-cleaned wheat—cleaned as well as modern machinery can clean it—then place it on a sheet of pure white paper. Take your pocket knife (the best wheat-splitter in the world) and carefully divide the kernel through the crease. As all are well aware, no machine made can make as perfect a break (first) as this; hence the experiment, or the results of this same, should have weight. Take a good glass and examine well the divided grain. Along the edge of each half kernel is a dark streak. Your knife, or other fine implement, is brought into play, and you try to remove this streak. It cannot be done unless the bran is also removed, and a good examination of that bran will still show the dark streak. The fact is, it is the color of the bran in that particular part of the berry, the same as we will find different shades of color on the main portion of the grain. The most careful handling of a single kernel of wheat in this manner will produce a minute quantity of what looks like dirt. Your glass again, and you will find minute particles of bran broken or chipped off mixed with flour and fine middlings, and an extremely small quantity of dark stuff that for the sake of argument we will call dirt. Venders of machines for the special purpose of removing this dirt claim not over one per cent of break flour is made. If we should thoroughly separate this amount and put each of the different materials in a pile by themselves, we would find something like this: One-fourth of one per cent fine bran, $\frac{1}{2}$ fine middlings, $\frac{1}{2}$ flour and $\frac{1}{2}$ dirt. Admitting this one-fourth of one per cent to really be the secretions of the crease, what is gained by putting in expensive machinery to remove it? True, it will go in with the flour, but I defy the best known expert to see any change in the color of the flour where only one-fourth of one per cent of impurities was mixed with it. 'Tis like a drop of ink in a barrel of water; it neither changes the color nor alters the taste. Millers, however, are more fully understanding the matter at the present time. Many who have experimented have saved the extra expense of looking for a huzzard and finding a mosquito."

A PORTABLE FLOUR-MILL.—At the Millers' Convention, recently held in Buffalo, a portable flouring-mill was set up in front of the Genesee hotel by George T. Smith, the great miller. This plant, consisting of a handsome mill, in dimensions 26 by 30 feet, and 47 feet high, comprising three full stories and a basement, a grain elevator 16 by 20 feet in dimensions and of the same height as the mill, and a small office, was transferred in sections to Buffalo and all three set up, by permission of the city authorities, on the street opposite the Genesee and west of Main street. The mill contains a 45-horse power engine and all the latest improvements for milling and purifying. It is built in parts, the walls being formed of asbestos and iron, and its trip to Buffalo is but one stage of its journey to the coming Industrial Exposition at Paris, France. It was run continuously in Buffalo during the continuance of the Millers' Convention, its power being supplied from the Genesee boilers. Its owner, Mr. Smith, is the inventor of the "purifying" process in use literally in almost all the great flouring-mills of the world, and a man of wide inventiveness and great liberalty. His annual expenditures on costly exhibits of the miller's art have been estimated at from \$60,000 to \$70,000. The novel spectacle of a flouring flouring industry arising in the middle of the city and disappearing in three days, was a matter of considerable interest.

THE CONSUMPTION OF WHEAT in England for the last two years, according to English authorities, has not been at the normal average of $5\frac{1}{2}$ bushels per capita. The population of Europe increased from 239,000,000 in 1860 to 347,000,000 in 1886, or rather more than 20 per cent in 26 years, or less than one per cent annually. When consumption is normal, and industries are prosperous, the consumption of wheat should be augmented at least one per cent annually.

FLOUR-MILLS IN NEW ZEALAND.—There are, according to the latest official report, in New Zealand 121 flouring-mills, 47 using steam-power; 6 steam and water; 66 water and 1 wind-mill. These mills employ 448 persons. The total value of mill property is placed at about \$1,500,000.

Coast Industrial Notes.

The Astoria salmon pack is estimated at 330,000 cases.

The State Board of Forestry is to have an exhibit at the Mechanics' Fair.

The quartz-mill of the Jenny Lind gravel mine, not far from Grass Valley, was burned last week.

The new works of the Spring Valley Water Co. of S. F., now nearly completed, cost \$1,250,000.

The new sawmill of F. M. Ellsworth, near Colfax, Washington Territory, was destroyed by fire on July 23d.

The date of opening bids for furnishing annual supplies for Mare Island has been postponed until August 14th.

The Pomona cannery is putting up large quantities of crystallized fruit, for which there is a limitless demand in the East.

All the fruit-drivers of this city, Geyserville, Cloverdale, Halesburg and Petaluma are busy with an exceptionally large plum yield.

IRON MINES have been found 35 miles from San Diego, in the Eagle Pass mountain, and capital is being solicited to develop them.

A St. Louis firm, which has been awarded the contract for the windows of the stone church the Presbyterians are building at Portland, will open art-glass works at that point.

The first trip for halibut by the Eastern fishermen who have commenced fishing on this coast, resulted in a profit of \$10,000. A new smoke-house will be put up at Tacoma, W. T.

THERE has been some talk recently among California textile manufacturers of utilizing banana fiber, which can be brought up here from Central America at a very low cost of transportation.

THE Reese River *Reveille* says John Webster has bought and paid for the old Battle mountain copper mines, and will commence work as soon as hoarding-houses and other necessary buildings can be erected.

THE Willamette Pulp & Paper Co. of San Francisco (capital \$300,000) will begin building a mill shortly at the Willamette Falls, Oregon City. From 7000 to 10,000 cords of cottonwood will be used per year.

It is reported in the Virginia City papers that California capitalists have secured immense deposits of coal, limestone and iron at Iron City, Utah, and that large sums will be spent in putting up furnaces, etc.

MANY fine lots of beef cattle are now being shipped from Nevada to California. In Northern Nevada there are whole herds of cattle that are rolling fat. In one range, about the head of the Owyhee, there are no fewer than 80,000 fat cattle.

The old boilers and machinery from Jackson's lumber mills at Casper creek, Mendocino county, have been brought down on the schooner Maxim. The output of the mill has increased to such an extent that more powerful engines are necessary.

At Tacoma, W. T., the wheat warehouses are packed full of wheat, 12 bags high, and additional warehouses, occupying a distance of 1000 feet on the water-front, are being erected. Nearly all this wheat is from the Palouse country, in Eastern Washington Territory.

THE Redding *Free Press* says: The sugar pine lumber still continues to pour down from the flume, the Shasta County Lumber Co. having fitted up some of their newly imported wagons, making about 30 in all employed by them. Their average shipment is 2 $\frac{1}{2}$ carloads a day. Could load more, but cannot get the cars.

THE sulphur works at Oove Creek, Utah, were destroyed by fire on July 23th. The losses are as follows: Four furnaces, \$5600; two boilers, \$2500; one engine, \$1500; three mills, \$1200; balting, \$300; large building, \$3000; warehouse, \$1000; 250 tons of sulphur, at \$30 a ton, \$7500; total, \$22,600. The works had been lately shut down on an injunction.

THE ship *Irby* sailed recently for Liverpool. Among her cargo were 28,857 cases of salmon, the larger proportion of which was Sacramento spring catch. The balances were fall fish. Reports received from the Naas and Skeena rivers and other points in British Columbia are that salmon are running freely. All fears of a small pack this year are now done away with.

THE Virginia *Enterprise*, in speaking of the running of the California battery-mill by the Pelton wheel, says: The pressure at the wheel is 260 pounds and the height of the column of water is 616 feet. A stream of water running through a nozzle one inch and three-quarters in size, under this pressure, upon a Pelton wheel 11 feet in diameter, affords sufficient power to run 60 stamps.

THE Visalia *Times* says: Eight mechanics, lately from San Francisco, last week filed on two sections of timber land on White river, with the intention of settling there and working up the timber themselves. They intend to put in a small sawmill at an early date for sawing lumber, which they will manufacture into windmills, doors and blinds and other commodities needed in a country that is fast settling up.

NAPA is one of the most promising industrial centers north of the bay. The establishment of woolen-mills there has been followed by other industries, among them being the works of the Napa Fruit Drying and Packing Company, the Napa Pottery and the Valley

Wine Company. Other enterprises are now taking root, the most important of these new additions being the Napa Planing-Mills, which will have a well-equipped establishment at work within a month. The Hendy Machine Shops of this city recently sent up a 50-horse power engine and boiler for use in these mills.

Two new furniture factories—one on Bush street and another on Mission—have recently been added to the number of establishments of that kind in this city. When all the furniture factories, both great and small, are counted up, it is found that San Francisco now has nearly 30. It may be roughly estimated that these factories employ 2000 men. They own some annually about 10,000,000 feet of lumber, and the value of their manufactures is said to be about \$2,500,000.

In all probability a new cannery will soon be constructed in Oakland. A corporation has already been formed, composed of a number of prominent capitalists of Oakland, who propose to construct and conduct a canning establishment, and probably the site will be selected in or near Oakland. The object of the company will be to control the fruit from the ranches in the surrounding country, which is now sent to San Francisco and elsewhere.

THE manufacture of wood paper pulp is about to be undertaken at Mott, Tehama county. The best wood pulp is manufactured from white fir, of which variety of tree there is an inexhaustible supply in the canyons near the mill recently built at that place. The mill will be run by water-power. It is intended to supply as far as possible the demands of the paper trade of Northern California, and if a market can be found in this city some of the product will be introduced here.

A NEW source of macadam supply has been discovered near Mills seminary, back of Oakland. At present all of the rock used for macadamizing purposes in Oakland and Alameda is hauled down from the hills by horse teams, but that from the newly opened bed will be taken down by rail and can be laid down in either city at a much less cost than by the present means. The Alameda county railway, now being constructed, will soon be built up to the quarry, where crushers will be erected and the work of getting out the macadam begun on a large scale.

THE Sacramento *Bee* says: "Secretary of State Hendricks returned from Folsom, and reports that the work on the canal and dam near the prison is proceeding rapidly. About 200 convicts are employed on the work, and the work is so far progressed that the next step will be to divert the steam for the purpose of making way for the great dam. The advantages of the vast power to be derived from the dam are duly appreciated, for applications have already been made for double the power that will be available, notwithstanding that the dam will not be ready for some ten months yet."

C. B. TRESCOTT, agent of S. Schmidt of New York, has been investigating the sturgeon fisheries of the Columbia river for some time, and his employer is expected in Portland in a few days to make arrangements for going into the business of catching sturgeon and shipping to New York on a large scale. There is a large amount of this fish used East smoked, and the supply of fish in the Eastern rivers and lakes has been exhausted. Two varieties of sturgeon are found in the Columbia in large quantities, and if a ready sale can be found these fish will be a great source of revenue to Oregon fishermen.

THE first advices have been received from the whaling fleet, and are very discouraging. From letters received on the steamer *Dora*, which arrived from Unalak, it is ascertained that the western shore of Behring sea is almost impassable, so thick is the ice, and that the vessels are unable to get into the Arctic. The vessels usually get into the ocean about the 1st of July, but there were no indications from the latest accounts of making the Arctic for at least a month, or probably not for six weeks later. The catch, as far as reported up to the 15th of June, is but five whales, of which the *Belvidere* obtained two and the *Fleetwing*, Annie Hicks and William Bayless one each.

A NEW cannery has been started in Shasta county, and is now at work canning peaches by the Wheeler process. The Redding *Free Press* says: The present work is only an experiment, and preparatory to working things on a much larger scale next year, and putting in a plant which will put up ten tons of fruit per day. The Oliver orchard alone is estimated in peaches alone at 5000 cans, besides the fruits, which cannot be well estimated. The girls get \$1 per day, but the wages of the others have not been definitely settled. F. H. Deakin is firmly convinced that next year a cannery on a large scale will not only be a paying institution, but a great benefit to the neighborhood in giving employment both to young and old.

THE following are the dimensions of the new pilot boat *America*, which was launched recently from Matthew Turner's shipyard at Benicia: Length, 91 feet; beam, 24 feet; depth of hold, 10 feet; tonnage, 70. The spar dimensions are: Bowsprit, 10 feet; jibboom, 18 feet; foremast, 78 feet, and topmast, 16 feet; mainmast, 79 feet, and the topmast 19 $\frac{1}{2}$ feet; foreboom, 26 feet; gaff, 22 feet; mainboom, 56 feet; gaff, 22 feet. As the masts are single sticks, the total is 94 feet and 98 feet respectively. The boat will cost, when completed, fully \$20,000. She is owned by the pilots of this port, each one taking a twentieth interest in her. The *America* is five feet longer than the *Lady Mine* and has two feet more beam.

A Drying Frame.

Geo. F. Mills of 308 California St., this city, has invented a new form of frame for drying-houses for drying fruits, vegetables and other substances from which it is desirable to expel the moisture. The frames are made to be quickly attachable or detachable, so they may easily be packed in a small space for compact storage or transportation. They are easily set up again. The frames are strong and light, yet so made that they will not sag in the middle. The detachable tray-frames are ribbed or secured on the inside, and on this ribbet is supported the ends of the cross-bars of the tray sections. These cross-bars are also ribbed on one side and have times or stiff wire rods extending through them like a rake. In arranging the tray sections the ends of the cross-bars rest on the ribbets of the side bars. The cross-bars of the tray sections are made wide enough to form a base on which the sections will stand, with the times projecting upwardly, upon which tobacco leaves or other material to be dried are conveniently spitted or hung and the loaded tray section is then turned to a horizontal position and placed in the frame. This affords a very convenient mode of loading the tray sections, and the independent character of the tray-frames from the skeleton-frame permits the frame to be loaded outside of the dry-house and then to be carried in, avoiding the inconvenience and heat met with in loading trays in the dry-house. Shaft, windlog-drum ropes and pulleys are used to wind up the skeleton-frame to its position, where the tray and frame are maintained by supporting keys. The sling is then lowered for another skeleton-frame and tray. In discharging the arrangement is such that the tray is practically suspended on pivots or trunnions, and may be readily tilted to discharge its contents into a receiver below, thus saving labor. These drying-house frames are designed to be built of large or small size to suit the requirements of farm or ranch, and are adapted to dry different products at the same time.

MR. JOHN L. DOYLE, our traveling correspondent, is now visiting Eastern Oregon en route for Idaho and Montana in the interests of this journal. We trust his visit will be of much benefit to the places visited, and that he will receive valuable aid from the patrons of our publication and other friends of the cause of education and the progress of our whole coast.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) on the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880. This is a book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, equipments and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, \$3, coin, postage free. Sold by DEWEY & CO., Publishers, 252 Market St., San Francisco, Cal.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & CO., S. F. BOUND VOLUMES.—Back files of this paper bound in substantial cloth binding with leather back, containing six months' numbers in each, indexed, can be had at this office at \$4 per volume.

J. P. SHEPHERD. N. W. SPAULDING. J. PATTERSON.

PACIFIC

SAW MANUFACTURING CO.

17 and 19 Fremont St., S. F.

Price, complete, with Pacific Saw Manufacturing Co.'s extra quality blade... \$1.50 Each.

SAWS OF EVERY DESCRIPTION

On Hand and Made to Order.

AGENTS FOR C. B. PAUL'S FILES.

Flour Mill FOR SALE.

Capacity, 3 barrels per hour; size, 40x50 feet; three stories, basement and attic; well equipped with machinery; mill race, with abundance of water; 40 acres of good land; two-story ceiled dwelling, barn, warehouse and fences; good business, healthy location. Price, \$6000. Will sell 400 or 500 acres more with this property if desired. Cause for selling is advanced age of owner.

MARION GRIFFIN,

Cottonwood, Shasta County, California.

1850. — BUILDERS OF — 1888.

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE HAZELTON BOILER

Is acknowledged by the most eminent Engineers in the country to be the greatest improvement that has ever been made in a Steam Generator.

IT IS UNEQUALED FOR SAFETY, ECONOMY AND DURABILITY.

A Saving in Fuel of at Least 20 per cent Guaranteed over any other form of Boiler.

SEND FOR CIRCULAR.

PACIFIC IRON WORKS,

Sole Manufacturers for the Pacific Coast,

127 FIRST ST., SAN FRANCISCO, CAL.

WM. H. TAYLOR, President.

R. S. MOORE, Superintendent.

L. R. MEAD, Secretary.

RISDON IRON & LOCOMOTIVE WORKS

Location of Works, S. E. Cor. Beale and Howard Sts., San Francisco.

Manufacturers and Sole Agents for the Pacific Coast for

HEINE SAFETY WATER TUBE BOILER.

BUILDERS OF

QUARTZ MILLS—Gold and Silver, Copper and Lead Smelting Works, Roasting Furnaces of all kinds.
AIR COMPRESSORS—Rope Power Transmission.
HYDRAULIC PUMPING and Hoisting Machinery.
WROUGHT-IRON WATER PIPE a Specialty. Note.—Have just completed order for 35 miles of 44-inch pipe of 4-inch iron for Spring Valley Water Works Company, San Francisco.
SAW-MILL MACHINERY of all kinds.
STEAM ENGINES—Corliss, Slide-Valve, Poppet Valve Automatic, Single, and Compound.
SOLE MANUFACTURERS for Pacific Coast of the Celebrated "Heine" Patent Safety Boiler (Water Tube); 50,000 horse power now in use.
MACHETH PATENT STEEL-RIM PULLEYS—Fifty per cent lighter and 25 per cent cheaper than cast-iron pulleys; will not break in transportation.

REFRIGERATING MACHINERY for Steamships, Breweries, and Cellars.

WILSON'S PATENT GAS-PRODUCER.

STEAM BOILERS of all descriptions.

SUGAR MACHINERY—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.

STEAMSHIPS—Steam Yachts, Marine Engines and Boilers, Screw Propellers, Centrifugal Pumps, Steamship Pumps, Steam Capstans, Cargo Winches, etc.

Builders of 120-stamp Gold Mill for the Alaska Mill and Mining Company; 60-stamp Mill for Quartz Mountain Mining Company.

Send for Circular and Price Lists.

Has the Following Advantages:

**SAFETY,
DURABILITY,
ECONOMY,
AND FACILITY OF INSPECTION and REPAIRS.**
60,000 Horse Power now in use.

Boilers can be seen working in San Francisco at Palace Hotel, Spring Valley Water Works Hueter Bros. & Co., California Jute Mills, and other places.

Guaranteed More Efficient than any other Boiler made.

Centrifugal Roller Quartz Mill.

F. A. HUNTINGTON,

MANUFACTURER OF

Centrifugal Roller Quartz Mills, CONCENTRATORS AND ORE CRUSHERS, Mining Machinery of Every Description, Steam Engines and Shingle Machines.

SEND FOR CIRCULAR.

No. 45 FREMONT STREET. - - SAN FRANCISCO, CAL.

ORE CRUSHER

ATTENTION, GOLD MINERS!

WE ARE SELLING

Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING.

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Our Silver Plated Plates have always proved as represented. We have been manufacturing them for 20 years, and use only the best Lake Superior Copper and Refined Silver. Comparing our plates with those of other manufacturers, after repeated tests, we can safely guarantee much better plates for the same money. Our plates are used by all the prominent mining men on the Pacific Coast. SEND FOR CIRCULAR.

THE RAND DRILL COMPANY,

23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity IN SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHORITATIVE CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

\$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are done from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

Room 7, No. 109 California Street, SAN FRANCISCO, CAL.**

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

FRISBEE WET MILL. — THE — DOUBLE "ECONOMIC" STAMP MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentees and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

The Westinghouse Compound Engine.

We give on this page engravings of the new Westinghouse compound engine, built by the Westinghouse Machine Co. It is really a modification of its prototype, the well-known Westinghouse "automatic" engine. The new form, by the same designer, either condensing or non-condensing, is proving itself a most economical motor. In fact, the manufacturers claim, it will develop fully the horse-power indicated upon the piston; and, still more important, will deliver a net effective horse-power to the belt upon the smallest consumption of measured water (steam) yet attained. The result is obtained, moreover, by a great mechanical simplicity. Repeated tests enable the makers to guarantee from 22 to 24 pounds of water per indicated horse-power, non-condensing, and 17 to 19 pounds condensing, the variation being according to size of engine, amount and continuity of load and steam-pressure carried.

This is a high-speed compound engine. A specific description of this compound engine is scarcely necessary, since the public, already familiar with the Westinghouse automatic engine, will understand the readiness with which this type of engine lends itself to compounding.

The form and characteristics of the automatic engine are retained in every particular. One cylinder is enlarged to practically $3\frac{1}{2}$ times the area of the other. A single valve works in the chamfered cylinder-head and is controlled by a shaft governor of the usual type. The clearance of the low pressure cylinder, which is the only one affecting economy, is by this construction kept at a minimum. A way is cored in the valve-chest in which is a by-pass valve used in starting the engine. The reliable piston valve is retained, nothing being more satisfactory in the essentials of balance, fit and wear. It should be particularly noted that the entire valve functions of admission, variable cut-off, compressor and release in both cylinders, are performed perfectly with the simplest known mechanism, namely, a single valve actuated positively from a single eccentric. The equivalent of this in the previous types of automatic compound engines is from four to eight valves, with one or more eccentrics and rods, and a formidable train of releasing or other valve gear. All transmitting parts are single acting and revolve in the oil contained in the crank-case, as in the "automatic" engine. The governor is continuously self-lubricating in an enclosed case of its own. A compensating rod is provided for the low-pressure piston when condensing, although the single-acting effect is substantially preserved by the action of the cushion in the annular air chamber. Both pistons are double-walled, and condensation is a minimum at all points. Spring relief valves take care of any water which may reach the cylinder. The rods and crank-shafts are all of hammered steel. Access is had to the crank-case in a few seconds in all but the smaller sizes, by the very neat device of slacking off the hand-wheel which binds the yoke, and swinging the latter around through a half-turn, carrying with it the two circular bonnets. From 100 H. P. and upward, a railed grating, reached by steps, is provided for convenient access to the throttle valve. The engine is strictly self-contained, requiring no outboard bearings. The exact interchangeability of parts, which has been so successful in the "automatic" engine is

carried out in every size of the compound engine.

These engines may be run at any practicable speed. It is manifestly impossible to assign a rating to a compound engine, for the reason that the steam pressures employed will vary much more widely than in ordinary practice. Compounding, while relatively advantageous at

The makers built an engine that they expected would be of about 100-horse power. This was subjected to a long series of tests very carefully made. This engine proved to be of 150-horse power at 100 pounds steam pressure, and to have a very wide margin. During the tests it was worked up to 200-horse power.

The following table gives a few of the tests

SECTION OF WESTINGHOUSE COMPOUND ENGINE.

WESTINGHOUSE 14" x 24" x 14" COMPOUND ENGINE.

ordinary pressures, implies its greatest possibilities in steam pressures of 100 pounds and upward. It is certain that compound engines will be followed by types of boilers admitting of pressures of 125 to 150 pounds.

Recently the company took an order from the Knoxville, Tenn., Thompson-Heuston Electric Light Co., on a guarantee of 25 pounds, none of the representatives of 13 of the prominent engine-builders' bidding being able to do this. The Corlies engines in every-day practice are none of them going better than 26 pounds, and usually their performance is 28 pounds. An order has been taken also in New York for three engines on a guarantee of 19 pounds condensing or 24 pounds non-condensing. The general tendency in the East is all toward high steam pressure, greater fuel economy being obtained.

of this 14x24x14 compound engine, in water rates per brake horse-power, at varying pressures and loads, unjacketed and unconnected by calorimeter.

Brake Horse Power	CONDENSING. BOILER PRESSURE.			
	120	100	80	60
200	19.62	22.53	23.17	23.17
160	18.86	20.02	21.32	21.32
130	18.38	19.56	20.84	20.84
100	19.14	19.41	20.34	20.34
70	19.8	20.05	21.43	22.57
40	22.9	23.12	24.75	25.25
NON-CONDENSING.				
200	23.94	25.2	27.7	27.7
160	25.5	26.2	28.8	28.8
130	24.32	26.24	27.7	27.7
100	25.57	27.75	29.8	29.8
90	26.51	28.3	29.8	31.7
70	29.4	30.77	32.48	36.0
40	40.65	39.3	42.75	45.82

The company has placed this engine with the

Alleghany County Electric Light Co., and it is their intention to run it under a steam pressure of 140 pounds, under which they hope to get 300-horse power; this, for an engine built for 100 horse power and developing 300, is pretty good.

The tests showed 200-horse power being developed on 120 pounds of steam, consuming 23.94 pounds of water, in the shape of dry steam, per hour. With an evaporation based on that of anthracite coal of nine pounds of water to one pound of coal, this gives a result of 2.66 pounds of coal to the horse-power per hour. Parke & Lacy are the Pacific Coast agents for these engines.

The Gold-Fields of Victoria.

We received by the last steamer from Australia the reports of the mining registrars of Victoria for the quarter ending in March. The yield of gold for the quarter was 156,817 ounces. The dividends paid by mining companies amounted to £111,149; this is exclusive of dividends paid by a few private companies who declined to furnish returns. The several mining districts contributed in the following proportions: Sandhurst heads the list with £34,800; Ballarat, £20,533; Castlemaine, £17,224; Gippsland, £16,290; Maryborough, £8000; Beechworth, £5706; and Ararat, £3593.

The total quantity of quartz reported to the mining registrars as having been crushed during the quarter was 181,157 tons 11 cwt., the average yield for which was 9 cwt. 12.75 gr. per ton.

The two highest average yields of gold per ton of quartz crushed were as follows: Hanson Heathcote, 12 ozs. 13 cwt. 8 gr.; Eclipse Company, Bendoe, 12 ozs. 12 cwt.

The mining population of the colony for the quarter is estimated at 25,947. In quartz, 12,616 miners were employed and 13,329 in alluvial mining. Of the total mining population 4076 were Chinese, a decrease of 100 on the previous quarter. The number of Chinese engaged in quartz mining decreased from 190 to 188.

A table is given showing the average yields of gold from certain lots of quartz taken from the various mines. One mine on Sandhurst, the Victoria, yielded quartz from a depth of 1770 to 1900 feet, which averaged 15 cwt. of gold per ton. The ledge is from one foot to six feet wide; 1590 tons of ore were crushed from the ledge between the depths given.

THE POWDER COMPANIES.—At a joint meeting of directors of the powder companies of the coast, the following were appointed to formulate a plan to "stimulate the business:" M. A. de Laveaga of the California Powder Co., J. R. Spring of the Giant Powder Co., Christopher Reiss of the Vigor Powder Co., A. Baird of the Safety Nitro Co. and Charles L. Howard of the Vulcan Powder Co.

ROBERT D. JACKSON of East Oakland has been appointed professor of mining in the University of Nevada, at Reno. Professor Jackson was graduated from the College of Mines at the University of California in 1882.

NUMEROUS prospectors are hunting ledges along Klamath river, on both sides, especially in the Siskiyou mountain foothills, near the Oregon boundary.

The Russell Process.

Its Practical Application and Economic Results.

(Continued from our last.)

Although nearly all the chloride of silver which can be dissolved by assay-office tests with the ordinary solution can be dissolved in the mill by the above method, so that, by taking a sample from the charges and washing it with water in the assay office to remove the dissolved silver, nearly all the chloride of silver can be removed, yet the method is entirely inapplicable in the mill. Another objection to the trough system is that the sulphides produced from the supernatant solutions are much reduced in value by the slimes and dirt from the ore.

The trough system was tried at Bullionville, Nev., in 1884, at Silver City, N. M., on tailings, and at Lake Valley, N. M., on roasted ore, in 1885. Although two of the above mills had been especially adapted to the method, it was abandoned for the reason above given. The sulphides produced by the trough system at Bullionville and Silver City assayed, respectively, one-third and one-eighth as much as sulphides produced afterward by the ordinary method.

In the *Engineering and Mining Journal* of Nov. 26, 1887, the statement is made that for Cusi ore the minimum amount of ordinary or stock solution required for trough lixiviation was 12 parts of solution to one of ore, which is 384 feet per ton, although the strength of the solution was 1.6 per cent. The average amount of stock solution used per ton of this ore, in the usual method of leaching, for a period of nine months and with a solution of only 0.75 per cent, was only 80 cubic feet. Hence the trough lixiviation, using a solution twice as strong, and requiring 4.8 times the volume, necessitated the use of 9.6 times as much hyposulphite per ton of ore. One of the evil results of this would be the production of a lower grade of sulphides and an excessive use of precipitant, as the amount of lead dissolved is directly proportional to the amount of hyposulphite used. By referring to the account of some Yedras experiments in the same journal of January 21st, it will be seen that the injurious effect of caustic lime was the same while using trough lixiviation as while leaching by the usual method, even though the tailings from the former were subjected to a subsequent treatment in the assay office.

The rate of decomposition of hyposulphite solutions is directly proportional to the extent of surface exposed, so that the decomposition of the solution will be greater for trough lixiviation than for the usual method.

In fact, aside from the numerous disadvantages, actual experience indicates that the sole advantage, if any, obtained by this method of lixiviation is the saving of 12 to 15 cents per ton expense of moving the ore from the cooling floor to the ore-tanks.

In brief, the objections to the method are: 1st. In the case of raw ores and tailings and of most roasted ores, the difficulty of removing the dissolved silver mechanically retained in the ore. 2d. The production from the supernatant solution of sulphides of much lower grade than those produced from material charged dry into the tanks. 3d. The difficulty experienced in first extracting the soluble salts from roasted ore (washing). 4th. The great increase in the amount of stock solution needed per ton of ore and its greater deterioration.

Returning to the general subject of charging, we have to consider the proportion between depth of charge and depth of leaching-tank. As explained further on, in the treatment of raw ores, the extra solution is made up in a separate tank, hence no allowance is made for the making up of an extra solution in charging the tanks. Consequently, in charging raw ores, the tanks may be filled level full, as a charge, five feet in depth, will certainly sink four or five inches, this space being advisable in order that any solution running upon the top of the charge shall not frequently run over. But, in charging roasted ore, sufficient space above the charge is left for the making up of the extra solution, unless it is necessary to run the leaching-tanks to their utmost capacity, in which case the leaching-tanks are charged level full and the extra solution is made up in a separate tank, as for raw ores. Generally, for roasted ores, the depth of the extra solution is about 34 to 46 per cent of the depth of the ore at the end of the first washing with water. These are the proportions for roasted ores which sink about two to four per cent during the washing.

The rate of leaching is not diminished by an increase in the depth of charge. For instance, at Cusi was one large tank into which the roasted ore was charged to the depth of nearly 6 feet, while in all the other tanks the depth of charge was only 22 to 24 inches; yet the rate of leaching was greater for the six-foot charge. Also, in the treatment of the raw Bremen tailings, the extreme fineness of which has already been mentioned, the rate of leaching for charges 50 inches in depth was the same as for only 24 inches. The cause of this is that the slight increase in average compactness of the charge, due to increase in depth, is more than balanced by the increase in "head" of

the liquid in the ore. Of course, it is understood that, in each case, the depth of the liquid above the surface of the charge is about the same.

That large and deep charges are the most economical, appears from the following facts: The time of leaching a 50-ton charge of ore is the same as for a 10-ton charge, if the depth of ore is the same, and is comparatively but little increased by an increase of two or three times in the depth. Less water per ton is required for a deep charge, as a given volume of water will dissolve more salts in passing through a 6-foot than a 2-foot charge. The same is true of the leaching solutions with regard to the dissolving of the precious metals. The result of using deeper charges is a decrease in the amount of chemicals required per ton, particularly when using the extra solution. The labor also is much decreased, the difference between 22 9-ton tanks (as at Cusi) and 6 or 7 50-ton tanks would be a decrease of about 50 per cent in the labor connected with the leaching operations. The decrease in assay-office work would be about 60 per cent. The amount of stock solution required is also much less, which, as pointed out later on, is an important item. In fact the difference in expenses, in favor of 50-ton as compared with 10-ton charges, is not less than 65 cents per ton. For dry regions this decrease in the amount of water required is an important item.

B.—The Chemicals.

a. Conditions regulating the amounts used. As shown in Table XIV, the weight per ton of ore of each chemical required varies considerably. The circumstances governing the variation are as follows:

Hyposulphite of Soda.—The amount required per ton varies.

First, according to the condition of the ore, i. e., whether raw or roasted. The weakening of the hyposulphite solution is chiefly due to its dilution with water while it is following the first wash-water through the ore, as in the treatment of roasted ore, and while the last wash-water is following the solution in the treatment of both raw and roasted ore. As no first, but only the last, wash-water is required in the treatment of raw ore, while both are necessary in the case of roasted ore, it is evident that the weakening of the solution in this way is twice as great for roasted as for raw ore. Also, raw ore requires less hyposulphite for another reason. In treating roasted ore, the extra solution, being always preceded by the first wash-water and nearly always by the stock solution, must necessarily be used on ore containing a liquid different from itself, with which it is diluted and weakened in passing through the ore. In making it up for roasted ore an additional amount of hyposulphite must, therefore, be used. But in treating raw ore or tailings, the extra solution is nearly always used first, and therefore on material which is perfectly dry, and no allowance has to be made for dilution.

Secondly, directly as the volume of stock solution. The hyposulphite of soda is added to the solution at the rate of a certain number of pounds per ton of ore. As the principal object is to maintain the strength of the stock solution at a certain percentage, say, 1.5 per cent, and yet use the least possible quantity of hyposulphite per ton of ore, it is evident that the smaller the volume of stock solution the less hyposulphite will be required. For instance, if, in works treating 100 tons per day, the amount of stock solution were 3000 cubic feet, the amount of hyposulphite required to raise the strength of that solution by any given percentage would be twice as great as that required for a stock solution of only 1500 cubic feet. Therefore, the amount of stock solution should be as small as possible.

Thirdly, directly as the strength to be maintained. Evidently, the amount of hyposulphite per ton of ore required to maintain a certain strength of solution, will depend upon what that strength is to be. For instance, each pound of hyposulphite will decompose to about the same extent, whether it is in a strong or weak solution. Therefore, in a given time twice as many pounds will decompose in a two per cent as in a one per cent solution.

Fourthly, inversely as the richness of the ore in metallic compounds dissolved by the solution. In the dissolving of the metals of the ore by the leaching solutions, little or no hyposulphite is lost or destroyed, as the S_2O_3 of the sodium hyposulphite attaches itself to these metals only temporarily, and again returns to combination with sodium as sodium hyposulphite, when the metals are precipitated with sodium sulphide. Also, in the manufacture of sodium sulphide, hyposulphite of soda is formed as a by-product, which enters the leaching solution when the sodium sulphide is used as a precipitant. As the amount of sodium sulphide used in precipitating a given volume of solution, and consequently the amount of hyposulphite entering that volume, varies as the metal contained in it, and as the ordinary solution, in passing through a charge, seldom or never dissolves such an amount of metal as to become saturated, but approaches nearer to that point in proportion to the richness of the ore in silver, copper and (to a certain extent) lead compounds soluble in the solution, the increase in strength of that volume of solution will depend upon the richness of the ore. If only a weak solution is to be maintained, this addition to the strength of the hyposulphite solution may be sufficient to make up for the weakening from all causes.

Fifthly, inversely as the capacity of the

works. Although the strength of the solution makes a difference in the volume of solution required to leach a ton of ore, it makes little difference in the amount of stock solution required for works of a given capacity. It is found in practice that, with ore tanks and precipitating tanks of the proper dimensions, the volume of stock solution required is less in proportion for works of 100 tons per day than for those of 50 or 25 tons. Therefore, it is evident that more hyposulphite per ton of ore will be required to keep up a given strength in works of small than in those of large capacity.

Sixthly, according to the order in which the charges are treated. The volume of stock solution, and consequently the amount of hyposulphite required to maintain its strength, depends upon whether the charges are treated in rotation and with regularity, or so irregularly that the number of charges requiring solution varies considerably at different times. Regularity in the treatment of charges is of importance for other reasons also.

Seventhly, with roasted ore, as the ore is acid or alkaline. The difference in weight of chemicals required by acid and alkaline ores is very marked. Below is given the amount of hypo used in each case per ton of ore:

ACID ORES.	
Ontario.....	5 lbs. Hypo
San Antonio.....	7 " "
Sombrerete.....	5.3 " "
San Bartolo.....	3.0 " "
Average.....	5.06 lbs.
SIMPLE ALKALINE AND ARSENICAL ALKALINE ORES.	
Veta Grande.....	4.0 lbs. Hypo
Sierra Grande.....	2.6 " "
San Miguel.....	3.7 " "
Daly.....	1.5 " "
Average.....	2.9 lbs.

The difference is due principally to the fact that both extra and ordinary solutions may be used much weaker for simple alkaline than for acid-roasted ores.

2.—*Bluestone.*—The amount of bluestone used per ton of ore depends

First, upon the condition of the ore, i. e., raw or roasted. As shown in Table XIV, the average amount of bluestone for raw ores is 2.53 lbs., and for roasted ores 5.6 lbs. per ton.

Secondly, in the case of roasted ores, upon the acid or alkaline character of the ores. For the four acid ores, Ontario, San Antonio, Sombrerete and San Bartolo, the amount of bluestone per ton is 6.8 lbs. On the other hand, for the four alkaline ores, Lake Valley, San Miguel, Veta Grande and Daly, the average is only 4.4 lbs. per ton of ore.

Thirdly, upon the method of using the extra solution. If the extra is preceded by the special extra solution, the amount of bluestone required per ton is considerably diminished.

3.—*Caustic Soda and Sulphur.*—The weight of sulphur used in making sodium sulphide is always two-thirds of the weight of caustic soda. The weight of caustic soda, and, therefore, of sulphur, depends

First, upon the richness of the ore in metallic compounds soluble in solution, but not soluble in water. It is evident that the amount of precipitant required per ton will, other things being equal, vary as the amount of silver to be precipitated or directly as the value of the ore in silver. Of the forms of copper occurring naturally, only one, so far as known, namely, carbonate of copper, is soluble in solution, and at the same time insoluble in water. As it is not likely to occur in roasted ore, it is only of importance in this connection when it occurs in an ore treated raw. Dichloride of copper occurs to a small extent in chloridized ores and is soluble in the hyposulphite solution, but practically insoluble in water. Sulphate of lead occurs in roasted ore and sometimes in raw ores, and is slightly soluble in hyposulphite solution. The amount in excess of 0.5 per cent present in the ore is immaterial, as only a few pounds, in any event, would be dissolved during the leaching.

Secondly, upon the amount of bluestone used and the mode of using it. Evidently any unnecessary increase in the amount of bluestone used per ton should be avoided; for, with the exception of that part of the copper taking the place of the silver dissolved by the cuprous hyposulphite, and the small part expended in counteracting the effect of caustic soda or lime, the copper is precipitated by the sodium sulphide, increasing the consumption of the precipitant and lowering the grade of the sulphides. As the amount of bluestone used per ton of ore varies as the ore is raw or roasted, and (with roasted ore) as it is acid or alkaline, the amount of caustic soda is, indirectly, dependent upon the same conditions, the amount used being less for raw than for roasted ores, and less for alkaline than for acid ores.

4.—*Soda Ash.*—The amount of soda ash needed per ton of ore depends

First, upon the presence or absence of sulphate of lead. The amount of sulphate of lead in an ore (when over 0.5 per cent) makes, for reasons already mentioned, but little difference in the consumption of soda ash.

Secondly, upon the amount of sulphate of lime in stock solution. If the stock solution is saturated with sulphate of lime, its dissolving power for sulphate of lead is decreased, approximately, one-half. The presence of such a percentage of sulphate of lime would, however, prevent the economical use of soda ash for the precipitating of the remaining half, and is undesirable in other ways. In treating lime ores, soda ash is not generally used.

Thirdly, upon the temperature of the solution. The amount of soda ash required varies as the temperature of the solution, since lead

sulphate is more soluble in hot than in cold solutions.

5.—*Sulphuric Acid.*—Acid is used for two purposes, the acidifying of the first wash-water for roasted ores, and the neutralization of caustic impurities in the solutions. Its use is confined almost entirely to the treatment of roasted ores. The weight of acid used per ton depends:

First, upon the state of the ore, i. e., raw or roasted. As raw ores have no first wash-water to be precipitated, and no caustic alkali is present in raw ores, it can enter the solution only by means of the sodium sulphide. This amount is so small that it is generally neutralized by the extra solution, so that, when extra solution is used, no acid is required in the treatment of raw ore.

Secondly, upon the acidity or alkalinity of the first wash-water. In treating roasted ores, the silver is usually precipitated from the first wash-water by means of acid and old iron. The amount of acid required per ton varies according to the condition of the first wash-water. If it be alkaline, more acid must be used than if it were neutral or acid. The state of the first wash-water varies with the nature of the ore. Very base ores often produce such an acid wash-water that no further addition of acid is necessary. But "fres" ores usually produce a neutral or alkaline wash-water. Often, even when the wash-water is quite alkaline, the amount of silver dissolved from the ore by it will be more than one-fourth of the silver in the ore, and sometimes (as at the Sierra Grande) mere dilution with water will fail to precipitate it, nor will precipitation take place on organic substances within a reasonable time, nor on iron or copper until the addition of sufficient acid.

Thirdly, upon the amount of silver extracted by the first wash-water. Often, as at the Ontario with a Staatsfeldt furnace in 1883, and at Sombrerete with a reverberatory furnace, the amount of silver dissolved by the first wash-water is so small that it is not precipitated, so that no acid is required.

In other cases, as at the Sierra Grande, the amount may be 30 per cent of the value of the ore, and two pounds of acid may be required.

Fourthly, upon the presence or absence of caustic lime in the ore. The presence of caustic lime in the roasted ore usually doubles the amount of acid required for precipitating the wash-water, making it two pounds for such ores, as against one pound for ores producing a neutral wash-water.

Fifthly, upon the mode of using the extra solution. Hydrate of copper is practically insoluble in the ordinary solution, so that the extra solution acts as well as an acid as far as the neutralization of caustic alkali is concerned. But as the bluestone is usually added to only a small portion of the ordinary solution, its effects are confined to that portion. So, in the case of alkaline roasted ore, where the amount of caustic alkali is always greater than for raw ores, it might seem that the bluestone used would not be sufficient to neutralize all the caustic alkali, and that the use of acid might become necessary to the extent of one-half to one pound per ton. This, of course, would be the case in the treatment of roasted ore containing caustic lime if it were not for the fact that the extra solution is usually employed on such ores in such a way as to counteract entirely the effect of the caustic alkali. If the ordinary solution is used first, before the extra, the caustic alkali acts injuriously upon the silver compounds dissolved by it. For this reason, the extra solution is used first, and in such a volume that, although weak, it protects the silver from the action of the caustic alkali.

Sixthly, upon the mode of precipitating the first wash-water. Of course, the amount of acid used will depend upon the mode of precipitating the first wash-water, whether by that method just described or by dilution or by sodium sulphide.

(To be Continued.)

WHERE THE SPECIMENS CAME FROM.—The Julian (San Diego county) *Sentinel* says: The San Diego papers continue to waste their valuable space in trying to make people believe that Lower California is a rich mining country. They have been at it now for over six months, but the longer they "whoop up" the rich (?) strikes in Lower California the worse the public gets disgusted with them. As yet no gold-quartz specimens really coming from Lower California have been exhibited in San Diego, although a well-known real estate firm there keeps stacks of beautiful rock on exhibition in its office. Where does it come from? The answer is simple. Some time since a gentleman living at present in Julian, went to San Diego, taking with him a beautiful specimen of quartz from the Gold King mine. He was showing it to some of his friends on the corner of Sixth and F streets, when it very mysteriously disappeared. The next place he saw it was in a show-case in said real estate office, labeled "From Lower California." So it is with all the specimens that are sent to San Diego from Julian. They are hoaxed and exhibited as "Lower California minerals." We will admit that some very little inferior gold has been found in Lower California, but there is not water enough in the country to work it. We would advise our San Diego contemporaries that when they want to write up another boom article they do so at home—don't go to Mexico. Send out a good reliable man and let him stay a week or ten days in the Julian district.

The Lucky Prospector.

The Ups and Downs of a Prospector's Life.

About the happiest mortal this side of Kingdom Come, says the *Nevada Herald*, is the man who has just struck it rich. After months and years of weary toil, of despairing hopes and continued disappointment, to suddenly strike rich ore will come as near setting a man wild as it is possible for good luck to do it. It is true, even rich strikes do not always prove lasting, and many times the wildest visions are dissipated by future developments. But while the fever is on there is no disease under the sun like it.

When Mark Twain and Higby struck that "blind lead" which held its independent way through the "Wide West" vein, cutting it diagonally, and knew it was separate property, and they could locate it, any prospector knows just how they felt, but no one can express the feeling as well as Mark Twain. Any one can imagine Twain's feelings when Higby exclaimed in a stage whisper, after coming out of the shaft: "I knew it! We are rich! It's a blind lead!" And after the notice had been put up and duly spread upon the Recorder's books, and the two had gone to their bed at midnight, who cannot readily understand why sleep refused to visit their eyelids? It is easy for any one who has prospected and thought he had struck it rich to realize how they could do nothing but lie awake and think, and dream and scheme. How the floorless cabin would turn into a palace, the ragged gray blankets into silk, the rickety furniture into mahogany! One can see how natural it was for Higby to ask of Mark when he was going home to the States and how he answered next month. How they discussed what city they would settle in, and what kind of a mansion they would build. How they talked of a trip to Europe, and how long they would remain over there, and how they figured on spending at least \$40,000 or \$50,000 so as to make it a swell trip. How, finding sleep impossible, they arose and played cribbage and smoked till sunrise, and then discovering that nature required food, even after one has struck it rich, they had to go to work and cook their own breakfast and fry their own flapjacks. One can readily understand how the news flew around the camp, and how people rushed in to see for themselves; how, when offered \$200,000 each for their share, they squandered everything short of \$1,000,000 cash down. These experiences are quite common to the prospector, though perhaps on a smaller scale. And most prospectors have in the end had an outcome very similar to that of Twain and Higby with their "blind lead." Twain went off to see a sick friend the next day, leaving a note for Higby to not fail and do the ten days' work necessary to hold the lead. Higby happened not to go to the cabin till the day Twain returned, when both found that the time had expired and the "blind lead" had been jumped. Then they sat down sick, grieved and broken-hearted. While a minute before they had been rich, now they were paupers—in debt even to their butcher. Every prospector can closely follow the course of their thoughts during the period of months that followed. It is the same old story with them all. At the top round of the ladder one day, at the bottom round next. Rich as Croesus one minute, poor as Lazarus the next. That is the life of the genuine prospector. As some tickets draw prizes in lotteries, so some prospectors hit it genuinely rich. And as a great majority of lottery tickets are blanks, so a majority of prospectors discover their finds worthless. As a rule the old fellows breathe their last in a charitable institution, or alone and neglected, in their lonely cabins. They are a race of beings separate and distinct from the balance of the human family, as much as the aborigines are distinct from the civilized races. They are the most generous, the most improvident and generally the poorest men in existence. Yet the gold and other precious metals that have enriched the world would doubtless still lie hidden in the bowels of the earth had it not been for the prospector. He has withstood the cold of winter, and the heat of summer, to uncover mines of wealth for others. He has deprived himself of the comforts of life that the world might have gold and silver, and when death comes it generally finds him asking for enough to appease the pangs of hunger, but it is given to him sparingly. Soldiers are pensioned for their services to the country, and so should the genuine prospector become the ward of a beneficent government. When such pioneers are placed under the sod, a monument should be erected over their remains, with the inscription: "Here lies a man who devoted his life for the benefit of others; who made the world rich, but who lived in squalor and rage and died in wretchedness at the end."

JOSEPH D. REDDING, United States Fish Commissioner for this coast, states that from all indications he has every reason to believe that the lobsters recently transplanted here are thriving. On being placed in the bay they took naturally to their new surroundings and made themselves at home. No dead ones have been seen since, and this is conclusive proof that they are doing well on the rocky bottom of their new home.

LEWIS LELAND of the Leland hotel at Chicago contemplates building a large hotel at the City of Mexico for the accommodation of tourists.

Two Shafts on Mines.

We gave in the *PRESS* two weeks since a letter from E. W. Roberts of Grass Valley, calling our attention to a law now in force, requiring two shafts on mines in this State. The law was approved March 16, 1872, and is as follows:

The People of the State of California, represented in Senate and Assembly, do enact as follows:

SECTION 1. It shall not be lawful for any corporation, association, owner or owners of any quartz-mining claims within the State of California, where such corporation, association, owner or owners employ twelve men daily, to sink down into such mine or mines any perpendicular shaft or incline beyond a depth from the surface of three hundred feet without providing a second mode of egress from such mine, by shaft or tunnel, to connect with the main shaft at a depth of not less than one hundred feet from the surface.

SEC. 2. It shall be the duty of each corporation, association, owner or owners of any quartz mine or mines in this State, where it becomes necessary to work such mines beyond the depth of three hundred feet, and where the number of men employed therein daily shall be twelve or more, to proceed to sink another shaft or construct a tunnel so as to connect with the main working shaft of such mine as a mode of escape from underground accident or otherwise. And all corporations, associations, owner or owners of mines as aforesaid, working at a greater depth than three hundred feet, not having any other mode of egress than from the main shaft, shall proceed as herein provided.

SEC. 3. When any corporation, association, owner or owners of any quartz mine in this State shall fail to provide for the proper egress as herein contemplated, and where any accident shall occur, or any miner working therein shall be hurt or injured, and from such injury might have escaped if the second mode of egress had existed, such corporation, association, owner or owners of the mine where the injuries shall have occurred, shall be liable to the person injured in all damages that may accrue by reason thereof; and an action at law in a court of competent jurisdiction may be maintained against the owner or owners of such mine, which owners shall be jointly or severally liable for such damages. And where death shall ensue from injuries received from any negligence on the part of the owners thereof by reason of their failure to comply with any of the provisions of this Act, the heirs or relatives surviving the deceased may commence an action for the recovery of such damages as provided by an Act entitled An Act requiring compensation for causing death by wrongful act, neglect or default, approved April twenty-sixth, eighteen hundred and sixty-two.

SEC. 4. This Act shall take effect and be in force six months from and after its passage.

Petroleum in San Luis Obispo County.

As we noted at the time, Mr. Ezra Carpenter some weeks since determined to sink a well for oil at a point a short distance from the quarries of the Bituminous Rock Company. A contract was entered into with parties having an outfit for the purpose, to go down 1000 feet as a matter of experiment, and the work was commenced and has since been pushed industriously. We learn from Mr. Carpenter that the first 31 feet was bored through soil, when water was reached and a formation of soft sandstone. Going through this for 51 feet, a stratum of hard sandstone was met nine feet in thickness. Passing that, sandstone was again encountered and faint indications of oil, which have grown stronger until now, at a depth of 180 feet, the oil is present in very perceptible quantity. Mr. Carpenter Wednesday brought in a can of the sand, oil and water fetched up by the drill, in which the presence of petroleum is unmistakable. So the work proceeds with good heart and firm hopes of fortunate results.

Judge Beebe, in speaking of the matter, referred to the past and to former hunts for oil, the earliest being about 1865, when the oil excitement was at its height in the East, and the celebrated Professor Silliman chanced to be on a visit to this county. As a result of the professor's favorable opinion of the chances for striking oil in this vicinity, wells were started, one near Mills' Station and one near the Tar Springs, on the Huasna road, but were abandoned in discouragement after sinking about 400 feet. No such favorable indications were found in either well as the Carpenter well now shows. Prof. Silliman was of the opinion that beyond the shadow of a doubt there were very great deposits of oil in this vicinity. The great masses of sandstone, heavily saturated, not with bitumen or asphalt, or like products, but with petroleum, proves it beyond question. It only remains for some enterprising capitalist to explore to a sufficient depth and to the right place to tap the hidden wealth, and in so doing to vastly increase his own riches and open up a great era of progress and prosperity for the county.—*Tribune*.

A COMPANY of English capitalists have organized to turn the Feather, two miles above Oroville, and to work an extensive gold bed. It is estimated that \$100,000 will be required for the work.

Monster Pumps.

The Spring Valley Water Co.'s New Works.

The new pumping works of the Spring Valley Water Co. near Belmont, says the *San Mateo Times and Gazette*, are about completed. Few people have any conception of the magnitude of these works, nor even, when the purpose is known for which the pumping station has been built, will it seem possible that so much machinery and such an outlay of money has been necessary to overcome that which, to the unfamiliar mind, seems but a trifling obstacle.

It is well known that the immense water-pipe which is now being laid through this county and across the bay at Ravenswood to carry water from Niles canyon, Alameda county, to San Francisco, has not sufficient fall to conduct the water through to its destination, and to furnish this required force the pumping works now in course of construction at Belmont were designed.

Before a detailed description is given of the buildings and machinery to be used, the writer will explain the means by which the water is thoroughly purified and finally given sufficient headway to carry it on to the city. The large main turns from the county road opposite the pumping works, and the water will be conducted in a 30-inch pipe through a series of concrete wells or cisterns where it will undergo a purifying process. In the first cistern the sand is removed; in the second the water passes through 40 screens, which are intended to remove all other impurities it may contain. It will then be conducted to a large receiving well which connects with two other wells, from which pipes lead to the two large pumps inside the building. These pumps force the water through a 30-inch pipe up the adjoining side hill, a height of 192 feet, into what is called a stand-pipe, 80 feet high. This pipe is made of wrought iron and is six feet wide at the base and three feet at the top. It is a sort of receiving well or tank designed to give more fall to the water. A 36-inch pipe laid parallel with the ascending pipe will conduct the water down the hill to the main, and with the force thus gained the water will be conducted to the company's reservoir on University mound, from where it will be distributed throughout the city.

The building, which is of solid framework covered with corrugated iron, is divided into two departments, an engine and a boiler room. The engine-room, which is 75x62 feet, is a perfect maze of machinery. The floor is of solid concrete to a great depth. Here stand two immense Corliss compound (high and low pressure) engines and pumps placed tandem, each with a capacity of over 4,000,000 gallons per day. Each of these engines is driven by a fly-wheel 16 feet in diameter and weighing 16 tons. The plungers of the pumps are 12½ inches in diameter and have a stroke of 42 inches. From each pump is a 20-inch cast-iron pipe, both of which join and connect with the 30-inch pipe in which the water is forced up the hillside. The air chambers on the pumps are 20 feet high.

In the boiler-room, which is 36x100 feet, located in the southern wing of the building, stand four vertical Hazleton boilers, two of which will burn coal and two petroleum, which will be procured in Santa Cruz county. Each boiler stands 27 feet high and has a 30-foot smokestack. It is calculated that the boilers will consume 10 tons of coal and 50 barrels of petroleum every 24 hours. The engines are from the Union Iron Works and the boilers were built at the Pacific Iron Works, San Francisco, and are of 200-horse power.

Alongside the building is the coal-dump, which is 90 feet long, 60 feet wide and 15 feet deep. Here also are located the large petroleum tanks, each with a capacity of 2000 gallons. A side track has been laid from the main road across the coal-dump and petroleum tanks, so that the fuel can be unloaded close to the boilers. Inside the boiler-room is a small steam pump which will be used for supplying two of the boilers with petroleum from the tanks. Another small steam pump will supply the boilers with heated water. In the engine and pumping room is a lifting crane, which is so arranged on rollers overhead that heavy pieces of machinery can be moved from one part of the building to another with ease and safety.

At the southern end of the building is a large reservoir with a capacity of 4,000,000 gallons for collecting the water while the pumps are not running. It is also connected with the pumps, and water can be taken from it should the main pipes fail at any time in their supply through accident or otherwise. Work has been pushed as fast as possible on these works since last March, and in another month everything will be ready to commence pumping. Mr. B. W. Hayes is the superintendent of the inside work, and will, when the works are completed, have charge of the station. He is an engineer of unquestioned ability, and informs us that these works are the most extensive of the kind on the coast. Fifty men have been employed regularly since the work commenced, and an additional 50 will be required before it is completed. Mr. H. W. Walker has charge of the outside work. Most of the dirt taken from the excavation has been distributed on the county road, and some has been used in filling up the tide lands on Wm. Newhall's place.

THE telegraphic facilities between Portland and San Francisco are to be enlarged.

The Copper Corner.

A Paris dispatch to the *New York Herald* says: The *Herald* correspondent called last evening on Baron Sonbeyran, who knows as much as any one about the Rio Tinto complications. "Can the Secretan copper syndicate carry the road they have undertaken? What will become of the English speculators who have been selling short? What about the general condition of the copper market?" These are some of the questions I put to the celebrated financier, and here is his reply:

"There has been much needless and extravagant talk in regard to this matter. Secretan and his associates are engaged in an enterprise in no way different from any similar ones already accomplished. The same thing has been done in cotton, wool and coffee; why not now in copper? I know the resources and abilities of those interested in the scheme, and I can give you the most unqualified assurance that they are abundantly able to bring this operation to a successful termination."

"There is nothing extraordinary about the present price of copper. It has varied between £40 and £120 for Chili bars and it is now in the neighborhood of £80, which allows a reasonable profit for the mining companies without being a burden to the consumers."

"As to the syndicate being unable to support the strain of the copper they are buying and holding, such talk is utter nonsense. They could hold that and very much more were it necessary. English speculators, of course, are interested in spreading contrary reports, but when the time comes for them to make good their contracts, we shall see who will get the worst of it. They will find themselves in a trap from which the only escape is in handing over the difference. You may be quite sure the French syndicate knows what it is doing."

"I found that Secretan was absent from Paris, but I was able to see M. J. Laveissiere, whose extensive interest in copper mines is bringing him into very close relations with Secretan."

"I have the most perfect confidence," said he, "in the ability of Secretan to carry out what he undertakes. For eight months we were sinking large sums of money in one mine, and had things gone on as they were we should soon have been obliged to abandon the work. Most of the copper companies would have been ruined, and those remaining, having full control of the market, would have succeeded in forcing prices up to the highest point. As it is, copper quotations are stationary at reasonable figures, and they remain there. If the English operators are counting on lower prices, they are doomed to disappointment. In my opinion the law of France would undoubtedly require mining companies who made contracts with Secretan to fulfill them. On the whole I see nothing remarkable about the present condition of the copper market except that it is remarkably satisfactory."

Around Mokelumne Hill.

The *Mountain Echo* says: We are informed that the residents of Mokelumne Hill are becoming encouraged with the future mining outlook for that place, and base their expectations upon the development of the numerous quartz lodes of that section that have never been tested. There is not a quartz vein in that locality that has been prospected beyond a depth of 125 feet, and we doubt if that depth has in any instance been attained. The Moser quartz mine, situated a short distance from that town, is being prospected at present, and, we understand, is making a favorable showing. Mr. Moser informs us that he has shipped a batch of assorted ore to San Francisco for reduction, which assayed a fraction over \$100 a ton. He also informs us that as depth is attained in the mine the ore increases in richness. Why there should not be ledges in that locality equally as productive as the mines of Angels and vicinity we cannot understand. The lodes of the Mokelumne Hill district are situated on the same quartz belt and the croppings are just as prominent and distributed over as much territory as the lodes in Angels. But one thing is certain, the pay ore is deeper than in Angels and the adjoining districts. This fact has been demonstrated in several instances. It is useless for an individual or a company of small means to attempt to handle that character of mining property. The introduction of men of capital into that section would soon lead to the development of the quartz lodes there, and, after a proper test, we feel satisfied that the results would be astonishingly remunerative. The ore of that section is not of a rebellious character, and, in consequence, can be reduced at less expense than ore found in many other parts of the county. We are satisfied that the time will come when the merry chorus of stamps will be heard in Mokelumne Hill, and that business of all kinds will become as active as in the primitive days of placer mining. Bring your mines to the notice of capitalists and let your inducements be reasonable and inviting.

AURORA.—Aurora is steadily improving in every respect, and the population is increasing. Capital from abroad is being brought to bear on Aurora, and it is having the effect of unearthing some of the richest prospects that have been encountered in that vicinity for years. Everybody rejoices over the new lease of life for that once thrifty camp.

Passing Events.

Another revival of the Meadow Lake mining district is in progress. The mill has just completed its first run and a bar worth \$580 has been shipped. The ore assayed \$14 per ton, and they made a net profit of \$4 a ton on the lot worked. The mill will continue to run during the season.

The people of the United States feel deep regret at the death of General Sheridan, one of the great commanders of the war. His military services were highly appreciated and he was greatly respected in his private life as well.

The Mechanics' Fair opened this week. All the arrangements are not as yet complete, but in a very few days the display will all be in order. The attendance on the first evening was very large.

There is considerable complaint from the interior counties at the way the mineral lands are being appropriated and fenced in, thus restricting the area for prospecting. If matters go on as they are now doing in this regard, the miners say it will not be many years before all the mineral lands of the State will be under fence as agricultural.

The Anaconda mine, Montana, is building \$175,000 worth of new structures.

When Hydraulic Operations May Be Enjoined.

Mr. Chas. Barnard of San Buenaventura writes the PRESS inquiring if there is anything in the hydraulic-mining law prohibiting that style of mining on a stream not tributary to a navigable river. Before attempting to answer this inquiry, it may be premised that there is no statutory law regulating or in anywise relating to hydraulic mining, except such as has grown out of the rulings and findings of the courts. No bill having special reference to this subject has ever been enacted by the Legislature, State or national, though some attempts to secure the passage of such bill have at different times been made, but thus far without avail.

The objections to hydraulic mining, as developed by the judicial proceedings had against those engaged in the business, are threefold: 1st, the injury thence arising to the agricultural lands situated along the outletting channels to the mines; 2d, the shoaling caused to the navigable streams and the filling up of the harbors into which they empty; and, 3d, the damage done to the towns located on the banks of these streams, which, through their shoaling, have exposed such towns to be the more readily flooded during seasons of high water.

To determine whether in any case the decision of the courts could be successfully invoked to prohibit hydraulic operations, it is only necessary to ascertain whether or not such operations would cause serious harm in any of the several particulars above mentioned. If by these operations any private property is going to be injured or any public interest inconvenienced or much impaired, it may be expected that the courts will interfere to put a stop to them, the rule, briefly stated, being this: If any third party is materially harmed, the law runs against the hydraulic miner.

This class of miners in the northern part of the State have not been molested for the reason that their operations have resulted in injury to no one. The streams into which they discharge their tailings are not navigable, nor are they tributary to navigable waters. They debouch, not into bays or harbors, but directly into the open ocean, there being no large towns on their banks, or low-lying farming lands along them. Wherever similar conditions obtain the hydraulic miner has enjoyed a like immunity from molestation. Thus far, only in the more central mining counties of California have the miners been enjoined from working their claims by the hydraulic method. In no other section of the State, nor in fact in any other part of the world, has this style of mining been suppressed by legal process or even made the subject of much complaint; and that, presumably, because the objections to it have in no other locality applied with such force as in these central mining counties.

As regards the supposed case put by our correspondent, his statements are not explicit enough to warrant us in giving an opinion upon it one way or the other. This, however, may be said: Should all the parties living or owning property along a stream consent to the hydraulic miner running his debris into the same, this would not prevent his being enjoined by other parties, should his operations cause them damage.

In closing these remarks it may be observed that the courts, in considering these anti-debris cases, have of late shown a disposition to increase rather than relax the rigor of their former decisions, the opponents of the hydraulic miners, encouraged by this attitude of the courts, having all the while grown more and more exacting in their demands. Their exposure to this double fire admonishes those engaged, or about to engage, in hydraulic mining to proceed with caution, many able jurists holding the opinion that some of the decisions made in the adjudication of these cases have a very wide latitude. The court being in this instance a law unto itself, it cannot be foreseen what further in the way of original legislation may come of such little restricted judicial discretion!

GUSTAV REIS, an early pioneer of this State, died in this city Sunday night. He was formerly a resident of Downville, and at one time was one of the owners of the Sierra Buttes mine, Sierra City. Mr. Reis was president of the California Pioneers in 1886-7. He left a fortune of some \$700,000, which goes to his son John.

"The New South."

This is the title of a book gotten up by M. B. Hilliard, and recently published by the Manufacturers' Co. of Baltimore, Md. Looking over the pages of this book, one is surprised at the natural advantages possessed by the 13 Southern States in an industrial point of view, as well as at the progress made of late years in the development of their material resources. Measured by that progress, well may that section of the Republic be termed "The New South," for in all that pertains to its physical prosperity it is essentially new. Even in the habits, spirit and aspirations of its people it is new. They do not think the same thoughts, nor are they confined to the same narrow routine of business as of old. New interests and industries have everywhere grown up and a new future awaits them. From being a mere planting they are fast becoming a manufacturing and a mining people. Agriculture is also being diversified. Besides cane and cotton they are beginning to grow Indian corn and the other cereals largely. Fruit-raising, too, is being greatly varied and widely engaged in.

In 1886 there were grown in this "New South" 176,000,000 bushels of corn, 53,525,000 bushels of wheat, and 78,675,000 bushels of oats, whereas the product of corn was, under the old order of things, greatly less, while that of the other cereals mentioned amounted to almost nothing at all. In 1887 the yield of these grains was much larger than that of the preceding year. But with such increment of these crops the old agricultural staples of the country have not fallen off. The product of cotton and sugar has all the while been growing larger. The cultivation of the semi-tropical fruits, a thing unknown in the South 20 years ago, is now being practiced there with great success; not only the orange and the lemon, but the citron, banana, mango, pineapple, coconut and the date palm, being grown in the southerly tier of these States on an extensive scale, the more hardy fruits, such as the apple, plum, peach, etc., being everywhere raised without trouble and with much profit, both the soil and the climate showing themselves to be possessed of capabilities that only a little while ago were not even dreamed of. Even the pine woods of North Carolina it is found can be made to yield something besides "pitch, tar and turpentine."

But it is in the development of her mineral resources that the South is beginning to most distinguish herself. It is in her vast deposits of coal and iron, all of good quality and existing in close proximity to each other, that this region will hereafter be likely to find its greatest enrichment. It is stated in this book that a ton of iron costing \$15 in Pennsylvania can be made in Alabama for \$7.50, both this State, as well as Virginia and Tennessee, being now large producers of this metal. In 1880 these three States turned out only 178,000 tons of pig iron; in 1885, the output reached over half a million tons, which quantity has since been more than doubled. And yet the business is in its incipency.

The extent of the coal deposits of the South is, according to this authority, absolutely astounding. The "Warrior" coal-fields of Alabama are two-thirds as large as the entire coal-bearing area of Great Britain, containing, it is claimed, one thousand million tons of coal, at the lowest calculation. The value of these deposits is vastly greater than that of all the other land in the State. In 1870 all the coal raised in that section of the Union amounted to only a little over 3,000,000 tons. In 1880 the quantity had doubled; in 1885 the output of 1880 had again more than doubled, having amounted to 14,511,539 tons, the increment since having been in nearly the same ratio. While the manufacture of coke has not increased at the same rapid rate, it has, nevertheless, been very marked. The annual product of this fuel approximates now 2,000,000 tons, while in the coking districts new ovens are being put up as fast as possible to meet the constantly increasing demand for this fuel.

In the various branches of manufactures, especially in cotton, the "New South" is also making rapid strides. They have now running about 400 cotton-mills, operating over a million and a half spindles and fully 30,000 looms. The progress made by the South since 1880 in this department of industry has been at the rate of 104.5 per cent against 21.3 per cent in other parts of the country. Railroad-building has

there been advanced at the same rate, Texas having in this respect been the leading State. The material progress of the South during the past two decades has, in short, been phenomenal, and should it continue to forge ahead as it has been doing of late, the North and the West will find in these Southern States a very formidable competitor in many of their leading industries.

Foundry Notes.

On Monday afternoon at the Union Iron Works the first steel plate was hoisted for the keel of the San Francisco, a steel cruiser resembling the Charleston, but larger by 400 tons and having more powerful engines, and also the advantage of sail power, which the Charleston has not. Work also still continues on the cruiser Charleston recently launched.

The 30-ton boiler recently made in this city at a cost of \$20,000 for the steamer North Pacific, was dropped overboard at Tacoma while being landed from the steamship. It broke through the guards of the steamer and sank in 30 feet of water. Divers are at work recovering the boiler.

The committee of the striking boilermakers waited on President Taylor of the Rison Works and offered to go back to work if Superintendent Anderson were dismissed or suspended for three months. Mr. Taylor refused to entertain the proposal, and the men, after another conference among themselves, asked if they would be taken back as a whole, as if nothing had happened. This was agreed to and the men returned to their work.

On Saturday last the new steel tug Active was launched from the yard of the Union Iron Works. The tug is a beautiful model, somewhat smaller than the Relief. Her dimensions are, length, 100 feet; beam, 22 feet; hold, 13 feet. She will be fitted with compound engines, the cylinders of 20 and 38 inches diameter, with a 24-inch stroke. The Active is the first steel tugboat built on this coast. Her boiler is 13 feet 6 inches in circumference and 12 feet 6 inches long. Her propeller is 9 feet 6 inches in diameter. She will carry 115 pounds of steam and make 14 knots an hour. Her draught of water is 12 feet aft and 8 feet forward. She is all steel except the captain's room and pilot-house, which are of teakwood, finished with cherry and ash panels. She will consume 10 tons of coal in 24 hours, and will carry 65 tons in her bunkers. She is divided into compartments by five water-tight bulkheads.

The new steam schooner Protection, recently launched, is 158 feet long, 31 feet beam, and 10 feet 6 inches depth of hold. The engines were built by Savage & Sons, and are compound, with a 20-inch stroke. The wheel is 8 feet 6 inches, and the boat is calculated to steam when loaded about 10 knots an hour. The owners are the Navarro Mill and Lumber Company, and the Protection will carry lumber between this port and Navarro Ridge.

The stockholders of the Rison Iron and Locomotive Works held their annual election at the office of the company on Monday, corner of Beale and Howard streets, and re-elected the following officers for the ensuing year: Wm. H. Taylor, president; Robert S. Moore, vice-president and superintendent; Lewis R. Meade, secretary.

CON. CALIFORNIA AND VIRGINIA.—The bullion report of the Con. Cal. and Virginia for the month of July is as follows: There was worked at the Morgan mill 4950 tons of ore; bullion produced—gold, \$55,368.23; silver, \$70,412.77; total, \$125,781. Yield per ton—gold, \$11.18; silver, \$14.22; total, \$25.41. Assay value of the ore per ton, per battery samples, \$36.60. Worked at Eureka mill, 2950 tons of ore. Bullion produced—gold, \$37,461.39; silver, \$43,429.87; total, \$80,891.26. Yield in bullion per ton—gold, \$12.69; silver, \$14.72; total, \$27.42. Assay value of the ore per ton, per battery samples, \$34.85. Total ore worked, 7900 tons. Total bullion produced—gold, \$92,829.62; silver, \$113,842.64; total, \$206,672.26. Average yield in bullion per ton—gold, \$11.75; silver, \$14.41; total, \$26.16. Average assay value of the ore per ton, \$39.95.

THE quartz mill at the Deadwood mine, Willow Valley district, Nevada county, was burned on Tuesday night. Loss \$10,000. The mill has been used lately for custom work.

Prospecting in Alaska.

The residents of Alaska are quite hopeful of the future of the mining industry in that great Territory. Within the past few years attention has been directed there, and the success of the Douglas island ventures has caused further prospecting and development. Recent sales of mining property show that there is a feeling of more confidence than formerly. It is asserted, moreover, that the Canadian Pacific R. R. Co. has bought lots for wharves at Juneau, and will put a new line of steamers on the Alaska route. This will give direct communication with Eastern cities. Now about all the Alaska trade is done with this city by means of the Pacific Coast Steamship Co. It may be new to many to know that San Francisco is several hundred miles east of midway between the easternmost and westernmost shores of the United States. Yet this is the case. It is nearly 4000 miles from the longitude of the most western of the Aleutian islands, directly east to San Francisco, while it is not over 3500 miles from here to the longitude of the east coast of Maine.

While Sitka is the capital of Alaska, Juneau is the chief settlement and the headquarters of the mining business. Juneau is 150 miles south-east of Sitka. Three small creeks on the shore of the mainland lead to basins back of the mountains, where rich placers have been worked for several seasons. The best time to visit Alaska for pleasure is from May to September inclusive. Prospectors and miners take either the April or May steamers, so as to be on the ground when the snow melts.

It is in Southern Alaska that the mines have been discovered. The general width of the section is something over 100 miles, and the land surface about 40,000 square miles. The general substratum of the whole country is a hard granite, reached at a very little distance below the surface, though in many places are wide expanses of alluvial soil, which seem to have been formed by the deposits of rivers. The land generally rises abruptly from the water's edge, and is piled up in ridges and mountains, broken only where the numerous and narrow water-ways cut through. On the mountain-sides the only soil that is found is a spongy mass that seems to have been generated of the vegetable deposits of centuries past, and holds in its network the debris of the forests that have reached their growth and tumbled into decay and now lie entangled in every stage of decomposition, making traveling very difficult. All the mountain-sides are covered still with a dense growth of timber. This extends to an altitude of from 1500 to 2000 feet, and the peaks which rise above are bare of vegetation, except the moss. The shores are very rocky and the inlets deep.

The slate formation is found almost everywhere and ledges are found in many places, though but few have been developed. At Silver Bay, near Sitka, a gold-mining company began work about nine years ago, and after putting up a mill, failed. Near by, however, a Wisconsin company is at work developing. On Douglas island is the big mill of the Alaska Mining and Milling Co., turning out about \$70,000 a month. They have both water and steam power, and are well equipped. This is a San Francisco company. At Silver Bay basin, on the mountain three miles above Juneau, is a placer district, which has been worked since 1881. By way of Wrangel, in Southeastern Alaska, is the only accessible approach to the Cassiar mines. There are placer mines at the Junach river, in the extreme south, and at the Shuck and Sum-Dum, near Juneau. For several years past parties have penetrated the interior from the head of Chilcat inlet and prospected along the headwaters of the Yukon river. Gold has been found there, and this spring there was quite an excitement about the placers. There is much country yet to be prospected.

There is no means of getting about Alaska except in canoes. There are no railroads or wagon-roads and very few trails. But there are numerous rivers and streams, and transportation is all by canoes. Prospecting is difficult and laborious. For the work of prospecting, a boat or canoe is the first necessity, and it should have a good sail and be fitted with the means of securing goods against rain and wave. Besides a boat, a good hut large enough to shelter the entire party should be provided. Bear-skins are used to protect the

body from the dampness of the ground. After this a stout rain-coat and gum-boots come next, and the remainder of the outfit, as to tools, provisions, etc., can be according to preference and means. There are few stations, so plenty of grub must be provided. There is plenty of rain, and mosquitoes are abundant and annoying. The density of the forest growth, the tangle of underbrush, and the thick carpet of moss that covers every inch of ground, has made prospecting slow and difficult. It is hard to clear even a patch of ground to get at rocks. Croppings must be held to be seen at all. It is no wonder, under the circumstances, that de-

Hand-Drilling.

There are many forms of hits used in pointing drills for mining. Figs. 1 and 2 of the accompanying cuts show the curved chisel-bit in ordinary use, which has been proved by the experience of hundreds of years to be the best for ordinary hand-drilling. Mr. Henry S. Drinker in his work on "Tunneling, Explosive Compounds and Rock Drills" (from which we take these figures) considers this form of hit carefully and explains why it is so effective.

Take a purely straight-edge hit as shown in Fig. 5 and consider that in Fig. 3 the white lines

FORMS OF POINTS OF MINING DRILLS.

velopments have been so slow in Alaska. Few people have gone any distance away from the water-courses, owing to the difficulties mentioned. The season for mining is comparatively short, and in the interior it is very hot indeed in summer and cold in winter. On the coast the winter is not severe. The rainfall all over the country is generally very large, and moisture and dampness prevail in ground and atmosphere.

PAY-ROLLS of the Comstock mines last month amounted to \$220,000. The largest single amount was that of Cons. Cal. and Virginia—\$44,000. Confidence paid \$1700 and Hale & Norcross \$12,000. The Carson river mills paid out \$15,000 for labor.

At Eureka the Richmond mine has closed down and will not resume operations for many months. The Eureka Con. mine and furnaces are running steadily.

show successive cuts made by it in turning. Theoretically, the drill is turned on a center in the middle of the hole; practically the successive cuts cross each other a little as shown in Fig. 4, the hole being necessarily broken a little wider in diameter than the extreme middle of the hit. In either case we see how vastly more work the drill has to do at the circumference of the circle than at the center, and therefore a straight-edged drill, as in Fig. 5, will soon be worn more at the ends (Fig. 7) than the middle of the edge, and it will naturally approximate to the curved edge, which, if originally adopted, therefore gives the most uniform wear.

There are also considerations affecting the form of the edge. Theoretically speaking, the drill is always supposed to be held vertically in the hole and the blow is further supposed to be given directly on the head of the drill, the axis of the hammer at the moment of impact being perpendicular to the axis of the drill.

In practice, however, the drill may be often held at a slight angle as in Fig. 6, and the blow is, besides, often given in axially as in Fig. 8; these results also tend to a rounding of the straight edge, if used as in Fig. 6. Fig. 9 shows that with a rounded edge an inaxial blow will take effect nevertheless on the body and not on the end of the edge; in other words, the more the edge is curved, the more nearly will inaxial blows take effect at the center, and the practical mean to be reached is on the one somewhere here between a flat edge and a diamond point; the amount of curvature as well as in the tempering of the steel must be adapted in each case to the material to be drilled. Thus, in hard ground a flatter curve and in easier ground a sharper curve will be found best, varying perhaps from Fig. 10 to Fig. 11.

It has, in fact, been found by experience, says Mr. Drinker, that: (a) Straight-edged drills blunt quickly at the corners; (b) Edges with too sharp a curve blunt first at the center; (c) Edges with light curves are best adapted to hard, and those with sharp curves to easier ground; (d) The proportion of the extreme width of the hit to the diameter of the drill may vary from 7:6 to 4:3. In easy rock the shoulder of the edge need not be so great as in hard, as the ends are not subjected to so great a strain. (e) The angle of the two faces may be put, at the highest for strong drills in hard work, at say 70° as in Fig. 12. In hard ground, however, the drill should be rather rounded, as in Fig. 13, to give support to the point, and in very easy material (hard earth, etc.), where a crushing rather than a cutting edge is needed, it is well to slightly blunt the edge, as in Fig. 14.

TIMBER AND MINERAL LANDS.—A civil suit is to be commenced against the Eureka Con. Mining Company, operating in Nevada, to recover \$3,670,741. The sum, it is alleged, represents the value of charcoal and cordwood manufactured from cedar, pine and mahogany timber unlawfully cut from public mineral lands in Nevada by or with the guilty knowledge of the Eureka Company. Criminal proceedings are recommended against Henry and Donnelly, superintendents of the company's mines. These recommendations are made upon a report by Special Agent George D. Temple, who has just concluded his investigation of alleged timber depredations in Nevada. The commissioners admit that it was lawful to cut timber from public mineral lands for mining purposes, but asserts that the company has violated the law respecting the protection of young trees and has ignored certain rules prescribed by the General Land Office. Hence he recommends the suits as stated.

ACADEMY OF SCIENCES.—At the last meeting of the Academy, donations to the cabinet of curious shells were received from W. S. Wood, and of stone axes, spear-heads, knife-sharpening stone, earthen pots, of bone needles and hooks found at Los Muertos from Professor Frank Cushing. The librarian reported that since the last meeting 164 books had been added to the library, 21 by donation, 143 from correspondents. Frank H. Vasil was proposed for membership. A communication was received from Professor E. S. Holden of the Lick Observatory, inclosing a paper relating to observations he had recently made in regard to active volcanoes in the moon. F. Gutzkow gave an explanation of the manufacture of magnesia from sea-water.

CLARENCE COULTER returned from Sitka during the week, and made so favorable a report of the Takou mine that his father, Samuel Coulter, purchased it for \$45,000, George Harris of Seattle taking one-third. The owners propose stocking the mine and erecting a ten-stamp mill. Clarence and his family leave immediately for Juneau, Alaska. These gentlemen are interested in the Swinden mine near Gold Hill.—*Jacksonville (Oregon) Times*.

OWING to the scarcity of water in the Carson river, nearly all the mills have shut down for the summer, the consequence being that hundreds of Comstock miners have been thrown out of work. One hundred men were drafted from the Yellow Jacket recently, and several hundred from other mines were also laid off.

A REPRESENTATIVE of Denver, Colorado, ore-buyers is visiting Nevada mining towns with a view of contracting for ore to be shipped to Denver.

MECHANICAL PROGRESS.

Further Improvement in Basic Steel.

London *Iron* of July 13th gives the particulars of another important improvement in the method of production of basic Siemens steel, which has just been put in operation at the Staffordshire Steel & Ingot Company's works at South Staffordshire. We condense the same as follows:

This improvement effect increased economy and increased efficiency in working. The new furnace has just been started, with the most excellent results, while an important advance in the method of manufacture has been accomplished. The old furnace, which was round, has been superseded by a rectangular furnace with rounded ends, so that the flame, being longer, does not seem to have such a destructive cutting power upon the lining and upon the gas and air ports. The internal dimensions of the furnace are 16 feet 6 inches length by 10 feet 6 inches wide, and will produce a cast of 9 tons 10 cwt. of ingot metal. The roof and part of the internal side-walls are built of silica bricks, and the bottom is lined with basic bricks separated from the silica work with a chromic brick. This basic bricks are of exceptional density, being made by a new machine of German manufacture, which exerts a pressure of 4500 pounds upon the square inch.

Another important alteration is that the roof, instead of being movable, as before, is fixed. The movable roof was designed to enable repairs to the interior of the furnace being the more easily made, but in practice it has been found that this advantage was more than lost by the destruction which ensued to the roof by removals. Silica brickwork, it has been found, will not stand intermittent heat, since the cooling and subsequent reheating, after first being subjected to intense heat, renders it very frail and brittle. The expansion of the silica work under heat is so great that, to preserve it intact, it must be kept at one uniform temperature or thereabout. Another improvement is, that instead of being provided with only one door in the front for charging and testing purposes, the furnace is furnished with three doors in the front, and one at the back over the tapping-hole, which renders the working much easier and more convenient.

The regenerative arrangements connected with the furnace show even greater improvement than the furnace itself. Previously, the two air and two gas regenerators were of circular shape, and were entirely independent of each other to prevent the air and gas mixing. It has now been found that this object can be secured, and considerably over 100 per cent more regenerative capacity obtained in the same space, by making the regenerators, like the furnace, rectangular, with rounded ends. Where, before, the regenerative flue heated 4000 bricks, it now heats 10,000. The diameter of the gas regenerator before was 5 feet, and the air regenerator 5 feet 6 inches; now each is 8 feet 6 inches in diameter by 9 feet long. Instead of being independent of each other, they are now connected by wrought-iron plates, which arrangement both economizes room and gives a larger regenerative area, and any mixing of the two elements is prevented by the erection between the regenerators of a firebrick wall 20 inches thick, with 3 inches of sand space.

The economy which results from this alteration in the form of the regenerators is remarkable. With the short furnace previously at work, some of the heat passed into the chimney, and was lost, but the longer flues now possible absorb the entire heat from the furnace, besides which it is possible to work with less gas while obtaining a greater amount of heat. A greater production of ingots with a lessened production of coal is now effected. Where before the coal consumption was 25 cwt. or more per ton of ingots produced, it is now only 14 or 15 cwt., and it is expected that this will be further reduced. The air and gas enter the furnace at an immense heat, and where combustion takes place the heat is approximately estimated at close on 4000° F. An important economy in the materials charged has been effected by the substitution for heat Spanish ore and scrap of basic cinder, produced at the mill-reheating furnaces. To produce a cast of 9 tons 10 cwt. of ingots, the charge consists of 10 tons 10 cwt. of basic pig, 15 cwt. of cinder and 15 or 16 cwt. of line. This can be melted down in 2½ hours, and the metal is ready for tapping in the remarkably short time of 7½ hours from the time of charging. The management hope that they may be able to run 100 charges before the furnace wants relining, though it is yet too soon to pronounce definitely. The new furnace will add to the ordinary basic output of the works some 120 tons per week.

SPIRALLY WELDED STEAM PIPE appears to be fast coming into use at the East. These pipes are made by winding steel or iron spirally and hammer-welding the overlapping edges. They are made of any desired weight of metal, of diameter above three inches up to as high as 48 inches, and of any length that can be transported. They are proved to be safe under all pressures which standard wrought-iron tubing of corresponding diameters will carry, and are adapted to all uses for which metal pipes are employed; they possess conspicuous utility and combine great strength and perfection of workmanship with an economy in material hitherto

regarded as impossible in the production of pressure pipe. In the matter of durability they are warranted to be at least equal to any other pipe of similar quality. Spirally welded steel and iron tubing enters the market as a practical competitor of wrought iron and cast iron pipes of corresponding diameters for any use for which they are not adapted. It is claimed to be a cheaper pipe than either lap-welded wrought iron or cast iron, and is as much better than any form of riveted pipe as a perfect hammer weld is better than a line of rivets. It is of uniform strength and of full inside diameter. Freight and labor charges are large items in the cost of pipes ready for use. The lightest of the pressure pipes hitherto offered have entailed formidable freight charges if moved any distance, and the labor of handling and connecting them has further swelled the total, until in many cases the cost of the pipe at the mill has been doubled or trebled before it came into use. Lightness, if attained without the sacrifice of strength, is a quality which all consumers will appreciate. The comparative weights per foot of spirally-welded pipes of different gauges, lap-welded pipes and cast-iron pipes, will show the advantage of the former in transportation and handling.

Does Machinery Wear Out?

It hardly seems possible that machinery, such as is constructed to-day, of the best material and by careful workmen, should ever wear out, and it is quite safe to assert that it never does; it simply becomes out of style, and the rapid progress of the times makes its discarding or replacement by new and improved machinery necessary, in order that the manufacturer may keep pace with the times and be able to enter into the market with his goods against the competition that such machinery creates.

It is a matter of some wonder, at first sight, as to what becomes of all the new machinery that is being made and put upon the market by the ever-increasing number of manufacturers, who are yet unable to keep up with the demand for their products. A shop or factory, fitted up with new machinery, might be supposed to last for years without replenishing, except in the matter of ordinary repairs, and it is hardly possible to suppose that there are enough new enterprises started up to employ all the machinery that is being turned out.

This is an age of progression and competition, and in order to keep up with the times and stand an equal chance with others in the race, it is necessary for a man to be constantly discarding the old and adding the later and more improved styles of machinery. The machines are not worn out, but have gone out of style, and their employment is continued only at a sacrifice.

The one great object of the present time is to save money on the part of the purchaser by buying where it can be done the cheapest, and on the part of the manufacturer to produce and put on the market his goods as cheaply as possible, and at the same time with as much profit to himself as can be made. In order to do this, all the skill and ingenuity of modern Yankeeism are called into service, and inventions and contrivances innumerable are brought out and offered to the trade, who ever watching for such improvements as offer any advantage in quality, quantity, or profit in manufacture, and when such a thing is shown to be a success it becomes a necessity, and when once adopted must be generally utilized, or failure so to do is sure to bring disaster and ruin.

The old machines are discarded or replaced by the new in the eager pursuit of increased facilities and wealth.

This, then, is the answer to the query above. Machinery does not wear out, and it is not this fact that makes the demand for new and improved implements, and furnishes the scores of factories with work in their construction. It is one of the marks of our progressive age, and not the demand, which furnishes the material for the above article.—*Practical Mechanic.*

A PETROLEUM ENGINE is now being exhibited in England and is attracting a great deal of attention. The petroleum is placed in a tank in the bed of the engine and is forced through a pipe into an apartment where a blast of air turns it into a fine spray. A small battery in the rear supplies an electric spark, and the spray coming in contact with this electric spark furnishes the motive power. This engine is said to be very simply constructed and works with admirable regularity. The piston needs no oiling, the petroleum vapor filling this necessity.

PALLADIUM, a metal of the platinum group, but of a far lower density than the latter, may be substituted for steel in the manufacture of watches. Palladium is absolutely non-polishable, and it is unaffected by any noticeable extent by the presence of a magnetic field. Besides this, it has the incidental advantage of being rust-proof. This discovery is due to C. A. Pallard of Geneva, Switzerland, and watches are now being constructed there of this metal.

COMPOUND AIR-POWER IN PARIS.—The length of pipe laid in Paris for the distribution of power by compressed air already exceeds 30 miles. The compressing engines are of 3000 horse-power, and about 3,000,000 cubic feet of air are compressed daily to a pressure of 80 pounds per square inch, at an expenditure of 50 tons of coal.

SCIENTIFIC PROGRESS.

The Magnet.

The natural magnet or loadstone is an ore of iron, every molecule of which is composed of three atoms of iron, combined with four atoms of oxygen gas. This loadstone has the power of attracting small pieces of iron, and, if balanced and suspended will point nearly north and south.

Artificial magnets are pieces of iron or steel which have been under the action of either the loadstone or other magnets, or of an electric current, or have been subjected to percussions while in certain positions.

Permanent magnets are those which retain their magnetic properties permanently. They are made of hard steel, in bars, or bent in the form of a horseshoe.

Temporary magnets are those which retain their magnetic properties only as long as they are under the influence of other magnets or an electric current. They are bars of soft iron, either straight or bent like a horseshoe.

The poles of a magnet are the two points of greatest attraction and repulsion. They are at the two ends.

Magnetic polarity.—Balance a horseshoe magnet by tying a thread around its middle and suspend it. It comes to rest nearly north and south. Call the end pointing north the north-seeking pole, and the south the south-seeking pole. Take a strip of steel which has been rendered magnetic by discharging a Leyden battery across it, and suspend in like manner. It will also come to rest nearly north and south. Place a strip of cardboard over a horseshoe magnet lying on a table. Scatter iron filings all over the cardboard and tap it. Notice the curves of the poles. Move the magnet under the cardboard and the filings will move like a lot of insects.

Take a strip of steel, and draw it from end to end over a strong magnet. The strip of steel becomes a magnet. Balance and suspend it by a thread, and do the same with a horseshoe magnet. Bring the north-seeking end of the horseshoe, and it will be repelled. Again, bring the north-seeking end of the strip to the south-seeking end of the horseshoe. Attraction will now take place. This shows that unlike poles attract, and like poles repel one another.

Heat red-hot an iron ball, and suspend it by a thread. Bring a pole of a powerful magnet near to the ball, and the latter will not be attracted. Keeping the magnet in the same position, wait until the ball has cooled, and when sufficiently reduced in temperature it will be attracted. This shows that, when red-hot, iron cannot be magnetized.

How to make an electro (temporary) magnet out of a horseshoe of soft iron. Take a piece of insulated copper wire and coil it around one of the arms of a horseshoe of soft iron in a left-handed helix. After making doubly by coiling in the same direction, pass over to the other arm and coil the wire in a left-handed helix backward and forward once. Connect the ends of each wire with the two plates of an electric battery, and the horseshoe will become a strong magnet.

Sunspots and Temperature.

A careful study of the solar orb by astronomers has developed the fact that there is a period or cycle of 11 years in the presentation of those phenomena on its surface known as sunspots. All scientists agree that the greater the development of these mysterious spots on the luminous envelope of the sun, or photosphere as it is technically called, the greater the activity underneath the envelope, and the greater the activity of the sun, so much the greater the heat that is thrown off. Those years, therefore, when the greater number of spots are visible on the sun's face are periods of extraordinary physical disturbances in that body, and the seasons are accordingly usually notable for a prevalence of high temperatures. On the contrary, when the sun is in a state of repose, or the minimum of the 11-year cycle has been reached, low temperatures are the rule.

The year 1857 was the end of an 11-year cycle, and the sun was notable for the scarcity of spots which presented themselves. Some scientists now associate the intense cold of last winter to the absence of sunspots during the previous summer, which was accepted as evidence that the sun was in a state of repose and throwing off the minimum amount of heat. As a matter of fact, the winter was one of the severest on record throughout the Northern Hemisphere. The memory of the blizzards in many of the Western States is still fresh in the minds of the public. Many fatalities occurred in these States and in some of the European countries through the severity of the cold. Even in California the thermometer reached a point lower than any before recorded.

The close of this sunspot cycle, assuming that the low temperatures of last winter were the manifestation of it, has been of some value to this State. For example: It has afforded through the experience of the South of France, whose climate has been frequently likened to that of California, an opportunity of making some interesting comparisons. The South of France, in common with Northern Europe, was visited during the winter by a period of unusually low temperatures, and many of the more tender kinds of vegetable growths were subjected to very severe tests. It appears

that many plants which have never suffered severely from frost in California were killed in the South of France by the cold last winter. Among them were several varieties of eucalypti, and specimens of California redwood and sequoia, which were killed outright by the frost. Some varieties of eucalypti survived the winter without injury, showing their adaptability for cultivation within the frost line in the temperate zone. In California the heaviest frost on record merely scorched the leaves of the tenderest varieties of the eucalypti, but neither the magnificent forests of redwood along the coast ranges nor the Sierra groves of sequoia suffered in the slightest degree. These are positive illustrations of the fact that the climate of California is milder than that of the South of France, and that whatever can be grown in that favored region is sure to succeed quite as well if not better here. If these sunspot cycles have no other value, then, than that of furnishing opportunities for making climatic comparisons, they are of much interest to California, and their progression and effect may be observed with considerable profit.—*Exchange.*

THE OSCILLATIONS OF HIGH CHIMNEYS.—In the *Memoires de la Société des Ingenieurs Civils* some particulars are given of the oscillations of a chimney-stack near Marseilles, 35 meters (115 feet) high, with an exterior diameter at the top of 1.22 meter (four feet). During a severe storm it was determined, by observing the shadow of the chimney, that its greatest oscillation was half a meter (nearly 1 foot 8 inches). It was further observed that a chimney set in motion by a gust of wind oscillates from four to five times backward and forward until it is at rest again. M. E. Burg asserts that, should this momentum during the oscillations of a chimney repeat itself in such a manner that its direction coincides with that of the oscillation, the overthrow of the chimney may be expected. This is the explanation given for the destruction of many a chimney constructed in accordance with sound principles of stability. The *Oesterreichische Zeitschrift für Berg und Hüttenwesen* adds to this statement the qualification, that in the case of a chimney near Vienna 50 meters (164 feet) high, and constructed of concentric (hollow) rings, with an inner diameter at the top of two meters (6½ feet), which is exposed to considerable gusts of wind, the oscillations were most carefully and repeatedly measured with a theodolite, when the observations showed an extreme oscillation of only 16 centimeters (6½ inches) during severe storms.

RECORDING MOVEMENTS AUTOMATICALLY.—In the very useful scientific methods whereby movements record themselves in curves automatically by a point moving on a smoked surface are, perhaps, those which yield the most delicate curves. In the French Sociétés d'Encouragement, M. Mascart has called attention to a useful modification by M. Fenon, in which a bent tube of tempered steel forms a siphon dipping at one end in a reservoir of ink and at the other being shaped like a pen-point, which is brought near the moving paper (the sloped section outward). Capillary force prevents outflow when the apparatus is at rest. A fine trace is produced by this pen, without interruption by the most rapid displacements and without sticking when at rest. M. Wolf of the Paris observatory has used the system for getting records of air pressure, temperature, wind, etc., with the best results. The reservoir needs charging only once a week, and, using inks mixed with glycerine, a single charge has been found to suffice for a barometer record of more than six months.

ORIGIN AND CHARACTER OF METEORITES.—From an exhaustive study of the very large collection of meteorites at Harvard College, the conclusion has been arrived at that many of the masses of meteoric iron now known are cleavage crystals, broken off, probably, by the impact of the mass against the atmosphere. It is found that these masses show cleavages parallel to the plane of all three fundamental forms of isometric or regular system. From all that appears, the theory has come to be entertained, in respect to the origin of meteorites, that the masses were thrown off from a sun among the fixed stars, and that they were slowly cooled while revolving in a zone of intense heat.

INFLUENCE OF FORESTS ON MOISTURE.—President Willits of the Agricultural College of Michigan, while he disputes the exercise of a direct influence of forests in promoting moisture—saying that all the trees in the world will not put it where it is not—believes that the moisture on the continent is advancing toward the west, and that the planting of forests and increased cultivation will cause the rainfall to advance farther west every year. Seven hundred thousand acres of forest have already been planted in Nebraska—the cottonwood and the willow first, and then the soft maple and the hard woods.

STRYCHNINE FOR DRUNKENNESS.—A Russian physician declares that strychnine is an infallible cure for drunkenness, administered in subcutaneous injections. The effect of the strychnine solution is to change the craving for drink into positive aversion, and this change is effected in a day. After a treatment of eight or ten days the patient may be discharged. The strychnine is administered by dissolving one grain in 200 drops of water, and injecting five drops of the solution every 24 hours.

GOOD HEALTH.

Breathing in Smoke.

An exhibition was recently given in Westminster, near London, England, of Loeb's appliances, says *London Engineer*, which are designed to enable the wearer to breathe and work with comfort in dense smoke, and also in poisonous gases. The appliance consists of a respirator with an india-rubber mouthpiece. The respirator is held by two projections, which are grasped between the teeth and a flange, which lies between the teeth and the lips, additional security being provided by an elastic band passing round the head. The air is drawn in by the wearer through a series of small filters, containing respectively wet sponge, cotton wool, cotton wool damped with glycerine, and animal charcoal. These filters are very lightly packed, so that there is no resistance to the act of inspiration, and they are provided with valves which direct the air expired from the lungs into the external atmosphere. The entire apparatus weighs less than a pound, and can be used without previous practice. When it is to be employed in an atmosphere which is deadly in its character, as in the choked camp of mines, the air is drawn from some place where it is pure, through a light india-rubber tube. The filter is then strapped to the waist of the wearer, and the respirator merely contains the valves which cause the air to be drawn through the pipe and then to expire into the atmosphere. A tube up to 100 feet in length can be used with facility. Protection is afforded to the eyes by a pair of spectacles with india-rubber rims, which press tightly on the cheek and brow, and exclude all smoke. Mechanical wipers are added, to enable the glasses to be cleaned without removal. A man wearing the respirator spent half an hour in a building filled with dense smoke of a most pungent character, without any difficulty, and afterward the inventor's representative, with the aid of a flexible air pipe, entered a room containing a dish of burning sulphur and remained there some time. It was clearly demonstrated that the respirator would enable the wearer to enter a building filled with smoke and discover the exact position of a fire. A few buckets of water promptly applied under such circumstances will do more good than the jet from a steam fire engine directed at random. On board ship, where the result of a fire is to fill the hold with smoke, this respirator would be most useful, and this fact has been recognized in the German navy, where Loeb's respirators form part of the official equipment. Many of the German fire brigades have also adopted them. They are being introduced into this country by the Fire and Mining Appliances Syndicate, of 49 Queen Victoria street, E. C.

Care of a Cold.

A cold is a departure from health, and should really be attended to at once. Do not let it cure itself. Get rid of it soon. Do not feed it, though, but starve it. One cold after another nearly always ends in the thickening of the mucous membrane of the bronchial tubes, and before you are aware of it you become the victim of winter cough.

The morning thill (cold, I mean) is a very sure preventive of colds. Never overclothe or overheat yourself. The neck should be kept cool. Keep away from fire indoors if you are subject to colds.

Cough, if not the result of simple laryngeal or bronchial catarrh, may mean a very serious departure from health; and the sooner one sees a doctor in such a case the better. Do not be afraid to consult him. Remember, it is only those that delay who suffer in the end. I do not advise you to rush away to a physician with every trifling ailment, but—it is better to be sure than sorry.

Many people would benefit much by taking codliver oil for a month or six weeks about the change of the season. Probably the diet would have to be lowered a little, and an occasional mild aperient taken.

Getting thin is another serious departure from health. One generally does lose weight in winter and regain it in summer; but a slow and steady decrease in weight calls aloud for medical interference.

Want of sleep and restless nights are symptoms which cannot be overlooked. The cause must be found and removed. The trouble may certainly arise from overwork and worry combined, but in most cases the stomach and digestive system are the roots of the evil.

Nervous people worry most, but they also work most. Well, the question one is inclined to ask himself when he feels something wrong with his health is: "Am I overworking myself?" I would answer thus: If you really enjoy working, it cannot injure you very much; but, on the other hand, if it is forced work, and you find little pleasure in it, then it will tell on your constitution.

But many people cannot afford rest. Well, but wonder can he done by taking exercise; by breathing only fresh air night and day, indoors and out; and by careful regulation of the diet. In conclusion, let me entreat of you, as you value your happiness, not to neglect first departures from health. The story of the reservoir has really a moral for every one of us.—*Cassell's Family Magazine*.

SMOKING AND DIGESTION.—It is very unusual to find in a great smoker a healthy appetite for

plain food, and medical opinions may be had in any number as to dyspepsia caused by smoking. To whatever degree the habit affects the nervous organization, it appears to be certain that the process which is regarded as soothing is really destructive. Sir Benjamin Brodie must have known what he was writing about when he declared that "the poison of tobacco acts by destroying the function of the brain." In a Russian hospital in 1886 a Dr. Chadnowski took the liberty of examining by means of a pump the digestive powers of six smokers and as many non-smoking soldiers, and he recorded that "in the former the time required for digestion averaged seven hours, while in the case of the non-smokers the mean period of digestion was only six hours." With the present enormous consumption of tobacco the social consequences, apart from those concerning the bodily and mental powers of the consumers, are important.

HEIGHT OF SOLDIERS.—It has generally been believed that the reduction in the average height of French soldiers which followed Napoleon's wars, due, of course, to the immense slaughter in those campaigns, made all of those soldiers the shortest in Europe. But, according to a high medical and military authority in Russia, the minimum height of the Russian and French conscript is about five feet, while in most other European countries the minimum ranges from five feet one inch to five feet three inches.

HOW TO GROW OLD GRACEFULLY.—Activity without overwork, healthful living, moderation, self-control, the due exercise of all the faculties, the cultivation of the reason, the judgment, and the will, the nurture of all kindly feelings, and the practice of doing good—all things, in fact, which tend to build up a noble manhood—also prepare the way to a long life and a happy, blessed and graceful old age.

USEFUL INFORMATION.

HOW CELLULOSE IS MADE.—Most celluloid is made in France. A roll of paper is slowly unwound, and at the same time is saturated with a mixture of five parts of sulphuric and two parts of nitric acid, which falls upon the paper in a fine spray. This changes the cellulose of the paper into pyroxyline (gun-cotton). The excess of the acid having been expelled by pressure, the paper is washed with plenty of water until all traces of acid have been removed. It is then reduced to a pulp, and passes on to the bleaching trough. It is this gun-cotton which gives it its explosive nature. Most of the water having been got rid of by means of a strainer, the pulp is mixed with from 20 to 40 per cent of its weight of camphor, and the mixture thoroughly triturated under millstones. The necessary coloring having been added in the form of powder, a second mixture and grinding follows. This pulp is spread out in thin slabs, which are squeezed in a hydraulic press until they are dry as chips. Then they are rolled in heated rollers, and come out in elastic sheets. They are from that point worked up into every conceivable form. One can get celluloid collars, cuffs, hairpins, shirt-fronts, cravats, pen-holders, brushes and combs, inkstands, knife-handles, jewelry, and everything else almost that you can imagine. In Paris there is a room almost completely furnished in celluloid. The curtains, the furniture, the door-knobs, and even the matting were made of this material. To be sure, no matches were ever carried there. Indeed, the room was never used. It was only a curiosity, and the man who owned it owned the factory where it was made. These rooms will never be popular. Few men, even in this rapid age, care about being blown into the kingdom come in small fragments, scorched and scattered, and that would be the fate of a man who let a lighted match fall in such a room.

KEEPING COPPER PLATES CLEAN.—Louis Blanding, the metallurgist, has after many years of experimentation succeeded in accomplishing what may be regarded as one of the most important discoveries in all the broad range of metallurgical science. It is well known to all mining and mill men that it is most difficult even after they have been in use a considerable time to prevent the copper plates of batteries from oxidizing. Many solutions more or less acidulous have been applied to the plates, but hitherto with only negative success. The plates must be kept in a perfect condition of amalgamation to insure their retention of the gold, or amalgam, after coming from the batteries. The green spots commonly called *Verdigris*, but which are really oxide of copper, are fatal to amalgamation. Mr. Blanding's process consists of a chemical solution which coats very little, is easy of application, and most readily and positively effective. The green places in the copper are immediately deoxidized and at once receive the quicksilver. He intends to make application for letters patent for his discovery.—*Tuolumne Democrat*.

HOW TO SKIN AN EEL.—Skinning an eel is not a very easy thing to do, when one doesn't know how, but it is very easy if performed in the following manner: Make a cut around the neck, just back of the gills, through the skin; then another cut at right angles with the first one, two inches long; turn the corners and the rest of the skin up, like your shirt-sleeve, take a

dry cloth in the right hand and catch hold of the turned-up skin; with the left hand grasp the eel's head, then take a long breath, pull, and then wonder how nicely it comes off.

UTAH AND ITS RESOURCES.—The population of Utah is now about 200,000. Of this number about 55,000 are Gentiles. The Mormons follow agriculture mainly as a means of livelihood, while the Gentiles are largely engaged in mining, trade and the practice of the professions. The territory is 325 miles in length by 300 miles in breadth, and it consists of a succession of rugged mountains holding in their arms fertile valleys, some of great extent. The assessed valuation of the Territory, not including the mines, is about \$35,000,000, and of this amount the Mormons own about 60 per cent, the Gentiles 30 per cent, and the remainder is the property of railroads. Of the resources of the country, Judge Powers of Salt Lake City speaks with enthusiasm. He says: "We have pure alabaster, fine Carrara marble, magnificent granite, elegant brownstone and white sandstone right at our doors. We have 100 square miles of coal fields, mountains of copper and more mountains of iron. We have great beds of sulphur that range in purity from 45 to 99 per cent. We have two saltwater mines, the only ones in North America; lakes of horax, wells of petroleum and mines of rock salt. In addition we can manufacture pure salt for \$1.50 per ton from the Great Salt Lake. Salt Lake City has a population of 35,000."

A NEW FLAMELESS EXPLOSIVE.—Our English contemporary *Iron* gives an account of some tests of another new flameless explosive, for use in coal mines, called "Securite." It is the invention of Herr Schoenweg, and has been used in Germany for about two years past. "It is composed of a nitrated hydro-carbon in combination with certain oxidizing agents," which is rendered flameless by the addition of a certain proportion of an organic salt. It emits a spark in exploding, but this spark is harmless, not possessing sufficient energy to explode inflammable gases or coal-dust. By the action of the organic salt, the spark is almost instantly extinguished. In the tests mentioned, the flameless "securite" was exploded in vessels containing the most highly explosive mixture of gas and air, and, in some cases, this combined with coal-dust, but while gunpowder invariably causes their explosion, the flameless "securite" did not ignite the gas or the coal-dust, and it was demonstrated to be safe, even under more severe tests and conditions than are ever present in mining operations. One of the gentlemen making the tests gives it as his opinion that "flameless securite" is a most valuable blasting agent, and one which, if properly used, will give an assurance of practically absolute safety in mining work, so far as the communication of flame to the surrounding atmosphere is concerned.

A NEW SOLDER.—A soft alloy, which adheres so firmly to metallic, glass and porcelain surfaces that it can be used as a solder, and which is invaluable when the articles to be soldered are of such a nature that they cannot bear a high degree of temperature, consists of finely pulverized copper dust, which is obtained by shaking a solution of the sulphate of copper with granulated zinc. The temperature of the solution rises considerably, and the metallic copper is precipitated in the form of a brownish powder. Twenty, 30 or 36 parts of this copper dust, according to the hardness desired, are placed in a cast-iron or porcelain-lined mortar and well mixed with some sulphuric acid having a specific gravity of 1.85. Add to the paste thus formed 70 parts (by weight) of mercury, constantly stirring. When thoroughly mixed, the amalgam must be carefully rinsed in warm water to remove the acid, and then set aside to cool. In 10 or 12 hours it will be hard enough to scratch tin. When it is to be used it should be heated to a temperature of 375° C., when it becomes as soft as wax by kneading it in an iron mortar. In this ductile state it can be spread upon any surface, to which, as it cools and hardens, it adheres very tenaciously.—*Tradesman*.

BLOSSOMS ONCE IN FIFTY YEARS.—There was recently witnessed in the palmhouse at the Imperial Palace of Schonbrunn a spectacle which had previously been seen only once before in Europe—to wit, the palm tree *Brownia Ariza* in full bloom. This tree, which is named after the celebrated English hotaniat, arrived at Schonbrunn 40 years ago from London. It was then an insignificant sapling, but now it vies in magnitude with the Maria Theresa palmhouse. It blossoms only once in 50 years, and the bloom lasts only 48 hours. The last time the blossom of the *Brownia Ariza* was seen was in June, 1851, in the Duke of Norfolk's conservatory at Chiswick.

A BRAN PACKER.—A few persons are yet trying to invent a bran-packer that will be practical. The last heard from was in Gloucester, England. A great number of models and drawings of bran-packers have been filed in the office of the secretary of the Millers' National Association in Milwaukee, but none have as far been considered really worth putting on the market. The trouble seems to be not in packing in the required space, but in keeping it packed.

THE RUBBER TRUST doesn't work. In fact it has petered out, owing to the unwillingness of a large rubber manufacturer in New Jersey to enter the combination.

ENGINEERING NOTES.

THE PEREKOP CANAL.—The Russian Government has begun the work of cutting the Perekop canal, the original survey for which was made many years ago. This canal is to extend across the Isthmus of Perekop, connecting the Sea of Azof with the Black Sea. It will be 74 miles long, and the present expectation is that it will be completed in 1891. As with most Russian works, the main object is military, to enable war steamers to pass from the Sea of Azof to the dockyards and forts of Odessa without circumnavigating the Crimea or passing through the dangerous straits of Kertch; but the canal also has commercial importance. The bulk of the trade from the Don river and a great deal of that from the Upper Volga goes to Odessa, and the new canal will very much shorten the voyage for all the vessels engaged in this business, besides securing the further advantage that the grain barges employed on the Don will be enabled to carry their loads directly to Odessa without transshipment, the frequent storms on the Black Sea now making it necessary to transfer the loads of these barges to sea-going vessels at present. The canal presents no special engineering difficulties.

EIFFEL'S BIG TOWER is still progressing skyward, and already rivals in height the ancient Babel. The enormous mass of iron which the constructors have already piled up against the clouds is the amazement of everybody. When you stand at the base of the gigantic monument and look up to the skies through a colossal spider's web of red metal, the whole thing strikes you as being one of the most daring attempts since the biblical days when the real Babel was planned. Pessimistic people are predicting a fate for the new tower akin to that which befell the old one, but M. Eiffel is cheerfully sanguine, and his motto is evidently "Excelsior." It is gratifying to be able to state that the finance committee of the exhibition has in the meantime voted funds for the erection of a theater to be called the Folies Parisiennes. It will be managed by the amusing M. Danhray of the Palais Royal. This looks both like business and pleasure. Some enterprising person ought to improve upon this by constructing a pleasant garden in or near the Champ de Mars to replace—if only during the exhibition—the doomed Jardin de Paris.

THE GREAT CANALS OF THE WORLD.—The Imperial canal of China is over 1000 miles long. In the year 1861 was completed the greatest undertaking of the kind on the European continent, the Canal of Languedoc, or the Canal du Midi, to connect the Atlantic with the Mediterranean; its length is 148 miles, it has more than 100 locks and about 50 aqueducts, and its highest part is no less than 600 feet above the sea; it is navigable for vessels of upward of 100 tons. The largest ship canal in Europe is the great North Holland canal, completed in 1825—125 feet wide at the water surface, 31 feet wide at the bottom, and has a depth of 20 feet; it extends from Amsterdam to the Helder, 51 miles. The Caledonia canal, in Scotland, has a total length of 60 miles, including 3 lakes. The Suez canal is 88 miles long, of which 66 miles are actual canal. The Erie canal is 350½ miles long; the Ohio canal, Cleveland to Portsmouth, 332; the Miami and Erie, Cincinnati to Toledo, 291; the Wabash and Erie, Evansville to the Ohio line, 374.

THE LONGEST RAILROAD TANGENT.—The new Argentine-Pacific railroad, from Buenos Ayres to the foot of the Andes, has on it what is probably the longest tangent in the world. It is 211 miles without a curve. It is also a remarkable fact that in this distance there is not a single bridge and no opening larger than an ordinary culvert. The level nature of the country will be appreciated from the statement of the further fact that on the 211 miles there is no cut greater than 1 m. in depth and no fill of a height exceeding 1 m. The country, in fact, seems to be almost an ideal one for railroad construction. There are some drawbacks, however, one being that there is almost an entire absence of wood on the plain across which the western end of the road is located. This has led to the extensive use of metallic ties, which will be used on nearly the entire road. Work has already been begun on the mountain section of the road, which is to cross the Andes and unite with the Chilean line.

NEW AND IMPORTANT USE FOR DYNAMITE.—M. Bonnetoud, a French engineer, employs the explosive force of dynamite to drive out, for a brief period, the water from portions of wet ground in which foundations are to be made. A hole is bored in the wet ground 10 or 12 feet deep and about 1½ inches wide. By exploding cartridges of dynamite in this hole the water is driven far out beyond the sides of the yard-wide cavity which is produced, and does not reappear till after half an hour at least. The workmen then have time to clear the cavity and introduce quickly setting concrete.

THE CHICAGO RIVER SET ON FIRE.—A small boy did it. He threw a lighted match into the river near the stockyard which communicated its fire to the grease covering the water, and the efforts of the fire department only succeeded in subduing the flames after several thousand dollars damage was done to the docks.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

COSMOPOLITAN.—*Ledger*, Aug. 3: Last Monday we paid a visit to this promising property, on Dry creek, about 1½ miles from Plymouth. It has been operated for about a year past, by a company of Massachusetts capitalists. The Cosmopolitan Co. are bending their energies toward proving whether they have a mine or not. So far the prospecting operations have realized the most sanguine expectations. The shaft is 375 feet deep on the incline. The shaft is in a slaty formation, with small stringers of quartz running through it. Sinking is progressing at an average of two feet per day, working three shifts. It is probable that the large ore bodies met with in the many drifts will come together at a greater depth, forming one compact ore chimney of grand proportions. It is the intention of the company to sink to a depth of 550 feet, and run drifts at that depth in various directions.

MISCELLANEOUS.—The Zeile mill is running about 20 stamps. A number of men have been laid off while sinking operations are prosecuted. They are now putting in a tank at the 800 level, and when that is finished they will proceed to sinking. It is intended to go down 200 feet. It is reported that it ore is found to exist at this increased depth as in the levels above, important improvements will be made to facilitate the working of the mine, which will probably include the sinking of a new shaft. The Keystone mine at Amador City is turning out better than for some time past. The bullion output of last month was the heaviest for many months.

SUTTER CREEK.—*Cor. Amador Ledger*, Aug. 3: Sinking the shaft of the North Star is completed, it having attained a depth of 600 feet. There now remains a sump of 30 feet to be sunk, when crosscutting will be in order. It is likely that drifting will be carried on to a distance of several hundred feet each way, before the company will be satisfied as to the value of the claim. Sinking continues at the Wildman at a satisfactory rate. It is going down at an average rate of about two feet per day. S. D. R. Stewart is still working a few men on the Lincoln. They are now running an open cut to get to another dump.

EL DORADO.—The El Dorado mine, which was started up by C. B. Mayon, has come to a standstill. The roller-mill of the Bryant patent, which is owned by the Treasure-Box Co., was started on the rock, and we are told yielded excellent results during the short time it was in operation. T. Mayon has gone East, partly for the purpose of disposing of the property to capitalists there.

Calaveras.

THE MINING SITUATION.—*Calaveras Chronicle*, Aug. 4: Of late there have been few new mining ventures hereabouts worthy of note. The prospects of a short supply of water in the early part of the season, which at present are being realized, have had a tendency to discourage the commencement of operations in a number of cases. There are some heavy enterprises that promise development in the near future, but like all undertakings of magnitude they move slowly. Among these we do not include the Ilex, which ranks among the biggest mining ventures on the coast in the extent of its preparations with the encouraging outlook of a successful investment. In addition to the necessarily slow movement of enterprises involving large investments of capital, even under favorable circumstances, the season has operated as a discouragement to the commencement of actual work. In the southern portion of the county, in and about Angels' Camp, mining has been very active and with flattering results, but the scarcity of water in that section, too, is operating adversely to the interest, causing the cessation of work in some of the mines. Good reports come from quartz prospecting in the neighborhood of Sheep Ranch, besides the steady operation of the famous mine which called the town into existence. In the West Point country the principal mines are reported to be holding the even tenor of their way, with no striking developments to mention, while smaller prospects now and then show up encouraging finds. In the neighborhood of San Andreas we learn of several promising mines. In this immediate vicinity few are now active and fewer still will be working in a few weeks for want of the necessary motive-power, water.

THE EXCELSIOR CON. G. M. CO., organized and incorporated some time since, have made no move to open up their property, and will do nothing in that direction until water can be obtained. Their mine is on Tunnel ridge, and was formerly the Bonanza hydraulic claim, owned by S. S. Moser & Co. While working by the hydraulic process, what promises to be a valuable quartz vein was uncovered. Upon the discovery of the quartz vein, it was determined to follow up the prospect for quartz and if found to hold out to put the necessary works to operate in both quartz and gravel. The vein measures fully 20 feet in width, not of solid quartz, however, but consisting of a mixed formation which is easily mined and which prospects well throughout. The outlook for this enterprise is certainly flattering. The Quaker quartz mine near "the junction" has been running with encouraging results, but on account of the shortness of the water supply, we understand the mine will close to-morrow for the season. The What Cheer mine closed Friday, also, for want of water for running purposes.

TUNNEL CONTRACT.—*Mountain Echo*, Aug. 1: A contract has been let to run 200 feet of a tunnel on the London mine, owned by D. H. Jones and Jos. H. Reed, in Albany Flat district, and formerly known as the Antelope Trail claim.

CONFIDENCE.—Some of the ore recently extracted from the Confidence mine in this town assayed \$65 a ton in free gold, and the sulphurets yielded over \$1000 per ton.

UTICA.—*Angels Record*, Aug. 1: Work is being pushed rapidly at the Utica. The new hoisting works are as yet not quite finished, but will be so in the course of a few weeks.

WHITTLE.—The Whittle mine, under the management of the superintendent, Mr. Peters, is progressing rapidly and fast developing into valuable property. The Mitchell gravel mine, at Vallecito, is

progressing rapidly. Machinery has been put on and it will be in operation in a few days. There is no doubt but it will pay and infuse new life in Vallecito.

Inyo.

NEW FIND.—*Inyo Independent*, Aug. 4: Henry Galvin is taking out ore right along from his recent find near Independence station. The ledge is over 60 feet wide and contains several veins of lead ore that appear to be converging to a central ore body. Henry may find another Cerro Gordo in his claim.

DEFIANCE.—A body of ore was struck in the Defiance mine at Darwin some days ago. The extent of the body is not yet known.

Napa.

THE FIRST SILVER BRICK.—*Napa Register*, Aug. 3: There is an exhibition at Wells, Fargo & Co.'s express office in this city a Napa production that is calculated to convince the heretofore incredulous. It is thus described in the note that accompanies it: "This is the first silver bar taken from the first cleanup of the first pan in the mill of the Palisade mines. Not weighed or assayed. Probable value, \$1000." The Palisade has often been referred to in these columns. It is located a few miles above Calistoga, at the foot of Mt. St. Helena, and is the property of R. F. Grigsby and J. Johnson. No fuss has been made about the rich bodies of ore there uncovered, but for several years work has been going steadily forward and large sums of money have been expended on the development of the mine. A mill has been recently erected, and it is now operating daytime upon low-grade ore—the poorest of the mine—that yields about \$30 to the ton. When they get this mill to running day and night on the richer grades, plenty of which is on hand, then look out! There will be excitement at the head of Napa valley, and the days of '49 will have come again. The first brick, above referred to, was this morning put on the scales and it weighed 63 lbs. It is good to look upon.

Nevada.

GRAVEL AND QUARTZ.—*Cor. North San Juan Times*, Aug. 4: The old Manzanita, or American Hill, gravel lead is receiving more attention at present than has been accorded it for a number of years, in spite of the millions that have been abstracted from it. On the north side of Sugar Loaf ridge, near Monroe's vineyard, Ellison & Tremain are pushing in a tunnel for this channel. They have not worked in far enough to strike pay, but have got encouraging prospects so far as gone. Further west, and on the same side of the ridge, the Nebraska Co. is putting down a shaft near the old Nebraska incline, from which so much gold has been taken. The shaft has reached a depth of 80 feet and is now in sand. A neat little hoisting and pumping rig run by water-power removes the dirt and frees the workings from water. One hundred and seventy feet all told will reach bedrock, when, according to old miners who are acquainted with the ground, big results may be expected. Directly across, and on the south side of Sugar Loaf ridge, is located the Manzanita Co.'s claim. They have driven in a tunnel from the face of their old hydraulic diggings and obtained some very fine dirt. The Pennsylvania grounds, to the west of the above, were worked until recently by Wheeler & Bodie, who averaged about \$250 per day from a series of short tunnels run into the low banks thereon. Water finally necessitated a cessation of operations, the bedrock pitching rapidly into the hill at the time work was stopped. Adjoining this claim on the west is the Mullen patented ground, the owner of which is clearing out a tunnel thereon, preparatory to prospecting. Again to the west, and adjoining, are the works of the Hirschman & Grover Co. They have run a series of tunnels into the ridge from the former hydraulic washings and are taking out good ground. Their operations are somewhat retarded by the large boulders. Nothing new in the quartz line, outside of expected resumption of work at the old Banner mine in the near future. Quite a number of companies made up of from two to six men each are steadily prospecting some of the numerous ledges hereabout.

MEADOW LAKE.—*Truckee Republican*, Aug. 4: Mr. Oakley was in town to-day and gave some more information concerning the operations at Meadow Lake. He was there a few days ago and took notes of what was going on. There are 15 men employed at the mine and mill, and some more will be put on at once. The late cleanup was the result of a five-days' run, and 30 tons of rock were worked per day. This 150 tons of ore produced \$900, or at the rate of \$6 a ton. The cost of mining and milling the same was \$2 a ton, leaving a net profit of \$4 a ton. The process used is said to be very simple and inexpensive to operate. The mill has 10 stamps; no plates are used, but the crushings are run on a large canvas with longitudinal strips of wood fastened on it. The heavier material is removed from the canvas to a large tub where amalgamation takes place. It is claimed that all the gold is saved by this means. It will be noticed that the value of the ore is not large, but it is easily extracted and can be cheaply milled. This ought to insure a good and permanent camp at Meadow Lake.

WILL ENLARGE THE MILL.—*Tidings*, Aug. 6: A meeting of the directors of the North Banner Mining Co. was held Saturday afternoon, and it was determined to remove the present five-stamp mill to just below the mouth of the lower tunnel. Five stamps will be added to the mill's complement, making ten in all. An incline from surface to the upper tunnel has been opened and men are at work pushing a "raise" from the lower to the upper tunnel. When this work is completed, in about three weeks, there will be an incline 500 feet in depth. Down this water-pipe will be laid and in the lower tunnel a Pelton wheel and other machinery for pumping and hoisting will be placed, for the ledge has gone down and must be followed. In fact, it has been followed to a depth of 35 feet below the lower tunnel—which is 400 feet from surface—by aid of a windlass.

SUCCESSFUL ELEVATOR MINING.—*Nevada Transcript*, Aug. 1: Supt. Tully of the Omega gravel mine has for some time been experimenting in working that property by the elevator process, and his efforts have been thoroughly successful. The tailings are now raised a distance of 15 feet and conveyed to a worked-out portion of the claim, and it is believed they can be raised 35 feet with equal facility. The water when it finally passes off into the river is as clear as when it leaves the storage reservoir. Mr. Tully thinks the elevator system affords a prac-

tical and complete solution of the slickens problem wherever the extra amount of water required for carrying it on can be obtained at a reasonable cost.

DIDN'T PAY.—*North San Juan Times*, Aug. 4: A gentleman from French Corral the latter part of last week told us that the drift mine heretofore being operated there by the Milton Co. was to have been shut down Saturday evening last. The reason assigned was the unprofitableness of the venture. A bedrock tunnel was being run on this claim and between 10 and 12 men found employment in the diggings.

A MINING ENTERPRISE.—*Nevada Transcript*, Aug. 5: E. O. Tompkins has secured an interest in the Norway quartz mine on the north side of Canyon creek, eight miles from Grantville. He will leave here Tuesday with a force of workmen and proceed to develop the property, which is regarded as a most valuable one.

Shasta.

DEADWOOD.—*Redding Free Press*, Aug. 4: At Deadwood last week, seven tons of rock, from the Little Gem mine, yielded \$2000 in gold. At French Gulch the Niagara Mining Company cleaned up \$22,000 last month from the Old Shafter mine. Frank Wheeler, on Kline gulch, is still finding rich rock, and is well satisfied with the results he is obtaining.

RECENTLY DISCOVERED.—Connor & Fricke, who for the past year have been engaged in mining operations on the Sacramento river, opposite Middle creek, have recently discovered a fine body of ore, six feet wide, of sky-blue quartz containing particles of coarse gold. These gentlemen have met with considerable success, and on the dump of one of their mines have ore that will average from \$10 to \$16 per ton. Mr. Fricke is now running a tunnel to tap a ledge 75 feet from the surface.

THE LITTLE NELL.—*Courier*, Aug. 4: The great success of the Lost Confidence Milling and Reduction Works on Iron Mountain has given that district a genuine and solid boom, and there is demand for property all along the line. Oliver Boyd has contracted for the disposal of the Little Nell mine to Deputy Sheriff Buckbee of Sacramento, and he and Thomas B. Everett of El Dorado county, who will superintend the mine, were in town Tuesday, on their way up to the mine, on which vigorous work will be inaugurated. The mine is regarded by practical miners and good judges of ore as being very valuable.

LOWER SPRINGS.—*Cor. Shasta Courier*, Aug. 4: Lower Springs mines are becoming more favorably known as being in one of the richest quartz-mining camps in Northern California. It is a fact that Lower Springs can boast of having the most extensive surface prospects that can be found anywhere. This district has been very rich in placers and float gold quartz. There is every reason to believe that the ledges are extremely rich in places, and in course of a short time the whole camp will be thronged with miners. These are not wild goose assertions, but based on reason and sound judgment. Our surrounding camps, such as Dog Creek, Squaw Creek and others, of course, have big advantage over our Lower Springs mines. First, they have abundance of water-power; second, they have high mountains for tunneling, but the access to our mines here at home is much better than either of the Creek mines. If we had the same advantage for working ores as some of the creek camps have, there would be hundreds of tons of ore crushed daily here at home.

Sierra.

GOOD HOPE.—*Mountain Messenger*, Aug. 4: Arrangements have been completed whereby work has again been resumed on the Good Hope tunnel. Only a few hundred feet of tunnel remain to be run to reach the ledge, tapping it a long distance below the old workings, which were near the surface. When the last work was done by Hewson, just before the mill was burned, the rock paid exceedingly well, which we know by personal observation.

MILL.—There seems a fair prospect that a quartz-mill will be built on the Montpelier (old Wheeler) claim at no distant day. The largest owner in the property was here recently and was highly pleased with the outlook. Thos. Bessler and Albert Butler are running a tunnel to tap the old Sailor ledge some 80 feet lower than the workings.

Siakiyou.

PAYING.—*Yreka Union*, Aug. 2: The Steamboat mine on McAdam's creek is paying big. Messrs. Frank Riley and J. S. Clelland have bonded the McMann mining property on Humbag. The final cleanup in Hon. R. H. Campbell's mine in Quartz valley yielded 49 pounds of dust. Mr. M. Sleeper brought to Yreka Monday 75 ounces of dust from his Klamath river claim, near Honolulu. Mr. J. M. Haskell, one of the owners of the Steamboat mine, on McAdam's creek, passed through Yreka Saturday, en route for San Francisco, with a grip-sack full of gold bars. H. B. Warren's new four-stamp custom quartz-mill, situated on the flats above Yreka, has started up and is working satisfactorily. Steam-power is used and the mill superintended by H. B. Green.

Trinity.

THE EAST FORK COUNTRY.—*Redding Free Press*, Aug. 4: In conversation with A. McGregor we gleaned some valuable information regarding the mines of Trinity. Mr. McGregor speaks in high terms of the mines of East Fork, Yellow Jacket creek and Rattlesnake district. He investigated the coal deposits at Cox Bar, which has a vein of from 6 to 10 inches. It is bituminous coal and has been tested and proved as such. The Golden Chest mine is located 31 miles northwest of Weaverville, on the East Fork. The ledge averages 1½ feet wide and the ore 75 per ton. A five-stamp mill has been located on this property, run by an 80-foot fall of 180 inches of water, turning a four-foot Pelton wheel. The North Star mine on North Fork, 8 miles from the fork, has a ledge from one to four feet wide. It is worked by a 60-foot tunnel and a 75-foot incline shaft. It has a vertical depth of 60 feet. A wagon-road one mile long leads to the mine, and a ditch half a mile long furnishes the water-power necessary to run the mill of five stamps. Seventy-five tons of ore recently averaged \$10 to the ton. The facilities for working are quite crude, and much loss is sustained by want of concentrators. A hurdy wheel with an 80-foot fall of 60 inches of water keeps the mill running in good shape. The Trinity gravel mine was located in 1857 and incorporated in 1874. It is situated four miles west of Weaverville. The depth of gravel is 500 feet and the pay channel 500

to 1000 feet long. This claim has been worked for 14 years. With 2000 inches of water \$500 is produced every 24 hours. Last year the company worked 369 hours and took out \$8000. The McMurray & Hupp mine was located one mile southeast of Weaverville in 1853. This claim has 95 acres of a sedimentary formation, the pay being gravel not cemented. The depth of gravel is from 25 to 50 feet. They employ 15 men, and the gross product averages \$2500 per month, which can be increased with an increase of water. The Ward placer mine contains 420 acres, and the gravel bed is half a mile wide and from 200 to 400 feet in depth. It has taken 14 years to open this mine, which will not be worked out in a century. Lack of sufficient water curtails the work, but when there is plenty of this fluid the mine produces \$25 per hour. Mr. McGregor feels that there is a fine mining future for Trinity county, and, as before stated, the East Fork country claimed his special attention.

Tuolumne.

GRAVEL AND QUARTZ.—*Sonora Democrat*, Aug. 4: E. N. Cherenich acquired an interest in a lease on the Morris mine at Bald mountain and went to work Tuesday. Quartz-mills in the neighborhood of Soudsbyville have been compelled to shut down on account of the break in the big ditch. Johnny Hartvig's mine which is situated three miles south of Sonora is looking favorably again. Messrs. Edward and James Garrett and Edward Stone are sinking a new shaft higher up on the Garrett mine. The pocket taken out of the Sell mine recently amounted to about \$3000. Jackass Hill near Tuttletown is unloading its burdens of gold. No less than five or six different parties are now and have been taking out gold. Messrs. Rice and Gillis it is reported have taken out over \$10,000 in the last six months. We learn that W. Bingham and Jack Noonan are mining out at Campbell's Flat and they have very good and indeed flattering prospects. G. L. Meade has leased the "Mexican lead" at Brown's Flat. This mine a few years ago yielded several large pockets. The quartz-mills in the neighborhood of Jamestown had to shut down recently because of scarcity of water. Of course the operations in the mines will continue, but the stopping of the water is a material detriment. The triangular concentrator of J. B. Wilder at the Sonora foundry works well and satisfactorily. The Carlot's mine situated a short distance above Summersville is sending forth some good ore. Mr. Symons, the superintendent, has about 50 tons of ore out which will soon be crushed in the Soudsby mill. There appears to be a general revival of river mining all along the Stanislaus and Tuolumne rivers. Every day almost there comes evidence of renewed faith in the beds of the rivers. They have in times gone yielded millions of dollars, and their treasures are not even now exhausted. Some time last week a party of 12 men started to mine the river bar a short distance above Byrne's Ferry. From T. H. Skaggs who was in Sonora last Saturday we learned that he and his partner are doing well at their Table Mountain mine on Mormon Creek. After only five days of work he and his partner, F. McTarnahan, cleaned up 11 ounces of gold—a little over \$200. Considering that the work of drifting the gravel and working it was all done in that time, it must be admitted that the mine is rich.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Virginia Enterprise*, Aug. 2: Since last report have hoisted 2527 tons from the 600 and 700 levels, and have shipped to the Mexican mill 836 tons and to the Nevada mill 1770 tons. Average battery assays, \$30.82 per ton. The stopes throughout the mine continue to look well. Have bullion on hand and previously shipped for the month amounting to \$70,000.

GOULD AND CURRY.—*El Dorado level*: The south drift from west crosscut No. 2 has been extended 20 feet; total length, 104 feet, still showing milling ore. During the week there has been extracted from the 250 and 300 levels, and shipped to the Douglass mill, 270 tons and 1600 pounds of ore, the average battery assay being \$24.78. Shipped to San Francisco bullion of the assay value of \$3998.60; bullion on hand in assay office in Virginia, \$3104.29.

SAVAGE.—The south drift on the 400 level has been advanced 130 feet and connected with a south drift from the Gould & Curry mine on a corresponding level. This connection greatly improves the ventilation on this level. From between the 400 and 750 levels have extracted 764 tons of ore, which has been shipped to the Rock Point mill. Average battery assays, \$19.48 per ton.

SEGREGATED BELCHER.—The raise is now up 70 feet, or at a point about equal to the 1200-foot level. For 60 feet it has been in quartz yielding good assays, but has narrowed somewhat toward the top.

BELCHER.—The 500 crosscut advanced 22 feet during the week; total length, 130 feet. No change in the ground to report. The shaft has been repaired about 200 feet during the past week.

LADY WASHINGTON.—Good progress is being made in the northwest drift on the 725 level. We expect that it will cut the Keystone vein in going a farther distance of from 20 to 25 feet.

BALTIMORE.—The pumps are working well, and the usual prospecting work is being done on the 300 level. Some streaks and bunches of good ore are being encountered.

YELLOW JACKET.—Have stopped shipping ore to the Brunswick mill. The shaft of this mine is now in better condition than it ever was before since it was built.

CONFIDENCE.—We are shipping daily to the Brunswick mill for reduction 185 tons of ore, the average battery sample of which shows a value of \$25 per ton.

ANDES.—Have sunk a winze on the 240 level 51 feet and started a drift from the bottom to the west. It is in quartz with little bunches of ore here and there.

IOWA.—The work of opening the main shaft is now completed. The Pelton water-wheel has been repaired and everything is in good shape.

OCCIDENTAL.—Extracted 107 tons of ore. Shipped to the Atlanta mill 88 tons. The assay value of wagon samples is \$28.50.

CONSOLIDATED IMPERIAL.—Repairs to the main north lateral drift on the 1100 are still going on.

CHOLLAR.—On the 650 level the north raise is in ore of a fair milling grade. The face of the north

drift on the 450 level continues in low-grade quartz. Only 20 stamps are in operation at the Nevada mill, and these are running on Hale and Norcross ore.

WEST YELLOW JACKET.—Have started a raise to connect with the incline. Stringers of high-grade ore are encountered.

ALTA.—The stamps and concentrators are running steadily, and the usual amount of ore is being mined on the 825 level.

CHALLENGE CONSOLIDATED.—Repairs to the raise and general repairs throughout the mine are still going on.

EXCHEQUER.—The face of the northwest drift on the 122 level continues in quartz of favorable appearance.

CROWN POINT.—The 700 crosscut is still advancing in favorable looking ground.

Bristol District.

COPPER.—Pioche Record, Aug. 2: The second short run of the Roe Bros' furnace at Bristol ended last Monday, the result being ten tons of almost pure copper. The small furnace was at once torn down and a larger one is now in process of construction upon the same site. When completed it is hoped it may run steadily, and the success attending the two short runs already made indicates that it will. Samples of the copper produced at the first run were sent to New York and the response received was a request to forward there all their product.

Cherry Creek District.

A BONANZA IN THE STAR.—White Pine News, Aug. 4: Last week we paid a visit to Cherry creek and were pleased to note a great improvement in the mining outlook of the old camp. We visited the Star mine, which is one of the finest ore bodies we have seen in many a day. The new bonanza is on the 160-foot level on the south ledge and is seven feet wide by 40 feet in height. It is a well-defined, true fissure vein of fine quartz, carrying about one-third gold to two-thirds silver, and pitches to the east, where a large scope of unexplored ground still remains. Foreman Jack Bews thinks the ledge will run 300 feet further east. It is probable that Messrs. Keeney & Martin, who are operating the Star, will shortly increase their milling plant. The ore is free milling and the gold it contains brings the bullion up from \$1.25 to \$1.30 per ounce.

Devil's Gate District.

MINING LITIGATION SETTLED.—Virginia Enterprise, Aug. 3: Day before yesterday the owners of the Oest mine, in the Devil's Gate district, bought 400 feet of the south end of the South End Mining Co.'s claim, paying Messrs. Pollard & Lux therefor \$1600 and to George Walker \$2300. The latter parties were litigating for possession of the claim, and the Oest party bought both out. This clears every imaginary thing likely to come in conflict with the Oest location. Since Fred Oest struck pay rock in his mine, about three years ago, he has purchased and settled three different claims. By the last purchase the Oest party obtains possession of a tunnel through which they can advantageously work the north end of the Oest claim almost to the present depth of the mine without hoisting. The Hayward mine, which is on the same ledge, has by far the largest body of ore discovered in the district. It is being worked by Messrs. Hamilton, Quinn and others. The building of a ten-stamp mill by these gentlemen is contemplated. Messrs. Pollard & Lux, both old standbys of the district, have ore in their claim which they work at a profit. The above, with considerable prospecting work being done by individuals, insures the future prosperity of the Devil's Gate district, and bids fair to build the town larger than it ever was before.

Eureka District.

SILVER CONNOR COPPER ORE.—Eureka Sentinel, Aug. 4: The Silver Connor is practically a gold-iron mine, but some time ago a deposit of copper ore was discovered in it, and in order to ascertain its economic value, a sample of one ton of the ore was sent to Salt Lake. An assay of the pulp made at the Germania Smelting Works shows that it contains 34.2 per cent copper, 4.4 per cent silica, 25.2 per cent iron, 6.7 per cent zinc and 2.5 per cent sulphur. In addition it carries 2.9 ounces of silver and .050 ounces of gold to the ton. This ore, after deducting the expenses of freight and reduction, will net, in Salt Lake City, \$15.23 per ton.

Good Hope District.

NEW MINES.—Silver State, Aug. 2: Frank Burton and Mr. McMasiff have found a new mine in what is known as Good Hope district, near the old Winnemucca and Cornucopia road, which promises to be quite valuable. In running a tunnel to cut an old lead, which crops on the surface, they found a four-foot ledge, which carries two feet of ore that averages \$200 to the ton in gold and silver. They have taken out about 40 tons of ore, but have had none of it worked yet. The ore is rich in ruby silver.

Mammoth District.

ILLINOIS.—Belmont Courier, Aug. 4: Alfred Welsh continues to work the Illinois mine, Lodi, Nye county, with flattering results. He is making regular shipments of high-grade ore to the Selby Smelting Works, San Francisco, for treatment. James Graham and A. Farrington expect to cut the ledge in the Silver King soon. Lodi bids fair to become one of the most lively camps in Nye county.

San Antonio District.

NEW YEAR.—Belmont Courier, Aug. 4: Work is still progressing satisfactorily in the New Year mine, San Antonio district. The ores of this mine would leach better if they were roasted.

Seligman District.

CONCENTRATING.—Eureka Sentinel, Aug. 4: The Frue concentrator placed in the machine-shop at Seligman is in running order, and the mill which was closed down for a few days to adjust the necessary pulleys and belting was again started up last Tuesday. The Frue vanner is intended to work on the dust and slums from the dry concentrators.

Tucacora District.

DEL MONTE.—Times-Review, Aug. 3: An air shaft has been started and is down 28 feet.

NEVADA QUEEN.—The stopes over the 350-foot level are looking well and show a large amount of rich ore. The drift 100 feet above has been extended six feet and continues to open up good ore. The mill was started Monday morning and is running all right. Average assay from battery pulp \$23.22 in silver, \$24 in gold; total, \$247.22. Furnace working 93 per cent and assays from the bins show no

loss in gold. Two hundred and sixty tons of concentrating ore were extracted; average assay from car samples, \$26.39 per ton.

COMMONWEALTH.—Intermediate drift on west side of the shaft is being extended north to connect with intermediate from No. 8 upraise. This drift is showing very high-grade ore. South of the shaft on this level the east lateral has been extended 9 feet in the vein, and is showing some high-grade ore. No. 1 winze from main south drift has been sunk 21 feet, the bottom being all in the vein. The joint raise near Queen line has been extended up 16 feet, and still shows very rich ore in the top. Bullion shipped, \$20,000.

GRAND PRIZE.—The stopes above the 200-foot level are looking well and furnishing the usual amount of milling ore, nearly all of which is chloride. The 300-foot level stopes continue to yield a good grade of sulphure ore. Mill is running and working nicely.

FOUND TREASURE.—Stop: from No. 3 upraise has produced usual quantity of ore. The steam pump has been placed in position, and is now handling the water.

NORTH BELLE ISLE.—The usual quantity of ore has been extracted. The framework of the concentrating works has been erected and the building is being inclosed.

NORTH COMMONWEALTH.—North drift on the first level has been extended to feet with an increase in the flow of water.

NAVAJO.—The usual quantity and grade of ore has been extracted.

BELLE ISLE.—The stopes are yielding as usual.

Union District.

PHONOGRAPH.—Belmont Courier, Aug. 4: F. C. MacNeel and J. L. Grimes are working the Phonograph mine, near Lone, and taking out ore of a high grade, which is shipped to Soda Springs for treatment. Ores are worked there for \$15 a ton and paid for at the rate of 90 per cent of their assay value. Alfred Phillips and Neil Carmichael are chloriding in the Indianapolis mine, near Lone, and making regular shipments of high-grade ore for treatment.

ARIZONA.

MOHAVE COUNTY.—Cor. Miner, Aug. 4: The Cupel mine was supposed to have been worked out to the 200-foot level, and as the pumps did not handle the water to give the miners a chance to work, they were taken out over a year since. Last week a miner went into the old workings and began prospecting at a point where the ore gave out. The result was he drifted about six feet into the foot-wall and found a fine vein of high-grade ore. Lessee Mackenzie has put several miners at work. The C. O. D. mine has been paying as usual. The Minnesota and Connor, owned and worked by John Barry, are turning out some rich ore, and the teams have more than they can do to haul it as fast as taken out. These mines are down about 200 feet and below water level, and may be considered permanent mines. The Night Hawk is another mine that has of late come to the front. A new body of high-grade ore has been found further in the mountain. All the above-mentioned mines are paying dividends. There are 20 other mines that I saw or heard from that are doing well and making a profit over and above wages. The present prospects in mining circles are as good or better than they ever were in this county.

NOTES.—Prescott Courier, Aug. 2: J. W. McGowan, superintendent of the Senator, has a large force of men putting up a mill and other works. Jas. Shirley tells us that ex-Sheriff Henkle is digging rich ore out of his mine in Bradshaw district. It looks like business to see two mills going up out there and big dumps of rich ore. M. H. Ryan has opened the Keynote mine, Turkey Creek district, to a depth of 400 feet, and is making a shipment of ore that is worth 645 ounces silver to the ton. Owners of the rich Howard mine think they will soon run against their vein in the tunnel. Geo. Burton and others are putting in a whip at the Parker, and will soon commence raising ore. Jas. Shirley has returned from Bradshaw district, and tells of fine mines seen by him. Moody & Place, Oro Bella and other companies are getting fine ore. M. S. Taft, of Big Bug, says Van Name's mill is making plenty of bullion. C. C. Bean is in Copper Basin. The mines there are yielding very fine copper ore. Riggs & Lawler, owners of the Hillside mine, have 20 tons of ore en route to Prescott that will yield not less than \$4000.

CROWNED KING.—Journal-Miner, Aug. 2: O. F. Place, superintendent of the Crowned King Mining Company, in the Bradshaw mountains, was in town yesterday, and although not given to saying much about the properties under his control, said they were opening up finely. He has a number of openings in the mine, and all of them are in good ore. Work on the mill is progressing rapidly, and they hope to start up next month. No stoping has been done yet, all the work having been done with a view of finding what there is in the property, and Mr. Place estimates that he has enough of ground opened up now with sufficient ore in sight to keep the mill running for three years.

BRITISH COLUMBIA.

THE BEST OF THEM ALL.—The Truth, July 28: Miners who have just returned from the McMurdo district, 30 miles southeast of Donald, report it the richest and biggest thing in British Columbia. The ledges are well defined between walls of granite and slate, the ore going high in both gold and silver, and is free milling. The district is above the timber line, being about 6000 feet above the sea level, and is in the glacier belt. Snow falls to a considerable depth, and, in fact, a little falls every month in the year. Archie McMurdo made the first locations in the district. He has already sent men and tools in to commence development work, and will send in more men immediately on his return from Victoria. He compares two of the claims in appearance to the great Spanish mine at Calaveras, California. The main ledge on them is over 90 feet wide, and is crossed by seven or eight narrower ones. In fact, there were so many veins that one location was too narrow to take in the ground, and two had to be made. The ore carries gray copper, sulphurets of iron and free gold, the latter visible to the naked eye. From \$3 to \$5 a day to the man can be made by crushing the rock in a hand mortar. Mr. McMurdo cleaning up over \$100 in that way. Assays give \$50

to \$60 in gold and \$70 to \$90 in silver to the ton. Higher assays have been had, but the above is a fair average. A Calgary company has already secured a foothold in the district, and have commenced work on a claim owned by Dainard & Lowe of Golden. At present the district is reached by a trail from Hayes' landing, 25 miles up the Columbia from Golden. The distance from the landing is about 25 miles, it taking Mr. Hepburn 11 hours to make the trip out with a pack animal. Men who know the country believe the McMurdo claims are not more than six miles from the new placer diggings on Porcupine creek, and if so, it is not 30 miles from Donald. The trail from Donald to Porcupine creek will be completed next week, and immediate steps will be taken to continue it to the McMurdo district.

COLORADO.

MINING BY ELECTRICITY.—Georgetown Courier, Aug. 2: An Eastern company is furnishing mining machinery operated by electricity, consisting of a central dynamo, conducting wires, drills, etc. We were informed by a well-known Leadville mining engineer that electric plants were contemplated by some of the larger mines. That the cost of coal was so enormous that it seriously interfered with development work, as nearly all the mines were "pumping mines" and in many instances the coal bill for one month would exceed \$2000. With a large central-power plant and wires to conduct the power it would be possible to cheapen the cost of pumping. He also thought that electricity would be successfully applied to the diamond drills, and with this advance in mechanical appliances the cost of mining would be largely decreased, and explorations carried out to an extent hardly thought possible a few years ago.

DAKOTA.

SILVER BULLION.—Deadwood Pioneer, Aug. 1: The Silver Bullion, or Fargo & Huyett mine, located at the head of Strawberry gulch, unquestionably is to-day one of the best pieces of mining property in the hills. Messrs. Fargo & Huyett have been working the claim only some 8 or 9 months, but in that time have accomplished a large amount of development work. Every dollar so expended was taken from the mine, which not only yielded enough for the first stroke of the pick to pay its own way, but has also paid quite a handsome profit over and above all expenditures for development. The ore is principally galena, and assays frequently run up into the thousands, while the general average is over \$100 per ton. The mine is opened in five different places, and in the floor of each drift, leads of galena from 5 to 7 inches wide appear. The walls and floor are quartzite, and in the value of this generally barren rock is the mine remarkable. The quartzite assays frequently over \$100 per ton in silver, while samples taken from different places and carefully assayed demonstrate the general average is about \$30. As the quartzite is present in immense quantities, the resources of the mine are virtually inexhaustible. Local experts offer no satisfactory explanation of the fact that the quartzite is metalliferous, but are compelled to accept the fact. A shaft has been sunk in one of the drifts, and a tunnel to intersect it has been started from the hillside, which when finished will open the property at considerable depth. Owners have a theory that the small ore-veins intruding through the quartzite were forced up from a large body that will be found at greater depth. Acting on this, and as it pays to sink or to work the mine in any other way, developments are now progressing, and will continue to progress as rapidly as practicable.

MONTANA.

THE PEARL.—Montana Mining Review, Aug. 3: Work on the Pearl mine in Flint creek district progresses. The machinery for the new hoist has been placed in position. The contractors on the extension of the tunnel are making good progress. Sinking continues on the shaft, which has at this date attained a depth of about 45 feet below the tunnel level. The same encouraging outlook, as reported heretofore, is apparent in the character of the ore and extent of the vein. The rich wire silver galena ore body holds its own, and the vein is still wider than the shaft.

SAMPLING WORKS.—The Montana Sampling Works are now running to their full capacity—in fact beyond their capacity, for the company has lately been obliged to increase its facilities. The fact of a new sampling works starting up will increase business. The ores in the mountains of which Helena is the center, if all sampled at home, would keep three or four first-class sampling works busy the year round, more particularly so after the Helena and Great Falls smelters get into full blast.

IDAHO.

SALMON CITY.—Recorder, Aug. 3: John Long, from his mine near town, reports the arastrarunning nicely and the prospect very flattering for a good cleanup. There are 20 men employed at the Shoo Fly mine at the present time, which insures the mill to be in operation very soon. Eli Suydan has leased the Gold Block mine owned by McCormack & Co. This is the recent rich strike on Boulder Creek near the Sherman arastra. The one-stamp mill belonging to Messrs. Pollard & Kenney, at Pine creek, will be started up by Messrs. Josh Brown & Sam James as soon as the tramway is completed. They will run on ore from the Little Mike mine. Cleaning up continues on Bohannon Bar with results as satisfactory as predicted. Messrs. Potter & Barrack, the lessees, will continue next season and hope to get off much more ground. D. McNutt's splendid placer mines at Moose creek will make a large cleanup this season notwithstanding the lack of water. Jack Leopold, of Sandy creek, reports a large number of prospectors making locations in this new and promising district, and rich strikes are numerous. From the present outlook no more flattering prospects of a future camp can be found in Lemhi county.

THE KING OF THE WEST.—Wood River Times, Aug. 1: The new concentrating mill just built on the King of the West group of mines, in Smoky, was started up Tuesday. After a few trial runs and several unavoidable stoppages for the purpose of making slight alterations about the jigs, tailings sluice, etc., it was finally started yesterday noon, since which time it has run uninterruptedly. The

mill is of 60 tons daily capacity—that is to say, it can concentrate 60 tons of crude or undressed ore and thus make from 5 to 15 tons of shipping ore per day, according to the character of the rock put through. The mill, Colonel Wall informed a Times reporter, worked like a charm.

TAILINGS.—Challis Messenger, Aug. 1: The Dickens-Cutter mill is now being run on the old arastra tailings from the Charles Dickens mine. This only necessitates the use of the roasters and pans, and the stamps are hung up.

SEAFOAM DISTRICT.—The Josephus, owned by Chris Morler, A. M. Wilson and others, is being worked by six men, and is developed by a shaft and tunnel. The shaft is 30 feet deep and the tunnel 24 feet in length. A fair grade of ore, in abundance, is found in both workings. The White Goat, owned by Enos Watson, Emanuel Bell and others, is showing nicely for the amount of labor performed. Nothing but development work, thus far, has been done.

NEW MEXICO.

SILVER CITY.—Enterprise, Aug. 3: Ten men were put at work in the Deep Down Wednesday and about 40 more will soon be employed. John H. Bragaw is working ten men on the Satisfaction, leased from Phely, and is getting good returns. The Nimbres mill will start up next Monday on a big lot of good ore. About 300 tons of iron ore is shipped from here each month to smelters, the price realized being \$4 per ton on the cars. Peter Mungall, one of the most stirring of miners, has shipped a carload of zinc from Hanover gulch to St. Louis and will soon send another. Thomas B. Phely has 65 men at work at Georgetown. Most of them have been allowing the larger part of their earnings to go to pay debts incurred when they were leasing unprofitably. But nearly all are even now. The Smith & Ailman mill is running 100 tons of Golden Gilt ore. There has not been a cleanup, but the ore is believed to be yielding as well as has that of the Mountain Key.

OREGON.

PROSPECTING.—Jacksonville Times, Aug. 2: Considerable prospecting is going on in Jackson and Josephine counties. Carpenter & Co. have taken possession of P. H. Oviatt's placer mines in Josephine county. Rev. J. J. Kennedy has struck some excellent quartz in Steamboat district. Piping is still progressing at J. T. Layton's mines in Farris gulch, with excellent prospects. The Sterling Co. is still piping, having a good supply of water. They will commence cleaning up soon, however. J. W. Adams & Co., who have been engaged in placer mining in Eden precinct during the past season, are cleaning up with good prospects. Shearer & Finney of Steamboat are engaged in cleaning up. They found two good-sized nuggets recently, one of which weighed \$40 and the other \$60. Gro. Jensen and Jacob Klippel are now engaged in prospecting the Col. Irish ledge in Willow Springs precinct, from which such rich ore was recently obtained. G. C. Culy of Steamboat district was in Jacksonville yesterday for the purpose of obtaining hardware for an arastra. Abbott & Griffith, who purchased the old Fowler ledge of Richard Cook, are building. They have struck some very good quartz.

TO CRACKER CREEK.—Bedrock Democrat, Aug. 3: Main street yesterday morning presented a lively appearance, brought about by the departure of four different stages filled with passengers for the Cracker Creek mines. Not only are miners seeking the new El Dorado in the hope of striking a bonanza, but persons are going there to start different branches of trade, the forerunner to the building up of a large and prosperous town. Of those who went out yesterday, one is going to start a store, another a butcher shop, and another a hotel. It is plainly evident that the Cracker creek boom has struck far and near, and hundreds of people will arrive during the next few weeks.

UTAH.

REVIEW.—Salt Lake Tribune, Aug. 3: The current week sees the close of the seventh month of this year, with bullion receipts (excluding all ores) as follows: January, \$327,141.43; February, \$285,687.79; March, \$283,263.98; April, \$224,019.60; May, \$385,735.14; June, \$333,899.42; July, \$319,683.26; total, \$2,159,430.62. Of course there are some operations not making current reports that are left out of the above, and the ore shipped out of Utah to be worked should mostly be added, but the amount of this in dollars and cents is not now obtainable. Taken altogether, there is a notable decrease in production from last year. The local situation is not improved. The Hanauer smelter produced well, and the ore shipments outward were again heavy. The receipts in this city for the week ending August 1st, inclusive, were to the aggregate value of \$88,349.09, of which \$50,888 was bullion and \$37,461.09 was ore. For the previous week the receipts were \$71,856 in bullion and \$37,069.83 in ore, a total of \$111,925.83. The Ontario product for the week was \$10,435.95 from ore sales, and 29,938 fine ounces of silver bullion, an approximate total of \$40,343.95. The daily output for the week was on ore sales, \$5594.09. Fine bar receipts in this city for the week were to the value of \$3450; base bullion, \$20,938. The Hanauer smelter produced bullion during the week valued at \$77,500. Ore receipts in this city for the week were \$24,061.09 by Wells, Fargo & Co., and \$12,800 by McCormick & Co.

WASHINGTON.

CLEARUM MINES.—Washington Farmer, Aug. 4: T. J. V. Clark and Jeff McDaniell have returned from the mines on the Clearum fork of the Yakima. They, together with Al Churchill and Jimmie Grieve, own the Mammoth lode, which is 70 feet wide. The ore runs 22½ per cent copper, \$44 gold and 17 ounces silver from the croppings. The owners have located two extensions and now own 4500 feet. They are running a tunnel 70 feet long to tap the lode 100 feet below the surface, and expect to ship ore. The Ida Elmore, owned by S. S. Hawkins, Jimmie Grieve and W. F. Wilcox, is being developed by a tunnel 80 feet long to cut the ledge on the 100-foot level. James Lynch has sold the Aurora for \$25,000, of which \$1000 was paid down. The purchaser is an English company, of which the principal man is Mr. McCulloch.

— THE —
JOSHUA HENDY MACHINE WORKS,
 Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
 J. R. TREGLOAN, Sept. South Spring Hill Gold Mining Co., Amador City, Cal.
 W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
 And will furnish descriptive Catalogues and quote prices upon application.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

— THE —
DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot-Cut hurred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
21 & 23 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

THE PELTON WATER WHEEL

Obtain the highest efficiency of any Wheel in the world and is everywhere recognized as the standard for high pressure service.

UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the country. It is not only most economical of water, but the most ample and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Tram cars, etc. Address

The Pelton Water Wheel Co.,
127 FIRST ST., SAN FRANCISCO, CAL.

Practical Treatise on Hydraulic Mining.
By A. O. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurds, rockers, undercurrents, etc.; also describes methods of blasting, tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

San Francisco Cordage Factory.
Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tanned Manila Ropes, Hay Rope, Whales Line, etc., etc.

Extra sizes and lengths made to order on short notice
TUBBS & CO.
611 and 613 Front St., San Francisco.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE,
SUPERIOR TO IRON FOR

LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1 to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tire, Flaw Steel, Machinery and Special Shape Steel to size and length. STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes, Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
(ESTABLISHED IN 1855.)

TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settling, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jacketed, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

DEANE STEAM PUMP.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroad and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS

A specialty. Round, slot or hurred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

INVENTORS, TAKE NOTICE!

THE RAND DRILL COMPANY,

23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary

PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder. In respect to capacity IN SPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHENTICATIVE CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

The Principles of Blasting.

In the MINING AND SCIENTIFIC PRESS of last week we gave some sketches of mining-drill points taken from H. S. Drinker's complete work on "Tunneling, Explosive Compounds and Rock Drills," published by John Wiley & Sons of New York. This week we reproduce from the same source diagrams illustrating the principles of blasting, which will be of interest to miners:

Blasting may be defined to be the rending or tearing apart of any solid body by the pressure or shock exerted upon it from the sudden development of gas of high tension evolved on the ignition of some explosive compound placed contiguous to it. As the drilling of the holes may be said to be the dearest part of blasting, it follows that great care should be taken in setting each hole in such a position and in drilling it of such width and depth as to insure the greatest effect at the least cost. When we recall the many circumstances that may influence the effect of a shot, it is evident that the proper setting of the hole is a matter rather of judgment, based on experience, than one to be decided by empirical rules, for even were a set of rules deduced from experiments in one material, they would only apply, under similar circumstances, in the same material. The effect of a shot may be influenced, among other considerations, by: (a) The shape in which the rock is presented, the size and number of the open faces, the shape of the piece it is desired to take out, if that is an object, and, of course, primarily, the size of the cross-section of the face if it is heading work. (b) The texture of the rock, whether it is hard or easy, firm or loose, whether it is brittle or tough; thus experience gained in blasting close-grained, hard granite, trap, gneiss, etc., would not apply to limestone, sandstone, slate, etc. (c) The structure of the rock, whether it is laminated, stratified or fissured; upon its cleavage, etc., and upon whether it is massive or broken, etc. (d) The elasticity of the rock. (e) The explosive used. (f) Whether the hole is to act alone or simultaneously with or following others; in the case of simultaneous firing, the question arises of how the waves of oscillation will best act in concert. (g) The character of the fuse and tamping.

And now, supposing a shot is to be placed in any position whatever, its action will be in the line of least resistance with the lower explosives, and its greatest effect will also be in the direction of that line with the higher ones.

Let us consider the lines of least resistance in the black powder. We must assume that, on ignition, the gases developed act primarily radially; that therefore the tension of the gas extends from the point of ignition (which must be assumed to be in the center of the charge) in all directions, and that, according to the location of the charge and of the number and relation of the open faces, an undulation in the rock is produced, which, when the limit of elasticity is passed, will cause the splitting and tearing apart of the rock; and as the force developed will naturally find its vent by the shortest road, the distance between the charge and the nearest external point is called the line of least resistance.

In a perfectly homogeneous material, a regular funnel or crater would be formed, but this is, of course, only approximately attained. In actual practice, an irregular separation of the

rock is effected. We accordingly have the following general rules:

1. The hole should not be located in the line of the least resistance, otherwise the tamping would simply be blown out. Be it remem-

bered this discussion is as to black powder, not nitro-glycerine.

2. Experience has established the average to be as four to three, or the length of the line of

the sphere of rupture determined by $b c$ will seldom be larger than the depth $a b$ of the hole, and it would probably be equal to $a b$ only in very easy material, when $a b$ is set at an

HUNTINGTON'S IMPROVED ROCK BREAKER.

While in Fig. 1, on account of the assumed firmness, structure, coherency, etc., of the rock, the line of least resistance formed an angle less than 45° with the face, there may be other cases (Fig. 3) where the hole should be set at a greater angle, say even 60° . In this instance, if the face $i m$ be all firm rock, it is not probable that the volume $i k m$ would be detached, but in general, the wedge $i k y n$ would be ejected. But say $o p$ represents a fissure or holing, or perhaps an open face produced by a former shot, we may then, irrespective of the line of least resistance $k l$, assume that, under favorable circumstances, the section $i k o p$ would be thrown, provided $k o$ be not larger than the depth $i k$ of the hole. From these considerations, we may deduce that,

3. Holes ought, in general, to be bored at or under an angle of 45° ; a larger angle, increasing to as much as 90° , is advisable when open faces (as $r s$ in Fig. 3) occur, and a smaller angle (Fig. 1) is advisable when the texture and structure of the rock necessitate assuming the line of the least resistance as less than three-quarters of the depth of the hole. Further, as the mass thrown breaks in the general direction of the line of least resistance, and as, in fact, this line lies in the mass ejected, or, in the extreme case of an angle of 90° , bounds the ejected mass, we must carefully observe the external shape of the rock in order to reach a maximum effect.

The Huntington Rock-Breaker.

Frank A. Huntington of this city, manufacturer of mining machinery, is now making an improved form of jaw-crusher, a cut of which is given on this page. The main features are strength, ease of adjustment and simplicity of construction.

The movable jaw A is worked by the eccentric B and is pivoted at the bottom. The stationary jaw D is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt C . The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt C and the jaw D . The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

It is reported that advices have been received of a strike among the Australian colliers. This has been anticipated for some time. The demand on the coal mines of Australia this year to date has been unprecedentedly heavy, and the miners have been worked for all that could be got out of them. The strike will be embarrassing in several directions, especially if it should be prolonged. Australia is an important source of coal supply for California, and if this strike continues, doubtless there will be a further advance here. The receipts here for the past week were 46,555 tons, of which over 25,000 tons was coast.

SOME miners on 40 Mile creek, Yukon river, Alaska, have been making from \$8 to \$50 per day in coarse gold. The largest nugget found was \$40. The season is very short and the country a hard one to live in. Eight miners recently returned here from that region. Several of their party died there and all had the scurvy.

DIAGRAMS ILLUSTRATING PRINCIPLES OF BLASTING.

the least resistance will be three-quarters of the depth of the hole; and experience has further shown that the charge of black powder should be, on the average, about one-third of the depth of the hole, the varying limits being 0.29 to 0.45.

If in a massive rock not fissured, presenting

angle of less than 45° with the face $a c$. If we bore the hole $e f$ (Fig. 2) on an angle of 45° , we will have for the length $f h$ of the line of least resistance the expression.

$f h = e f \cos 45^\circ = e f 0.707$,
By which the greatest possible value ($\frac{2}{3}$) is reached.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Mines Around Murphys, Calaveras Co.

EDITORS PRESS:—The writer has, in previous letters, endeavored to call the attention of mining men to the advantages this section offers for profitable investments in quartz mining. Since first writing a number of mines have passed into the hands of capitalists and are now being developed and equipped for profitable working. These, however, represent but a small portion of the numerous gold mines in this vicinity. In order to give the reader an idea of the characteristics of the mines of this section, I will endeavor to give a short description of a few of the mines which at this time invite and will reward inspection.

Dussell Mines.

These mines are located immediately at the head of Nigger gulch, about a half-mile west of Murphys. Nigger gulch had proved rich, in early mining days, up to its head; that it paid well was all the miners asked, and they troubled themselves little, if at all, as to the source of supply. In October last a prospector "picking" over the gulch found coarse quartz gold running up to ounce pieces. Digging into the bank at the head of the gulch, he uncovered a mass of quartz showing a large amount of gold. A crosscut was then driven on the lead, which showed a width of 18 feet. From the quartz extracted in driving the crosscut the boys pounded out \$225. Believing the rock would pay to mill, 20 tons were crushed in the Oro Plata mill, which gave \$11.30 a ton. Adding to this the \$225 pounded out of this rock before milling, and the returns were \$21 a ton.

Stimulated by this handsome showing on an 18-foot vein, the owners contracted for a mill and started a shaft on the hanging-wall. The mill is now in operation and the last quartz taken from the bottom of the shaft was so rich that it might be called specimen rock. The vein is in slate and is of a loose shelly crystalline and granular quartz intermixed with mineralized slate. Two men extract and place upon the dump four tons in eight hours. The gold is very free-milling. By reason of the size of the vein, no timbering other than stalls is required, while the rock crushes like sand. The Union Water Company's ditch crosses the claim, while Nigger gulch affords a fall of 300 feet for water-power. If this mine was located in Alaska or Africa, it would soon become famous. As it is, the property is in a section that offers every opportunity for profitable working. With a 60-stamp mill crushing 180 tons a day, this property would soon give this section an enviable reputation.

Gladstone, Summit Blue and Sunnyside Mines.

This group comprises three locations on four parallel veins, distant about 50 feet from each other. From the Sunnyside, rock milled \$20. Summit Blue quartz was sold to the Oro Plata Co. for \$12.50 a ton, and was said to have gone \$20 to the ton. From the Gladstone a like return has been realized, while the Big Ribbon vein has not been milled but shows by assay that it will do as well. Veins are all in slate. Quartz is a fine ribbon throughout the length of the veins on the locations (3000 feet). The Sunnyside vein is 8 inches; Summit Blue, 8 to 18 inches; Gladstone, 18 to 24 inches; Big Ribbon, 1 to 4 feet. These mines are located within a half mile of Murphys, and cross the mountain diagonally, thus affording an opportunity to cut the leads by a crosscut at any desired point at a depth from 50 to 600 feet; or a drift can be run directly on the veins and the same depth attained.

The Union Water Company's ditch crosses the mines 300 to 600 feet above the base of the mountain, giving all the fall desired for water-power.

Emeralda Mines.

These mines are located on Indian creek, about three miles northwest of Murphys. A 10-stamp mill and steam-hoist, with all the necessary buildings, are erected on the mine. The group takes in 4900 feet on the vein with an additional five-acre mill-site. The shaft is now down 250 feet, with levels 100 to 300 feet long driven at each 50 feet. The vein averages two feet, though for 300 feet it is 30. The quartz is ribbon in structure, easily milled; gold free, splendid gouge to good slate walls; rock mills \$6 to \$20 per ton. There is free water for the battery, while water for power can be piped on to the mines. This property needs only to be seen to be appreciated. Not to tire the reader, I will not go into further particulars, but merely add that these mines are for sale at reasonable prices and with a climate that admits of working every day in the year.

Miners' wages here are \$2.50 a day; timber, 12½ cents a foot; logging, \$50 per M.; water for power, 10 cents an inch, and 300-foot fall can be obtained on all of these mines, thus requiring but a small amount of water in consequence of the great pressure. The railroad is 35 miles distant; freight one half cent a pound. There is a foundry and machine-shop within five miles; the roads are good. These mines are all in a settled section with good society, schools, churches, stores and hotels. To the man of capital who means business I will be

pleased to give any further information in regard to those or any other mines in this section, believing from an experience gained by a personal examination of hundreds of mines in Dakota, Colorado, New Mexico, as well as in other portions of California, that for the amount asked and natural advantages offered, no section can excel that of Murphys, Calaveras county.

Murphys, Cal.

E. H. SCHAEFFLE.

Leadville.

The Geology and Ore Deposits.

[Written for the PRESS by W. H. STORMS.]

The Leadville mining region is situated on the east side of the valley of the Arkansas river, at the head-waters of the river of the same name.

The large amphitheater-shaped basin in which the mines occur shows clearly the glacial origin of that portion of the valley. But the evidence is doubly conclusive in the glacial lakebeds and drift which underlie the city of Leadville and a considerable area outside of the city limits.

The Leadville district is the largest silver-producer from lead ores in the world, having turned out since 1878 a total in bullion and ores nearly aggregating \$150,000,000.

The geology of the district is not by any means complex, though faults are both numerous and extensive.

The base of the sedimentary series is represented by a heavy bed of a dense, firm quartzite which is referred to the Cambrian, and this is generally conceded as being correct. In places it attains a thickness of over 100 feet, but up to this writing has been found poor in ores, though some gold and a little silver has been mined from it. The quartzite rests uncomfortably on the upturned schists of Archean time, though the latter is in places displaced by porphyritic eruptives.

Overlying and conformable to the quartzite is a stratum of white magnesian limestone, and upon this rests a second stratum of quartzite (locally known as the parting quartzite). These latter are probably of Silurian age, but some refer them to the Cambrian.

Next in the ascending order is a thick, heavy bedded deposit of blue limestone (Silurian), which is as far as developments have progressed the principal ore-bearing stratum of the region.

The blue limestone is usually covered by a heavy sheet of feldspar porphyry of a white or light-gray color, which in places is interstratified with sheets of gray porphyry, which bear the appearance of having been injected into the mass from the neighboring eruptive dykes.

Over the greater portion of the area, immediately in and about Leadville, the feldspar porphyry completes the series of rock formation. The remaining localities are covered with a deposit of Weber grits, a coarse-grained sand-rock, which in places is deserving the name of conglomerate. The thickness of this deposit is variable.

Over the entire region is spread a deep quaternary deposit of glacial lake-beds and post-glacial drift. So general is this formation that an outcrop of rock is rarely found at the surface.

This fact alone has rendered prospecting in Leadville difficult, expensive and uncertain; but fortunately, owing to the unusual extent of the ore deposits, but few shafts have been sunk to contact that have failed to find ore in greater or less quantity.

The great ore bodies which made Leadville famous during the early period of her history, lie mostly in the upper portion of the blue limestone, and usually in contact with the overlying feldspar; there are, however, exceptions.

Mining experts have advanced numerous theories to account for the ore deposits, and there is still a disagreement as to the class of veins under which these ore bodies should fall. Many have called them contact veins (there certainly is a contact). Others call them contact fissures—a distinction without a difference. The finding of slickensides in some of the mines, notably the Colonel Sellers, probably led to the adoption of the latter name. It should be borne in mind that the crust of the earth is being subjected constantly to forces which produce motion, and slickensides is the result—not only in mines, but elsewhere, far removed from mineral veins.

The origin of the Leadville ore deposits is still a mooted question, though many theories have been advanced to satisfactorily account for them. While these several theories differ somewhat, all geologists agree that there is an intimate relation between the ore bodies and the eruptive rock of the region.

The opinion of S. F. Emmons is given as being one worthy of much consideration. That gentleman thinks the ore deposits were derived directly from the overlying feldspar. That the mineral solutions circulating along the bedding planes of the upper portion of the blue limestone, precipitated or deposited their mineral contents, slowly, atom by atom, replacing the limestone, which, being dissolved by the carbonic acid in the water, was carried away by the circulating waters. Mr. Emmons is also of the opinion that when the mineral solutions came in contact with a dyke of porphyry, the dyke acted as a dam, and for a time checked the flow of the mineral waters, and that portion of the ore body was in consequence much enriched. Finally, however, the waters passing through the dyke were arrested, as in an

eddy, on the other side, and it, too, became the rearing-place of large quantities of silver-bearing ores.

Charles M. Rolker, who had the advantage of a more thorough and extensive development of the mines of the district, is also of the opinion that the ore bodies derived their contents from mineral solutions circulating along the bedding planes of the lime rock, and also of the contact with the porphyry, and that the mineral solutions came from the eruptive rock of the vicinity, but not from the white porphyry. His opinion is that they came from the gray porphyry dykes, and, to give greater force to his argument, points to the fact that over considerable areas a dolomitic sand intervenes between the ore body and the feldspar. He furthermore offers as evidence that these mineral solutions came from the gray dyke porphyry, that the ore chutes follow the dykes and are richer near to them than at a distance. This is more particularly the case on Fryer hill, where are located some of the most famous mines of the district, among them being the Robert E. Lee, Little Pittsburg, Matchless, Chrysolite, Little Chief, Annie and others equally noted.

Mr. Rolker's theory is entitled to more than passing consideration, as there are other bodies of lead-silver ore where no overlying sheet of porphyry exists, and where the ore bodies have an undoubted relation to porphyry dykes in the vicinity. This is notably the case at Galena, in the Black Hills of Dakota, where the ore bodies occur in a heavy stratum of Cambrian quartzite; also at the Carbonate camp, West Virginia City, Dakota, where the ore bodies occur in Silurian limestone accompanying porphyry dykes. There are other instances similar to those at Leadville, but the existence of these counterparts and differences does not prove that no portion of the ore bodies of Leadville was derived from the overlying sheets of white porphyry.

The normal condition of the ores of Leadville was beyond question sulphide, as proven by the frequent occurrence of sulphide ores in partially decomposed masses of ore, and more particularly from the fact that the ore being taken from below the water-line of the district is, without exception, sulphide. The minerals are the sulphides of lead, iron, copper, zinc and sulphide of silver, with some native silver and a little gold.

The ores of the large and rich bodies near the surface or in the higher levels of the mines are simply the secondary products of the sulphides carbonate and sulphate of lead, with minimum and some rarer lead ores; oxides of iron, carbonates and oxides of copper, with some oxide of zinc, together with chloride of silver (in some instances in large and handsome masses), and native silver and gold, all of which have been produced by a decomposition of the sulphide minerals.

The large masses of chert found in some of the mines are doubtless due to the more siliceous condition of the limestone prior to the deposition of the ore.

During the earlier period of the history of Leadville it was thought that the ore bodies were confined exclusively to the upper portion of the blue limestone, but the development of later years has exploded this theory, as many large and rich deposits have been found in the lower portion of the limestone, which, in places, has a thickness of 300 feet. The first development in sulphide ore bodies took place in the Colonel Sellers mine, in California gulch, and subsequently similar deposits have been discovered on Carbonate hill and elsewhere. A like development of ore bodies obtains at the Carbonate camp, Dakota, in the Iron Hill and Wilkinson mines. These ore bodies occur in segregated bunches and sheets, sometimes apparently following the bedding planes of the limestone and at other times being entirely independent of it. They frequently have no apparent connection with each other, but a very close examination usually discovers a narrow seam of ochre or mineral (sometimes a mere seam of clay) which actually forms a connection between two or more bodies.

Leadville is by no means an anomaly, having many duplicates in all essential characteristics except extent and richness. In addition to the mines of Dakota above mentioned, may be added the mines at Aspen, Colorado, those of Eureka Hill, Nevada, Little Cottonwood and the Bingham and Dry Canyon mines of Utah; the mines of Sierra Majada, Mexico; and some in the North Park, Colorado, Wyoming Territory and in Idaho. Instances are numerous enough. The mines of all the sections mentioned bear a remarkable similarity to those of Leadville.

These facts are a basis from which some valuable hints may be drawn, viz.: The intimate association of limestone and porphyry or any sedimentary rock, and an eruptive rock is likely to result in a mine. Hundreds of places may be pointed out where the contact exists but where no ore body has been found, but there are no lead-silver mines in existence, to my knowledge, where these conditions do not obtain.

It is a matter of fact that nearly all large productive mines have some very evident relation to volcanic rocks in the vicinity, at least volcanic rock is there—in the neighborhood of the vein. As prominent among these are all the mines of the districts referred to above; the Ontario, of Utah, the Granite Mountain, the great veins of Butte, Montana, the Homestake, of Dakota, the world-renowned Comstock, the Silver King, of Arizona, the mines of Kingman, Arizona, the Hornsilver mine, of Utah, the Rosario, of Honduras, many of the bonanzas of Mexico and in numerous other localities. There

are good mines, it is true, where no igneous rock can be found, but these are mostly gold veins, producing a nominal amount of the precious metal.

There are several different porphyries at Leadville, the most important of which are the white or feldspar porphyry and the gray or dyke porphyry, which deserve more particular mention because of their intimate association with the ore bodies.

The feldspar at one time extended over the entire region in an immense sheet, which in some places attained a thickness of several hundred feet, though much of it has since been eroded by the scouring of glaciers, until, in a few instances, it has been removed entirely.

This porphyry is a portion of the immense eruptive mass which found vent at the head of Big Evans gulch, some 10 miles from Leadville. It doubtless occurred in the form of a great laccolite, and the sheet which covers the area of the Leadville region is probably only one of a number of such sheets which were injected between the layers of sedimentary strata.

The gray porphyry, however, seems to have been the result of local forces and is confined to a limited area (the mineral region) and has a more intimate relation to the ore bodies than the feldspar.

There is reason to believe that the ore bodies of Leadville were formed at a depth of 10,000 feet. The fact that this amount of sedimentary strata has been removed by the various processes of erosion would suggest this. The ore bodies, where found cropping at the surface, expose a considerable face, showing that they undoubtedly extended outward beyond their present limits. All the faults of the region have occurred since the deposition of the ore. There is ample proof of this in the fact that where ore bodies have been faulted their continuations have always been found to be counterparts, as regards size; moreover, fragments of the ore bodies have, in many instances, been dragged into the fault planes, and this alone is considered conclusive.

I write this lengthy letter at this time for the reason that the reports of the gentlemen who have made a thorough investigation of the region are published in volumes and papers which do not reach the prospector, and but few (comparatively speaking) mining men have ever had an opportunity of seeing them. I have endeavored to avoid technical terms, that all may understand the peculiar conditions under which lead-silver ores usually occur in sedimentary rocks, and it may be the means of directing attention to some valuable mines as yet undiscovered, and whose existence is entirely unsuspected.

Precious Metal Production.

The Director of the Mint has submitted to Congress a report on the production of the precious metals in the United States during the year 1887. The product of gold amounted to 1,596,500 fine ounces, of the value of \$33,000,000. The product of silver amounted to 41,269,240 fine ounces, of commercial value about \$40,450,000, and of the coin value of \$53,357,000. The gold product fell off from that of the preceding year, when it was \$35,000,000. The product of silver increased over that of the preceding year, when at coining value it was \$51,000,000. The product was contributed by States and Territories as follows, in coining values:

	Gold.	Silver	Total
Alaska.....	\$ 675,000	\$ 300	\$ 675,300
Arizona.....	830,000	3,800,000	4,630,000
California.....	13,400,000	1,500,000	14,900,000
Colorado.....	4,000,000	15,000,000	19,000,000
Dakota.....	2,400,000	40,000	2,440,000
Georgia.....	15,000	500	15,500
Idaho.....	1,900,000	4,000,000	5,900,000
Montana.....	5,230,000	15,500,000	20,730,000
Nevada.....	2,500,000	4,500,000	7,000,000
New Mexico.....	600,000	2,300,000	2,900,000
N. Carolina.....	225,000	5,000	230,000
Oregon.....	900,000	10,000	910,000
S. Carolina.....	50,000	500	50,500
Utah.....	220,000	7,000,000	7,220,000
Washington.....	150,000	100,000	250,000
Texas.....	250,000	250,000	500,000
Miscellaneous.....	3,000	2,500	5,500
Totals.....	\$33,003,000	\$53,408,500	\$86,411,500

The value of the gold deposited at the mints was \$84,667,712, of which \$32,444,067 was of domestic production, and \$39,092,051 consisted of foreign gold bullion and coin. The deposits and purchases of silver at mints amounted, at coining rate, to \$4,947,792. The imports of gold into the United States amounted to \$44,889,299. The imports of silver bullion and coin were \$16,772,614, nearly all of which was from Mexico. Silver ore were also imported, principally from Mexico, of the value of \$4,242,135. The director estimates the total metallic stock in the United States on the 1st of June, 1888, to have been: gold coin, \$592,129,702; gold bullion in the mints, \$114,710,817; total, gold, \$716,840,519; silver dollars, \$297,099,790; subsidiary coin, \$76,400,842; silver bullion in the mints, \$10,154,905; total, silver, \$333,655,537; total, gold and silver, \$1,050,496,056. An inquiry as to the value of the gold and silver used in the industrial arts in the United States during the year 1887, shows a consumption of gold of \$11,672,606, and of silver, \$5,241,998. The price of silver varied considerably during the year, the average being 98 cents per fine ounce. The amount of silver purchased for the silver dollar coinage was 24,797,279 ounces, costing \$24,221,257, the average cost to the Government being \$0.9768 per fine ounce.

The Russell Process.

Its Practical Application and Economic Results.

(Continued from our last.)

B.—Description and Cost.

1. Sodium Hyposulphite is packed in barrels of two sizes, one containing about 112 pounds and the other 550 to 600 pounds. It does not decompose in contact with the atmosphere. If imported in large lots from Europe, it costs in New York 1.5 cents per pound. If bought from dealers, the price asked is 2½ cents per pound in New York, 2.5 per pound in St. Louis and three cents in San Francisco.

2. Caustic Soda.—Only a high grade should be ordered, of 70 to 77 per cent, on account of freight charges. It is imported principally from England put up in sheet-iron drums, holding about 430 to 700 pounds, usually 640. It should not be left exposed to the air more than a day or two after being broken up, especially in hot weather, as it gradually decomposes on the surface, owing to absorption of carbonic acid. The price in New York is 2.425 cents per pound for 80 per cent. Hence a 74 per cent caustic soda would cost three cents per pound.

3. Sodium Carbonate.—Although any carbonate of soda can be used, the bicarbonate is less suitable than soda ash, on account of cost and for other reasons. It is most economical to buy the form of soda ash known as "pure alkali" of 88 per cent made by the Solvay or ammonia process. It is made in this country at Syracuse, New York, and costs 1.4 cents per pound at the works. This alkali, in the form of a white powder, is so pure that it contains 98.7 per cent of sodium carbonate, the remainder being principally sodium chloride and sulphate, and 0.25 per cent moisture. On account of the entire absence of the sodium sulphide and caustic soda (which are always formed in the ordinary soda ash), the solution for the precipitation of lead does not require purification. Both caustic soda and soda ash may be purchased of Wing & Evans, New York City.

4. Copper Sulphate or Blue Stone.—Price per pound 4½ cents in New York.

5. Sulphur.—It is immaterial whether the sulphur is crude or refined, lump or flower of sulphur. The lump sulphur requires to be broken up only so that it will pass a one-inch mesh screen. The native sulphur, occurring in large quantities in Utah, Nevada and other places, is suitable. The price in New York of refined sulphur in rolls is 2½ cents per pound; flower, 22 cents; Virginia rock, 2½ cents.

6. Sulphuric acid of 66° B. is best transported in iron tanks which hold about 1700 pounds. If shipped in this way the freight is much less than in glass carboys. The cost of a sheet-iron tank is \$6.50. Price in New York per pound, 1.25 cents; in St. Louis and San Francisco, 1.75 cents. Shipped in carloads the freight, for instance, from San Francisco to New Mexico, is only 1.67 cents per pound.

c. Comparison Between Sodium Sulphide and Calcium Sulphide.—If the lead is precipitated by itself by means of soda ash, sodium sulphide, and not calcium sulphide, should be used as a precipitant for the silver. But in any case sodium sulphide is far better as a precipitant than the calcium salt, for the following reasons:

First, the precipitating power of a pound of sulphur combined with sodium is nearly three times as great as when combined with calcium. For in the preparation of sodium sulphide the mono-sulphide (Na_2S) is formed, but in making calcium sulphide sufficient sulphur must be used to form the pentasulphide CaS_5 , as the lower sulphides are practically insoluble in water, and therefore cannot be used.

Secondly, the solubility of calcium hydrate as stated in works on chemistry is such that at 100° C., 1300 parts of water dissolves only one part of the hydrate, while the same amount of water at the same temperature dissolves 2600 parts of caustic soda. The solubility of caustic soda being thus over 3000 times as great as that of lime, it is not strange that the time required in making calcium sulphide is many times that required for sodium sulphide.

Thirdly, the amount of heat required in the preparation of sodium sulphide is only 2 per cent or 3 per cent of that for calcium sulphide. This is due not only to the fact that the union between sodium and sulphur takes place almost instantly, but also because there is a great rise in temperature due to this chemical action which causes the temperature of the mass to rise far above the boiling point of water.

Fourthly, the sodium sulphide is over 20 times as strong as the strongest calcium sulphide solution which can be made—that is, a given volume of the former will precipitate 20 times as much as the same volume of the latter. Hence there is a less dilution of the stock solution during precipitation.

Fifthly, as shown not only by the formula, but in practice, the product obtained while using calcium sulphide is contaminated with over three times as much free sulphur as that obtained while using sodium sulphide. The amount of sulphur in the sulphides at Cusi and Sombrerete (using sodium sulphide) is so small that the difference in weight and value between dried and roasted sulphides is only 6 per cent, thus allowing the substitution of a mere steam drying for the roasting, during which latter operation some silver is always lost by dust and volatilization.

Sixthly, if calcium sulphide is used, the product is contaminated with calcium sulphate also

(the sulphuric acid being derived from sodium sulphate always present in the lixiviation solution), which decreases the value of both dried and roasted sulphides and increases the weight and expense for shipment and refining.

Seventhly, the extent and cost of plant required for making calcium sulphide is much greater. For instance, at Cusi, while making calcium sulphide, four iron tanks were in constant use, three of which were always boiling. For the preparation of sodium sulphide only one of these tanks was used, and for three hours only (using steam one hour), once in 2½ to three days. The above comparison illustrates also the difference in time, labor and heat required.

Eighthly, the continual use of calcium sulphide gradually converts a sodium hyposulphite solution into one of calcium hyposulphite, which has been claimed as a better solvent for gold than the former, although no one has made the statement from his own experience, or has produced any experiments or statistics. On the other hand it has been repeatedly demonstrated on the small scale, and at Cusi on the large scale, that the solvent energy of the two solutions for gold is just the same.

Ninthly, the calcium hyposulphite solution

per cent stock solution, the grade of the product was increased over 100 per cent by the use of soda ash, and the weight decreased 32 per cent, thus effecting a great decrease in express charges. As the silver in sulphides is generally paid for at the rate of 97 to 99 per cent less \$100, more or less, for treatment, and as this \$100 is 1 per cent of \$10,000, but 2 per cent of \$5000 sulphides, there is a saving of 1 per cent if the sulphides assay the former instead of the latter.

Secondly, the obtaining of the lead product pure from other metals, and in a more compact and marketable shape than as sulphide. The separation of lead by means of soda ash is so complete that not the slightest trace is left in the solution after precipitating, and the solubility of carbonate of silver, gold and copper is such that no trace of these metals is found in the lead precipitate, except silver to the extent of one two-hundredth part of 1 per cent. At the same time no other metals can be precipitated with the lead carbonate, as all the compounds of zinc, manganese, nickel, cobalt, iron, etc., which are in the least soluble in a hypsulphite solution, are perfectly soluble in the first wash-water and are removed by it. The precipitate of lead carbonate is heavy and com-

in detail further on. In general, the order for wash-waters and solutions is as follows:

a. For Raw Ore.—No first wash-water. A strong extra solution is used first, either with or without circulation, followed by the ordinary, and finally by wash-water. In rare instances, the ordinary solution is used first, followed by a strong extra, circulated, then by ordinary, and lastly by wash-water.

b. For Roasted Ore with Acid First Wash-Water.—First wash-water; ordinary solution; strong extra solution, circulated; ordinary solution; second wash-water. No exception to this rule has so far been encountered.

c. For Roasted Ore with Alkaline First Wash-Water (Simple Alkaline Ore).—First wash-water; much weak extra solution, not circulated; ordinary solution; second wash-water. This has been the invariable order so far.

d. For Alkaline Roasted Ore with Arsenical Compounds (Alkaline Arsenical Ore).—First wash-water; ordinary solution; strong extra solution, allowed to stand; ordinary solution; second wash-water.

(To be Continued.)

The Foureroyas.

We are indebted to the *California Florist*, a new monthly journal established at Santa Barbara, for the opportunity to present to our readers an engraving of a very interesting plant which has bloomed this year on the grounds of Joseph Sexton, of Goleta.

The *Foureroya* is a noble genus of plants, named in honor of M. Foureroy, a celebrated French chemist; *Nat. Or. Amaryllidaceae*. In many ways they resemble the genus *Agave*, *Aloe* and *Yucca*. Paxton describes nine varieties, most of them from South America and Mexico, but omits *F. Bedinghausi*, one of the finest.

Some confusion has existed as to the identity of *F. Longava* and *F. Bedinghausi*, owing to the mesager descriptions given in the botanical dictionaries. Both varieties have now flowered in California and proved to be entirely distinct in every way.

Two years ago *F. Longava* flowered on the grounds of Dr. Lorenzo G. Yates of Santa Barbara. The plant was brought from Central America seven or eight years previous. In foliage the plant resembles a broad, long-leaved *Yucca*. The semi-flexible leaves are of a rich green color, and form a thick-set oval cluster close to the ground. The flower stalk, which grew as rapidly as that of the *Agave*, attained the remarkable height of 40 feet. Beginning about 10 feet from the ground, long, slender, lateral branches were thrown out at short intervals, gradually decreasing in length until the summit was reached. The numerous small grayish-white flowers were soon replaced by little bulletts, which also were produced from the axis of the branchlets. Hundreds of these bulletts are now growing into fine plants in various parts of the State. Some have been laid away for two years without nourishment, and are as sound, healthy and green as of yore. The parent plant has not died, but has become more hunchy and may possibly bloom again.

F. Bedinghausi, which is now in bloom on the grounds of Joseph Sexton, though not so ornamental or long-lived as *F. Longava*, is a wonderful plant, worthy of general cultivation. It grows to a thick stalk about 14 feet high. The bluish-green, flexible leaves, which are from three to four feet long, droop gracefully as soon as they reach maturity. Several plants have previously attempted to flower, but through their inclination to follow the sun around only succeeded in twisting their heads.

The plant and flower-stalk illustrated is about 42 feet in height from the ground, and the branches, as will be seen, are drooping under the weight of myriads of yellowish-green flowers. The plant is about ten years old.

Unlike *F. Longava*, *F. Bedinghausi*'s source of perpetuation is by seed, in the producing and maturing of which this floral giant makes one grand final effort, the cost of which is death. This plant would no doubt succeed over a large extent of territory.

THE LONGEST DAY IN THE YEAR.—Old miners stoutly maintain that on the longest day in the year the air in long tunnels and deep shafts stagnates. They say that their candles can hardly be made to burn and that they find it difficult to breathe. The air appears to be dead or deficient in oxygen. They declare that this is no superstitious notion, but a curious phenomenon that has been observed by all old miners, and say that it is no new thing, as miners have known of it for hundreds of years. They assert that on that one day the earth and the atmosphere are in about the same situation as the crank of an engine that has stuck on its center.

MINERS' CABINS IN ALASKA.—Miners find no difficulty in keeping their cabins warm and comfortable by making use of Russian ovens, which are very simple to build, as they are made of stone, in the shape of a large box-stove, from three to four feet long inside, from 18 to 20 inches wide, and the same in depth, with an iron plate on top to cook on. The chimney is built of the same material. Miners who wintered here last winter and the previous winter went out every day to cut their regular firewood, and so far no severe cases of frozen limbs have occurred. Indians travel and live in brush houses all winter. They subsist chiefly on dried moose, caribou meat and fish.—*Junco Press*.

FOUREROYA BEDINGHAUSI IN BLOOM.

decomposes much quicker than sodium hypsulphite, and, as shown in actual practice, a greater addition of hypsulphite to the solution is required to maintain it at one per cent when calcium than when sodium hypsulphite solution is used. As shown in many laboratory experiments at the Ontario, the average rate of decomposition of calcium hypsulphite solution was from 5 to 13 times as great as for sodium hypsulphite. In these tests, solutions of 2, 5 and 10 per cent were exposed in soup-plates at a temperature of 65 to 70 Fah. for seven days.

Tenthly, not only is the use of calcium hypsulphite disadvantageous as just described, if a strong solution is to be maintained, and, as shown further back, more expensive in time, labor and fuel, but also the actual cost of chemicals is greater per ton of ore treated. For instance, at Cusi, the comparison between a run of 1900 tons of ore, using sodium sulphide, and 1000 tons, using calcium sulphide, showed that the expense of chemicals alone required for calcium sulphide was 34 per cent greater per ton of ore treated than for sodium sulphide. If the cost of the labor and heat required were included, the difference would be still greater. At Sombrerete the comparison was made by Mr. Watson under the most unfavorable conditions for sodium sulphide, the cost of a pound of caustic soda at that place being over 30 times as great as caustic lime, yet the result of the test showed the superiority of the sodium sulphide.

d. The Objects of the Use of Sodium Carbonate or Soda Ash as a Precipitant for Lead ore.—First, the obtaining of the precious metal product entirely free from lead, thus decreasing the weight of product and cost of transportation, and, on the other hand, increasing the grade, and, to some extent, the rate paid per ounce of silver. At the Ontario, using a 1½

per cent, occupying only about one-quarter of the bulk of the same amount of lead in the form of a sulphide. The precipitate is pure white, and can be sold as it is for about the cost of precipitation or converted into litharge by exposure to a low heat.

Thirdly, the securing of a great saving in the amount and cost of caustic soda and sulphur used per ton of ore, and the ability to use solutions of any temperature and strength, which would otherwise be impracticable on account of the greatly increased amount of sodium sulphide which would be required to precipitate the greater amount of lead dissolved. The solubility of sulphate of lead in the hypsulphite solution increases directly as the strength and temperature. For this reason, the leaching by the old process is usually done with weak cold solutions, but, if the lead is precipitated by soda ash, the amount of lead dissolved is immaterial and the solution can be used at any strength and temperature. Besides, the cost of precipitating a pound of lead by soda ash is much less than by means of sodium sulphide. At the Ontario, using a stock solution of 1½ per cent, the net saving due to the use of soda ash in chemicals alone, without taking into account the value of the carbonate of lead, was 28 cents per ton of ore treated. With stronger solutions, the saving by the use of soda ash is much greater, with a 10 per cent stock solution being about \$2.80 per ton of ore. In short, the use of soda ash in the case of most ores secures a three-fold saving, viz: in express charges, in rate paid for silver and in cost of chemicals required for precipitating.

C.—General Order of Applying the Wash-Waters and Solutions.

The order of applying the solutions is treated

TABLE OF CONTENTS.

ILLUSTRATIONS.—Huntington's Improved Rock Breaker; Diagram Illustrating Principles of Blasting, 105. Fourcroya Bedinghaus in Bloom, 107. Charles Crocker, 109.

EDITORIALS.—The Principles of Blasting; The Huntington Rock Breaker, 105. Passing Events; Government Engineering Work; A Fair Division of Risks and Profits; Slow Mining, 108. Charles Crocker; Prof. Thomas Eggleston; The Late George J. Speck; California Machinery at Melbourne, 109.

CORRESPONDENCE.—Mines Around Murphys, Calaveras Co.; Leadville, 106.

MISCELLANEOUS.—Precious Metal Production, 106. The Russell Process; The Fourcroya, 107. Product of Comstock Mines; Working Tests by Russell Process, 111.

MECHANICAL PROGRESS.—Interesting Discussion in regard to Iron; Electroplating and Tempering; Steel vs. Wood; Substitute for Lignum Vite; Wanted; Improvement in Air Brakes, 110.

SCIENTIFIC PROGRESS.—Number of the Stars; Ancient Norwegian Horseshoes; Telegraphing by the Clouds; The New Photograph; Ancient Use of Lead; A Talking Clock; The New Comet, 110.

GOOD HEALTH.—Mental Effects of Hot Weather; For Rattlesnake Bites; Who May Treat the Sick; To Tea Drinkers; Smoking Leads to Blindness; Nourishment for Invalids; Scarlet Fever; A Remedy for Tender Feet; The Sunflower and Malaria; To Ward Off Intoxication; The Power of Habit, 111.

USEFUL INFORMATION.—An Important Use for Reindeer Hair; A Millionaire's Idea; The Sanitary Value of Pure Water; Useful Hints; How to Save Coal; An Expert Skater, 111.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 112-13.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 116.

Passing Events.

In the death of Charles Crocker this week, the Pacific Coast loses its greatest railroad-builder and one of its wealthiest men. In the building of the Central Pacific and Southern Pacific railroads, Mr. Crocker showed great skill and energy, and the rapidity with which the work was done was largely due to his personal efforts.

Washington Territory is just now attracting considerable attention from a mining point of view. Several new districts are being opened and developed.

The mining progress of Oregon is also greater than it ever has been. The Cracker creek region is quite promising, and other districts are being more vigorously worked than has been the case for years.

Boring for oil in this State has met with great success in the Southern counties. The petroleum industry here is rapidly growing.

The quartz mines of California are being developed in all directions. It begins to look now as if our quartz-mining industry was only in its infancy. Ores that a few years ago could not be worked are now treated with profit. The improvements in mining and milling are such that there is a promise of thousands of mines being worked profitably within the next few years.

It is understood that the arrangement between the French copper syndicate and the English Associated Smelters has come to an end, and that the syndicate is free to sell where and at what price it chooses, while the smelters must get their furnace material wherever they can.

Government Engineering Work.

The San Leandro Canal and Oakland Harbor.

Among the appropriations in the River and Harbor bill this year is one of \$350,000 for Oakland harbor, where nearly a million dollars has already been spent. The work already accomplished was the construction of the two parallel training-walls which form the approach to the harbor, there being a ship channel between them from the deep water of the bay to the estuary. A great deal of dredging has also been done in the harbor, of which the largest portion has been in deepening the Brooklyn basin, at the upper end, to form the approach to the canal which is to connect Oakland harbor with San Leandro bay.

The Government engineers have decided to use the appropriation of this year in commencing the canal. The area of San Leandro bay is much greater than that of Oakland harbor. The entrance to that bay is to be closed by a dam constructed in such a manner that the waters of the flood tide may enter, but on the ebb tide the water must find its way back to the main San Francisco bay and ocean, through the canal and Oakland harbor. In this way it is intended to keep the harbor at Oakland and its approaches from shoaling. The increased volume of water on the ebb tide is expected to effect a scouring action on the bottom, so that no shoaling will take place.

The appropriation will very shortly become available and then the engineers will advertise for a month for bids to do the work. There are not many contractors who will be able to undertake this work, since the dredging and excavating appliances must be large and expensive. There are several, however, who will bid on the work, among them Von Schmidt, Williams, Chaquette and a few railroad contractors.

The canal will be 500 feet long and 400 feet wide. It is to be out on a slope of 14 feet at high and 8 at low tide. The deepest cut on this line will be 24 feet. The first contract allowed will be for 4000 feet, which will bring the cut to the Fruit Vale crossing.

Last week the borings were completed along the line and the earth borings have been left for the examination of contractors. No rocks were encountered at all. The borings were made by means of common artesian apparatus, and were continued to a depth of 25 feet in each place. Part of the ground to be excavated is marshy, but most of it is solid ground. The top soil was black adobe; the next layer is a very white clay, three feet below the surface. This white clay is about two and a half feet thick. Then they found a gray sandy clay for about seven feet. Below this they struck yellow sand full of water. No blasting will be required along the line of the canal.

Part of the work will doubtless be done with steam paddies and cars, and when water is reached dredgers will be used. The approach to the canal on the Oakland side has already been dredged to a depth of eight feet at low water. There are eventually to be three draw-bridges—at High street, Fruit Vale avenue and Park street. These draw-bridges will be built of steel.

The first section of the work to be done from the approach to the Fruit Vale crossing will require the removal of about 800,000 yards of earth. Out of this 800,000 yards some 500,000 yards will have to be removed with steam paddies and cars. The earth removed will be utilized in filling in the low marsh lands nearby. The contractors themselves must provide a place for this material. Both sides of the canal will eventually be faced with stone.

Considerable dredging will have to be done in San Leandro bay, but this appropriation will by no means complete this part of the work on the harbor. The estimates for the canal, dam and bridges call for about \$500,000.

The bottom of the canal will be generally a yellow sand, with some clay, which will stand well. Temporary bridges will be put in where necessary until the digging work is completed. The general direction of the canal is S. E. and N. W., but there is a curve at the San Leandro bay end so as to make a good entrance. The canal, of course, follows the low ground.

This is the most important engineering work now being conducted by the Government on this coast. The harbor was commenced in 1874, and would have been completed long since had

money been constantly available. But our Government system of irregular appropriations works badly in this, as in other cases of river and harbor improvement. The harbor at Oakland is completely landlocked and perfectly safe at all times. So much money has already been spent that the work should be pushed to completion as rapidly as possible. This is the desire of the engineers, but they have to depend on Congress for funds, and sometimes a year or two has elapsed with no work because there was no money available.

A Fair Division of Risks and Profits.

The *Citizen*, published at Tucson, Arizona, tenders the mining claim holder of that section this bit of advice: "My friend, if you own a mine, and want to dispose of it at any reasonable price, open it up, and our word for it, if you can show a reasonable property you will not have to wait long for a buyer," with more of like purport. This is well-meant advice tendered, we fear, to very little purpose. We can readily understand how our confreres of the *Citizen* and the other millionaire capitalists of Arizona tire of aiding this impecunious and sometimes shiftless and little appreciative class of persons in opening up their claims, and would fain rid themselves of the burden. But how shall this be done, seeing the parties so admonished to hasten themselves have not the means even where they have the inclination to act on this good advice? As a rule they are barely able to perform the work required to hold their locations, let alone undertaking the work of their thorough development. They know full well what is required to put these properties into marketable shape, nor can any amount of editorial prodding increase their desire to have this done. However goaded, they cannot accomplish the impossible. As well, now that the day of miracles is past, say to the bed-ridden arise and walk, as to counsel these men to pitch in and open up their claims if they hope to sell them.

It would be more to the purpose were investors encouraged to buy these "prospects" just as they are; supposing always that they can be obtained at a price proportioned to their apparent merit. And here is where a trouble too often comes in; the claim-holder, with nothing valuable in sight, or perhaps only a scanty showing of mineral, demanding and expecting to get an extravagant price for a property lacking the important element of assured value. He is apt to be carried away with the idea that he has a mine, whereas he has only a place for a mine, and not always a good one at that. Seeing a chance to realize on his intangible and shadowy possessions, he allows his cupidity to get the better of his judgment, and so defeats what chance he might have had to effect a sale of the same, had he been less greedy and exacting.

What then is required is that the capitalist and the claim-owner should get nearer together at the start, the one showing a more just appreciation of these embryotic mines and the other hearing in mind that they are embryotic.

Let there be a proper division of labor, the would-be investor, instead of hunting after "indications" himself, buying those that have already been found, while the prospector, with his superior fitness for that sort of work, continues his search for these oft delusive signs of wealth, turning them over when found to the man of money to be exploited with the somewhat uncertain results that always attend these mining ventures. In short, the parties to this class of transactions should show a general willingness to share their hazards as well as their profits in fair proportion.

At the Red Canyon mines, Utah, a few days since, the wire rope broke, letting the loaded cars run down the slope. The rush down was terrific. Trains, coal, and a mule that was caught and killed, were all mixed in an inextricable and jammed-up mass at the bottom. Strange to relate, such a dust was raised, mixed with natural gas, that an explosion took place. Two men, Sandy Fowler and William Seggett, were killed, and the other men more or less injured. The damage was soon repaired and the working of the mine resumed.

In many of the mines of Butte, M. T., the system of payment has been changed from pay by the day to the contract system of payment per car of producing ore.

Slow Mining.

We had a conversation the other day with a mining engineer whose business caused him to travel among the mining regions, and he informs us that he hears numerous complaints about miners' work. He says that there are frequent instances where the miners receive good cash wages, but work so slowly that the contractors pay more money than they ought to in proportion to the work accomplished. In too many instances the men seem to take no interest in the work, simply thinking of the wages they are to receive.

Some mine-owners give as a reason for employing Chinese that they can count on exactly the amount these men will do in a day; that there is no disposition on their part to shirk work. While, of course, they are unable to do as much as a white man, still, while employed, they work steadily and constantly. On the other hand, white miners will go on in such a listless manner that they will only drill about four holes a day when they ought to be able to drill six or eight if industrious.

It may be stated that these remarks are based on observations made in some of the coast counties where mining is not conducted so vigorously, perhaps, as in the mountains, and where the average efficiency of the miners is not as high. Where extended mining operations are carried on the lazy men soon get weeded out, and those that do a fair day's work for a fair day's wages are the ones that get steady employment. It does not take a mining superintendent or foreman very long to "spot" a man who shirks his job or spines it out. Such people are found in all occupations, but few of these are successful at any.

Laziness is a physical attribute of some men, just as stupidity is a mental one of others. Many men are born lazy, and by a studious cultivation of their natural gifts obtain a certain distinction in that line. But such a reputation is rather detrimental to a man's material advancement in any walk of life. It is soon found out and he is not badly wanted anywhere. A general charge of laziness or slowness, however, will not "stick" in the case of California miners. As a class, they are energetic and have some pride in their work. Of course the chronic prospector, though he works hard at times, has frequent intervals of leisure and cannot be said to be as hard-working as the miner who works for wages. The latter class have plenty of competitors among their fellows, and they must "keep their end up" in the work in progress or some one in authority will soon find a way to dispense with their services. Although labor is supposed to be noble, few men do it voluntarily, whatever the theory may be. But it becomes a custom with those regularly employed and of steady habits to keep steadily at work in working hours.

The dredging-boat for mining the bed of the Carson river will soon be at work. The *Lyon County Times* says the boat is 80 feet long and 30 feet wide; the boilers are two in number and of 50-horse power each; the engine and hoists are capable of handling 50 tons at a lift. The pipes through which the material will be raised from the river-bed are 12 inches in diameter, and 600 tons is 10 hours' work for this machine. The engine is 40-horse power, and the pump capable of lifting 150,000 gallons per hour. Two large redwood tanks, eight feet in diameter, are intended as reservoirs, by means of which a steady supply of water may be had for sluicing purposes.

JOHN MACKAY has spent \$250,000 in the wire-rope system of transmission, and \$500,000 has been spent to bring water for power on the Comstock. By the expenditure of probably \$100,000 more the system of power introduced will bring ore assaying about \$2 less within the range of profitable reduction.

WHILE workmen were engaged in excavating for a sewer on Montgomery street, in this city, black sand was found, which, on being prospected, showed colors of gold. The place was about the location of the old beach of Yerba Buena cove.

FOUR six-horse teams which have been hauling coal from the mines at Slack's canyon, Monterey county, for some months have been taken off, and it is surmised that the Southern Pacific Co. will secure control of the mines and run a railroad into them.

Charles Crocker.

The death of Charles Crocker, which occurred at Monterey this week, removes from his work one of the great railway builders of the world, and one who has long been prominently identified with industrial matters on this coast. It was he who took the first contract of 18 miles on the Central Pacific railroad, and continued as superintendent of construction until the road was finished.

Although Mr. Crocker had accumulated many millions some years before his death, he began life in humble walks. He was born near Troy, N. Y., in 1822, on his father's farm, and when nine years old was a newsboy, afterward becoming a news-agent in Troy. He then went to Indiana and worked on a farm, and afterward worked as a hand in a lumber-mill. He also became an apprentice in a forge to learn the manufacture of bar iron and mined for a time in an iron mine in Marshall Co., Indiana. When the gold excitement broke out he came to California, across the plains, arriving in Sacramento in August, 1850. For some time he worked in the placer mines in El Dorado county, afterward opening a store there. When he removed to Sacramento after his experience in the mines he opened a dry-goods house, which he conducted for some ten years, selling out to devote his capital to the prosecution of work in building the Central Pacific railroad.

It was during the six years that he remained at "the front" as superintendent of construction that he achieved an enviable reputation as a railroad-builder. He showed wonderful ability in organizing forces and handling men and materials. His energy and perseverance were remarkable. The difficulties besetting the undertaking were very great. The road had to be built across a chain of mountains where the lowest pass was at 7000 feet elevation, and the desert plains beyond were scarcely less inviting. He succeeded in laying railroad track faster than it ever had been done before, and the record of one particular day, ten and a quarter miles of track, has never since been equaled. During some of the time of the building of this road Mr. Crocker personally had charge of from 10,000 to 12,000 men.

Mr. Crocker has for years held high official position in the two transcontinental lines and the branch lines on this coast. Mr. Crocker, in addition to his constant private benefactions, has contributed to many public objects and charities. He presented the money—\$31,000—for the building of the Boys and Girls' Aid Society in this city, and paid for the building of the drive to the park. At the time one of his buildings here was burned and two firemen lost their lives, he sent \$5000 to their families. He joined with Governor Stanford in presenting the California Academy of Sciences the Ward Natural History Collection. To the same institution he presented \$20,000 as a fund the interest of which should be spent in giving employment to such persons as have, by their devotion to scientific pursuits, incapacitated themselves from active business life. The fund has already been of great service to needy scientists. It is known as the "Crocker Scientific Investigation Fund."

The engraving on this page is a good portrait of Mr. Crocker, as it was made from a photograph taken not long since. Mr. Crocker leaves a widow, three sons and a daughter. One of the sons is third vice-president of the Southern Pacific Co., another is a banker in this city, and the third is owner of a cattle ranch in Ne-

vada. The daughter is married and now lives in New York. The residence built in this city by Mr. Crocker is one of the finest on this side of the continent. He was a munificent patron of art and owned many fine paintings. Mr. Crocker was possessed of a kindly heart and took great interest in his men. He was very industrious and persevering and a man of great activity. His integrity was unquestioned. It is not too much to expect, in view of Mr. Crocker's vast wealth and his charitable disposition, that it will be found he has provided in his will for the distribution of some of his estate in public benefactions.

Prof. Thos. Egleston.

We received a visit this week from Prof.

Prof. Egleston had no opportunity to visit any of the coal mines on this coast, but he is of the opinion we should use the coals we obtain for making gas for fuel. He thinks that our industrial future depends upon the use of gas fuel, and that this question should be more carefully studied in California. In fact, he thinks that in 50 years from now no solid fuel will be used anywhere, gas alone serving the purpose.

Some of the engineering inventions of California are destined to be adopted in other countries, more especially those things connected with hydraulics and hydraulic mining. The Pelton water-wheel is, in his opinion, the most important invention made on this coast, and the wonder is that the principle had not before been discovered. Prof. Egleston hopes to gain

organization was perfected. He was a member of the Executive Committee and vice-president from the time the society was started until failing health prevented his taking an active part in the proceedings. He contributed a number of papers to the Transactions of the society, among them a paper "On Sediment-Bearing Streams," "Railroads Across the Alps," "The Goldschmidt Aneroid," and "On Earthwork," etc. He was also a member of the American Society of Civil Engineers. In the Technical Society he took a hearty interest, and was a constant attendant at its meetings as well as one of the most prominent in carrying on its affairs.

Mr. Specht was agent here for Col. Waring, and when that gentleman obtained the contract for carrying out the sewer system of San Diego, Mr. Specht went to that city as engineer in charge. The state of his health, however, prevented his continuing, and after a few months he returned to San Francisco, where he has been since. For some years he occupied offices with Col. F. Von Licht and G. F. Allardt, at 318 California street, where many civil engineers were in the habit of frequently calling. Mr. Specht was a young man of ability in his profession, and was respected by all who knew him. He was a student who kept watch of new features in his business. Several articles from his pen have appeared in the MINING AND SCIENTIFIC PRESS in the last few years. His many friends deeply regret the cutting short of his career. He leaves a widow but no children.

California Machinery at Melbourne.

California will be well represented at the great Melbourne Exhibition. In all probability the largest single exhibit will be made by a California firm, Parke & Lacy of this city. They have sent over several separate plants of mining machinery in addition to wood-working and other appliances.

The mining plant is quite complete and shows three different and distinct systems. One of these plants consists of a three-foot Huntington mill with copper plates and Frue vanners. There is a jigging plant consisting of a set of Wall rolls, three trommels, two three-compartment jigs, classifiers and slime and sand tanks. There is also a Dodge mill and concentrator; and a dry-concentrating jig of the Dodge pattern. There is a Dodge rock-breaker and Giant rock-breaker for crushing ore for these different plants, and elevators to carry the material so that the whole process of working the ore can be seen. This machinery is all arranged so as to be seen during the exhibition.

It may be stated in this connection that at the Euriovie tin mine, near Silverton, N. S. W., Parke & Lacy have placed a complete plant for treatment of tin ores. At this place the Wall rolls are doing very good work, as they also are at the famous Mt. Morgan gold mine, Queenstown.

For the United States exhibit at Melbourne Messrs. Parke & Lacy have sent over a large amount of wood-working machinery representing the following manufacturers of that class of goods:

Witherby, Rugg & Richardson of Worcester, Mass.; H. B. Smith Machine Co., Smithville, N. J.; H. L. Beach of Montrose, Pa.; Goodell & Waters, Philadelphia; Greenlee Bros. & Co., Chicago; John A. White, Concord, N. H.; S. A. Woods Machine Co., New York. This exhibit includes planers, matchers, lathes, and all sorts of wood-working machinery of the most improved patterns.

In this exhibit are also Diamond drills of the M. C. Bullock Manufacturing Co. of Chicago; Knowles' steam pumps; Ingersoll rock-drills and air-compressors; a Cyclone windmill made in this State and of a pattern now largely in use, and one of Wagner's complete roller flour-mills, made in this city.

Representing as they do so many firms, Messrs. Parke & Lacy are enabled to make a splendid exhibit of American machinery of various types and forms. Many other things have been sent from California, but this is the largest single exhibit. This firm has branch houses in Portland, Oregon, Salt Lake City, Utah, Butte, M. T., and Sydney, N. S. W. It has in this city one of the finest establishments for the exhibition and sale of machinery on this coast.

A SHIPMENT of 1000 pounds of quicksilver was made last Thursday from the Gypsy mine, in San Benito county.

THE LATE CHARLES CROCKER.

Thomas Egleston of the Columbia School of Mines, New York, who has come to San Francisco after a visit to Alaska. He has now gone on a short trip to Yosemite and from there will make a tour through the gold mines of this State. It is his intention to collect material for the second volume of his work on "Metallurgy of Silver, Gold and Mercury of the United States." Before leaving, he made a visit to the New Almaden quicksilver mines in Santa Clara county. Since his visit to these mines some 14 years ago, he finds wonderful changes; there being scarcely anything remaining of the works which were in existence at that time. Even the paper by Professor Christy, written a few years ago, does not give a complete description of the works.

While in San Francisco, Prof. Egleston visited the Pacific Rolling-Mills and the Union Iron Works. He says that he has been all over the English shipyards and in the great works at Newcastle and the Clyde, but has never seen any superior plant to that of the Union Works. He has great respect for Mr. Irving Scott's genius and executive ability.

much information during his trip among the gold mines in California, where he will examine the mines, mining machinery, etc. He hopes to establish sampling works in New York before long with all the appliances, so that students may gain some practical knowledge of milling, etc., before leaving their studies.

The Late Geo. J. Specht.

George J. Specht, a well-known civil engineer, died on Sunday last in this city. For the past year his health has been failing and for many months his mental troubles have been such as to prevent his attending to any business whatever. Mr. Specht was only 37 years of age at the time of his death. He was always an active man and in addition to his professional pursuits has written much for the press. He has contributed many articles to the German newspapers concerning engineering features of this country.

Mr. Specht was one of the founders of the Technical Society of the Pacific Coast, and in fact it was mainly due to his efforts that the

MECHANICAL PROGRESS.

Interesting Discussion in Regard to Iron.

At a recent meeting of the British Iron and Steel Institute, some very interesting discussions took place. We briefly refer to several:

Oil-Tempering.

Mr. Edmonds of the Royal Arsenal, Woolwich, announced that exhaustive experiments were then being conducted at Woolwich Arsenal as to whether oil-tempering is good or not. Mr. E. H. Carbutt, president of the Institute, had grave doubts as to the efficiency of oil-hardening. In his opinion it would in the future be a question more of annealing than of oil-tempering.

Experiments with Lead-Hardening.

Mr. Gandier stated that he was making experiments with lead-hardening, the results of which he hoped to be able to make known in a few months. He had every reason to hope that this new agency would afford an opening for the application of steel castings for guns.

Cast or Forged Steel for Guns.

At the same meeting a very interesting debate sprang up in regard to the material for field guns. Major L. Cubillo of the Spanish Artillery Ordnance Works, Trubia, in a paper entitled "Steel Castings for the Manufacture of Guns," described the experiments which he had pursued in the view of ascertaining whether, owing to the high prices of steel forgings for the manufacture of guns, it would not be possible to produce trustworthy artillery from steel castings. The conclusion at which Major Cubillo arrived he expressed thus: "While the possibility of manufacturing great flawless steel castings may not be completely established, and while a casting by tempering at different temperatures may be capable of acquiring the characteristics of steel forged and tempered, yet the latter material must be used in the construction of guns." Major Cubillo also contributed a second paper upon

Excessive Testing of Steel Guns.

Mr. B. Walker of Leeds entered a protest against the waste involved in the wholesale destruction of guns for testing purposes. In manufacturing steel forgings he advocated the use of the press instead of excessive hammering. Hydraulic Process or the Steam Hammer.

In a discussion of this matter, Mr. Walker, though the largest manufacturer of steam hammers in the world, expressed the opinion that the hydraulic press would be the machine of the future. Sir Henry Bessemer said that the hammer was subject to many disadvantages. The *vis inertiae* was an effectual barrier to the force of the blow being transmitted right through the metal. On the other hand, the slow pressure produced by the hydraulic press acted on the whole body throughout.

Mr. Adamson, the president, said they must still feel there was a good deal to do in improving processes when a manufacturer had to cut off 35 per cent of an ingot at the top and 5 per cent at the bottom before he could use it for artillery purposes. He ventured to say that that disadvantage did not exist when the hydraulic press was employed.

Scrap-Melting in Cupolas.

Mr. Fred Gautier (Paris) contributed an interesting paper upon "The Melting in Cupola Furnaces of Wrought Iron or Steel Scraps, mixed with Ferro Silicon." He remarked that the introduction of ferro-silicon, which has been watched with a good deal of interest in metallurgical circles, had provided us with a new alloy that had the power of converting a white pig into a gray one, and which was well adapted for the majority of foundry uses. The chief disadvantage appeared to be that of cost. Experiments, however, demonstrated that ordinary wrought-iron scrap, and especially of the smallest kind, which could be had at a very low price, yielded probably as good results as castings made with ordinary steel scrap. In this case gray metal was obtained of a close grain, and very sound castings which were homogeneous and absolutely without blow-holes.

As a substitute for steel castings Mr. Gautier insisted that a proper appreciation of the metal's resistance to shock—double that which was obtained from ordinary cast iron—would make it appear that there was a special market for such castings, which might, at a comparatively low price, be substitutes for the steel castings generally employed.

The Prince of Wales

Takes especial interest in improvements in this as well as all industrial enterprises, and upon motion of Mr. Daniel Adamson, he was elected an honorary member. He had previously signified that such an election would give him pleasure.

The Projected Visit of the Association to This Country.

Reference was made to the invitation received last year from two prominent American members to visit the United States this autumn, and satisfaction was expressed that upward of 300 members, or about 23 per cent of the whole, notified their intention of being present. The council possessed the most cordial assurances that the American iron and steel masters would be ready to make the postponed visit successful when the best time for an American meeting arrived.

CARE TO BE USED IN FORGING AND HARDENING STEEL.—When great care has been taken in heating a straight piece of steel, and putting it into water or other hardening compound, and it comes out crooked, the trouble is entirely in the forging. One of the most important things in the handling of iron or steel is the heating. Many think that any one with no judgment or experience can make a heater. This is a bad mistake. Long pieces of steel, such as reamers for boxing boxes for axles, are generally forged under a trip-hammer. Suppose the piece of steel to be forged is evenly heated through. The blacksmith takes the bar in one hand, and in the other his hammer, and the helper holds his sledge ready for business. The smith turns the bar back and forth, never turning it entirely over. Now the hammer and the sledge will draw out the fiber or grain of the steel faster than the anvil. The steel is unevenly forged, and very likely will not be straight, but will be made straight across the anvil. Heat this piece of steel as evenly as possible, and put it into water or other compound, and it will very likely be crooked when hardened. If a piece of steel is heated evenly, and hammered equally as many blows on all sides, and if, when crooked while forging, it is straightened by hammering, then, with care and in heating, it will generally come out straight, providing the same care has been used before it comes to the blacksmith, which is not always sure.

ELECTROPLATING AND TEMPERING.—At the second meeting of the Association of Mechanical Engineers at Nashville, the question, "To what extent does electroplating reduce the temper of highly hardened steel?" was discussed at some length, and reference was made to the peculiar and apparently causeless breakages of pieces of tempered steel. Mr. G. R. Stetson mentioned a curious instance of a small piece of steel which broke apart at night while lying in the shop and the fracture of which showed no flaw or weakness of any sort. He also advanced the theory that the molecules within the steel kept altering position and adjusting themselves for an indefinite length of time. Mr. A. K. Mansfield referred to a case of a die made of steel exploding spontaneously, and other similar instances were related. As to the effect of electroplating on the temper of steel, no members expressed any very decided views, while a number questioned whether there really was any such effect produced. Another question discussed was, "How much should be removed from the edges of punched or sheared steel plate to cut away the injured metal?" Mr. J. T. Hawkins described his experiments with a belt made of steel strips, and the plan he adopted of simply rounding the corners of the strips to prevent their cracking.

STEEL VS. WOOD.—It seems until recently to have been quite an unobserved fact that good hardwood, in proportion of weight, is much stronger than steel in resistance to breaking weight. Moreover, when an all-steel machine is brought into sharp contact with some unyielding obstacle, its frame is liable to spring, and when once sprung its usefulness is at an end. It cannot be straightened without resort to the shop for repairs. If a wood frame, it is not thus affected. If bent under a violent strain, it at once springs back to its original shape. A piece of steel one foot long and a half inch square weighs double as much as a piece of seasoned ash one foot long 1½ inches square. In other words, the steel, in proportion to bulk, is 15½ times as heavy as the wood. A steel frame of a machine which is one-fifteenth as large as a wood frame weighs exactly the same as the wood. But even with this difference in size, the wood has four times the strength. These are simple problems which every one can solve for himself.

SUBSTITUTE FOR LIGNUM VITÆ.—Lignum vitæ has long been used on the stern tubes of steam vessels and for other bearings exposed to considerable pressure. M. Stockhardt of Leipzig, however, has recently patented a process of treating ordinary soft wood so as to be fit for those purposes for which lignum vitæ has hitherto been almost exclusively used. The soft wood in question is first impregnated with oil, after which it is subjected to great pressure, causing a considerable increase in the density of the material. Thus prepared the artificial is said to have all the properties of good lignum vitæ.

WANTED.—A material for fastening knives or forks into their handles is much needed. The best cement which is used for this purpose is made by melting one pound of colophony, bought of any druggist, and eight ounces of sulphur. It may be kept in a bar or reduced to powder. Take one part of the powder and mix with iron filings, fine sand or brick dust and fill the cavity of the handle; heat the stem of the handle, then heat the stem of the knife or fork and insert. When cold it will be found to be firm in its place.

IMPROVEMENT IN AIR-BRAKES.—Eighteen years ago, when the air-brake was tried, it required 18 seconds to apply it to a train 2000 feet long. Four years later the time was reduced four seconds. Recent experiments with the air-brake on freight trains show that it can be applied to every car in a train of that length running at the rate of 40 miles an hour, and that this train can be stopped within 500 feet, or one-fourth of its own length, and all this without any serious jolting.

SCIENTIFIC PROGRESS.

Number of the Stars.

Prof. Holden of the Lick Observatory says in a late number of the *Century* that the total number of stars one can see will depend very largely upon the clearness of the atmosphere and the keenness of the eye. There are in the whole celestial sphere about 6000 stars visible to an ordinarily good eye. Of these, however, we can never see more than a fraction at any one time, because a half of the sphere is always below the horizon. If we could see a star in the horizon as easily as in the zenith, a half of the whole number, or 3000, would be visible on any clear night. But stars near the horizon are seen through so great a thickness of atmosphere as greatly to obscure their light, and only the brightest ones can there be seen. As a result of this obscuration, it is not likely that more than 2000 stars can ever be taken in at a single view by any ordinary eye.

As telescopic power is increased, we still find stars of fainter and fainter light. But the number cannot go on increasing forever in the same ratio as with the brighter magnitude, because, if it did, the whole sky would be a blaze of starlight. If telescopes with powers far exceeding our present ones were made, they would no doubt show new stars of the twentieth and twenty-first, etc., magnitudes. But it is highly probable that the number of such successive orders of stars would not increase in the same ratio as is observed in the eighth, ninth and tenth magnitudes, for example. The enormous labor of estimating the number of stars of such classes will long prevent the accumulation of statistics on this question; but this much is certain, that in special regions of the sky, which have been searchingly examined by various telescopes of successively increasing apertures, the number of new stars found is by no means in proportion to the increased instrumental power. If this is found to be true elsewhere, the conclusion may be that, after all, the stellar system can be experimentally shown to be of finite extent and to contain only a finite number of stars. In the whole sky an eye of average power will see about 6000 stars, as I have just said. With a telescope this number is greatly increased, and the most powerful telescopes of modern times will show more than 60,000,000 stars. Of this number, not one out of 100 has ever been catalogued at all. * * * In all, 314,926 stars from the first to the 9½ magnitudes are contained in the northern sky, or about 600,000 in both hemispheres. All of these can be seen with a three-inch object glass.

Ancient Norwegian Horseshoes.

A few days ago the Norwegian Government authorized the opening of a hill at Gokstad known as the "King's Bound," with a view of discovering what might be buried therein. The mound was so named from a superstition that it contained the remains of some old Norse king. The real contents, however, were a Viking ship, the bones of some old Viking king, the bones of 12 horses, saddle remnants, and a number of horseshoes. The mound in question was 170x150 feet in height. Judging from the character of the deposits, scientists place the date of deposit between 700 and 1000 A. D., during the later iron age, the first period being during the first seven centuries.

Of course, our interest is mainly with the horses and the shoes. The horses were some young and some aged, over high, smaller, apparently, than the ordinary Norwegian horse of the present day, but of the same race as the *fiord* horse. The small size of the horse may throw some light on statements of a historical nature which have heretofore been considered fabulous. For instance, the great Norse leader, who 150 years before the conquest led into France the colony that founded the Norman race, was called "Hrolf, or the walker," because he was "too tall and too stout for any horse to carry."

The horseshoes were of iron, but, says Mr. Nicolaysen, the scientist, "horseshoes proper were brought into use among the Norwegians at a much later date, nor were they known to the Romans, yet curiously enough they are everywhere seen on the Bayeux tapestry—one of the many evidences of the inventive genius of the Norman. It was the custom in those days to bury with a dead Viking his horse, dog, etc., but never before were so many animals found as at Gokstad."—*Century*.

TELEGRAPHING BY THE CLOUDS.—Admiral Sir W. Hnnt Grubbe has recently made some interesting experiments at the Cape of Good Hope on the sending of signals by means of the rays of an arc lamp reflected by the clouds. The luminous fascicle from a 100,000-candle arc lamp was directed against the clouds by means of a reflector, and interpreted according to the heliographic code. The dispatch could be read with ease at Cape Town. Other engagements were made by a vessel of the navy sent out to sea, and the signals could be read from a distance of 50 miles. This method affords a possibility of sending signals at sea, and might prove useful in favorable weather for ships in danger.—*La Lumiere Electrique*.

BEFORE THE REVOLUTION America had not declared her scientific independence. Practical necessities required the employment of astronomical observers to settle boundary disputes,

a confusion of landmarks having grown out of Old World habits. There were disputes everywhere between the colonies. In 1767 the proprietors of Maryland and Pennsylvania sent to England for two astronomers to determine their common parallel. In response to this came a former assistant to Bradley, Mason by name, and Dixon with him as assistant, the first trained observers ever employed in the United States, and whose work was the first piece of accurate measurement in this country.

The New Phonograph.

It is said that a company has purchased all the Edison and Tantor patents on the new and improved phonograph, and intend to make it a great monopoly to be used by the public only on the payment of a large price. The company purposes to imitate the Bell Telephone Company in scraping up the money of its patrons. That the phonographs will be rented, not sold, and a large interest charged on four or five times their cost.

There is no doubt but that the improved instrument is far better and more useful than the original invention of Edison; but it is extremely doubtful if it is so indispensable that the proprietors can put a fancy price upon its use as is done with the telegraph or telephone. They have no real substitutes, but the phonograph can readily be substituted in all the uses to which it may be put. Profitable monopolies on inventions cannot be sustained except when there is no available cheaper substitute. No matter how perfect the instrument may be, it commends itself more in a sentimental point of view than in any other way.

There is an idea that it will be used as a permanent record of spoken language; but it must be borne in mind that such a field of usefulness is very limited, as in these days almost all transactions of importance are evidenced by writing or printing. It would be in vain to try to substantiate the evidence of a phonograph for a written contract or agreement, or for a letter of instructions or a power of attorney; and if it is intended to use it for the impeachment of a witness, it may be said that that can now be done without it. Appearances are that it will be an interesting scientific toy, but anything further than that is as yet quite problematical. It is no doubt a very pretty scientific toy, but not, like the telephone and telegraph, an indispensable requisite in business. A reporter who recently examined one of these instruments speaks of it as follows: We saw a phonograph which was mounted upon a small table. Producing one of the tubes upon the surface of which were minute dotted lines, the operator said: "A lady was here the other day and sang to the instrument. If you will listen you can hear a reproduction of her voice." The reporter listened and heard: "If a body meet a body coming thro' the rye." Then followed a German song by the same lady. The operator said that the instrument could repeat either of the songs 5000 times if the reporter could spare the time to listen.

ANCIENT USE OF LEAD.—The ancients, like the moderns, used lead to fasten iron into stone, to give a glaze to pottery, and as a help in the manufacture of glass. Very singular were the "imprecation tablets, surreptitiously deposited in tombs, and sometimes even in the coffin of the deceased, that a curse might follow him to the other world," which seem "to have been more frequently deposited by women than by men." Vitruvius describes elaborately a vast aqueduct, the lead in which would cost to day two millions. The leaden bullets of the ancient slingers often bore an inscription in relief such as "Appear," "Show yourself," "Desist," "Take this," "Strike Rome." The Greeks were especially fond of bullets with such mottoes, and they have been found upon Marathon and many other famous fields.

A TALKING CLOCK.—Edison has invented a new dinner clock which talks; instead of striking the hour it speaks it. At dinner-time a voice issues from the clock and says, "Dinner-time," also "1 o'clock," "2 o'clock," etc., as the case may be. Another device which he is perfecting in connection with the clock is that of a female face, which he purposes to set in the face of the clock. The lips of this figure will move at the hour, the head will bow and the fictitious lady will say: "Good evening, ladies and gentlemen; it is bed-time."

THE NEW COMET.—A new comet was discovered on the 7th instant by Prof. W. R. Brooks of the Smith observatory, at Geneva, N. Y. It was found to have a slow easterly motion; is quite bright, but not visible to the naked eye. It was first seen in Ursa Major, just above the star Lambda. The discoverer says it has a large head and short tail, which last, unlike other comets, points directly toward the sun.

TELEPHONE RATES are comparatively light in Sweden. At Orobo, for instance, the subscriber pays an annual rental of but \$4 and gets the use of a telephone system extending 100 miles into the country.

THE REASON why distant objects appear closer just before rain is that the air gets damp just before rain, and damp air is more transparent than dry.

GOOD HEALTH.

Mental Effects of Hot Weather.

One of the most interesting studies bearing upon the subject of the relation of mind to matter is found in observing the effects of a high temperature upon different organizations. The nervous, sensitive, egotistic man, when the thermometer ranges among the nineties, is chiefly intent upon publishing his personal discomfort. Instead of sitting still and cooling his mind through work or genial diversion, he moves husily about telling everybody how hot it is, with gestures and ejaculations to match. He is a mental radiator, bent upon transmitting his own conditions to other minds, and without intending it is generating his own discomfort within others.

On the other hand, the man of even temperament, of cool mind, avoids all mention of physical and thermal conditions on a hot day. His purpose is to get his mind as far away from them as possible. He hears his nervous friend fling down his pen or spindle and declare that it is too hot for work. To him congenial work is the very best means of keeping his attention away from physical discomfort. One feels comparatively cool in this man's presence. He is a partial refrigerator, and transmits his own conditions.

The mere physical temperature of a man on a hot day is not the measure of discomfort. In this busy season hundreds of New England farmers toll in open fields in the hot sun in such excessive perspiration that hardly a dry thread is found on them through the day. But if one is accosted from the roadside and reminded that it is a terrible hot day, he will generally reply with true Yankee drollery that it is splendid weather for corn. The farmer's mind is on the hay and corn crops instead of the heat. His mind is kept cool by congenial labor and the promises of good crops.

What is true of man is true of beast. One of the most painful sights to a person of kind heart is to see the distress of the horses that pull the street-cars on a scorching day. These animals receive the heat of care and treatment by the companies, and their muscular strength is not overtaxed so far as mere work is concerned. A horse doing the same work on a country road would not perspire much. It is the tremendous strain upon the nerves caused by constant fear of losing their feet on the smooth paving when starting the car that chiefly induces their sweat and semi-torture. Even with a horse it is the condition of mind that largely decides its power to endure heat and work.—*Boston Globe*.

For Rattlesnake Bites.

The following recipe for the cure of rattlesnake bites is from the *New York World*. It is said to have been obtained from a Delaware Indian about the beginning of the century, and has been used by the Geer family, of Little Eddy, N. Y., for upward of 80 years past, with famous success:

Apply to the wound a poultice, one-half each of common salt and indigo, mixed with cold water, and renew every two hours. Eat freely of the leaves, or drink often of a tea made from them of a variety of the blue violet (*V. angustata*) commonly known as the "arrow-leaved" violet. If the bite be upon the leg or arm, bind the leaves in a circle around it, above and just beyond the swelling. Moistened with cold water as often as they get dry from the fever created by the poison, and renew two or three times a day.

WHO MAY TREAT THE SICK.—The Act of April 3, 1876, amended and supplemented by the Act of April 1, 1878, prohibits any person from practicing medicine who shall not first have obtained a certificate of competency from the Board of Examiners. This board consists of seven members appointed by the Medical Society of California, the Eclectic Medical Society of California and the California State Homeopathic Medical Society. A person who may be granted a license to give massage treatment is not thereby constituted a physician, nor authorized to practice medicine, and for such person to practice medicine would be to incur the penalty prescribed in the law. In a case of emergency, where immediate attention is required and medical aid is not at hand, experienced persons may do what is necessary to sustain the patient until a physician can be summoned. The intention of the law is to suppress quacks, empirics, nostrum vendors, *et id.* The penalty for a violation of the law is a fine of \$50 or imprisonment for six months, or both.

TO TEA-DRINKERS.—Whoever drinks tea let him do so in moderation. Do not take it between meals on an empty stomach. Allow it to form a part of the regular meal. Make the infusion by steeping—never by boiling. Those who are troubled with insomnia should not use it in any form. Brainworkers cannot afford to overwork on the stimulus of strong tea. The poor and scantily fed cannot afford to touch it. To dyspeptics we say, tea aggravates your trouble, and many cases are cured by disusing it. Persons troubled with constipation should not use it, either weak or strong.—*Table Talk*.

SMOKING LEADS TO BLINDNESS.—"Tobacco-smokers," says the *London Medical Mirror*, "must look to their eyes." Proofs are accumu-

lating that blindness, due to slowly progressive atrophy of the optic nerves, induced by smoking, is of frequent occurrence. In one of the volumes of the "London Hospital Reports," Mr. Jonathan Hutchinson has narrated several cases of amaurosis, the histories of which go to establish the fact that in such cases the blindness was brought on by that rapidly increasing, and, as it appears, baneful habit; and in the *Medical Times and Gazette* of a late date, the same distinguished surgeon has described another striking case of "tobacco amaurosis, ending in absolute blindness, induced in 18 months."

NOURISHMENT FOR INVALIDS.—The very best nourishment for invalids and children is the juice pressed from a steak or a mutton chop thoroughly trimmed and boiled about five minutes. The meat for this purpose should be cut at least three-quarters of an inch thick. The juice may be extracted from the meat by a lemon-squeezer or a meat-press, which comes for this purpose.

SCARLET FEVER is a specific poison which emanates from the person of the patient, and can be caused by no other means. Diphtheria is contagious, but may arise from fermenting filth, etc. Typhoid fever and Asiatic cholera are not directly communicable from person to person, but are spread by the dejects of their victims, which contaminate the water supply.

A REMEDY FOR TENDER FEET is cold water, about two quarts, two tablespoonfuls of ammonia, one tablespoonful of bay rum. Sit with the feet immersed for 10 minutes, gently throwing the water over the limbs upward to the knee. Then rub dry with a crash towel, and all the tired feeling is gone. This recipe is good for a sponge bath also.

THE SUNFLOWER AND MALARIA.—It has been stated that since the sunflower has been cultivated on certain swamps of the Potomac, malaria fever has decreased. At the month of the Scheldt, in Holland, it is stated that similar results have been observed.

TO WARD OFF INTOXICATION.—A French doctor, who has been searching for a method to ward off intoxication, recommends before drinking "an appropriate amount of food of albuminous and fatty nature," particularly cheese.

THE POWER OF HABIT.—When the nervous system has long been habituated to any habit, as of certain stimulants, and to certain circumstances at certain periods of the day, the whole system seems to expect these changes at these respective times.

USEFUL INFORMATION.

AN IMPORTANT USE FOR REINDEER-HAIR.—Life-saving apparatus of reindeer-hair has been contrived and successfully experimented with by a Norwegian engineer, it being proved that such hair is capable of supporting a weight ten times its own. Experiments were made in one case with a life-saving object which could be used on board ship as a chair, bedstead or couch, but which, in case of need, may be converted into a small boat. This apparatus was found capable of supporting three full-grown men in the water, although only intended to hear two. Another trial was with a suit made entirely of reindeer-hair, covering the entire body, except the face, in which a man floated on the water without having to make the slightest movement. It was also found wholly impossible to dive in the dress. A door-mat made of this hair was found to support a man easily, although he was dressed in full outdoor clothing. On comparing life-belts made of reindeer-hair with similar ones made of cork, it was found that the former are much lighter than the latter—a very important advantage to an exhausted drowning person when it has to be put on in the water.

A MILLIONAIRE'S IDEA.—A New York millionaire is having built a suite of rooms on top of the lofty Equitable building, over 200 feet above the sea level. The apartments are reached by a flight of gilded iron steps. The suite consists of three rooms—a parlor, dining-room and bath. All are to be carpeted and crowded with costly bric-a-brac. The little suite of rooms is provided with oval windows four feet in diameter, and will be lighted by electricity and furnished with steam-heaters for the winter months or any opportune cold wave that may break in upon the summer's heat. This superb apartment is the highest in point of elevation from the ground level of any similar suite of rooms in the world. In the hottest day in summer breezes blow in the altitudinous parlor and make a sojourn there quite as enjoyable and cooling as a siesta in the mountains under the shade trees.

THE SANITARY VALUE OF PURE WATER.—Nature's safe cure for kidney diseases—and many others—is strictly purified water. So important to health is strict purity in water that it may be reasonably presumed that one of the causes of the remarkable increase in kidney complaints is in the increasing impurity of water consequent upon our multiplying population, manufactures, etc. Says Professor Charles Mayr: "Of the thousands of chemical compounds and waste products formed in

the human system, many require pure water for their solution and elimination, and water so overloaded with salts, etc., as average well water, will not work satisfactorily. Those who have never drunk pure water do not realize what an effect such water has upon the kidneys. Its effect is better than that of acetates, nitrates, opiates or alcohol, and for people with a tendency to kidney disease or dropsy there is no better drug than pure water."

THE following are those who are engaged at present in the manufacture of olive oil in this State: Ellwood Cooper, Santa Barbara, Santa Barbara county; Frank A. Kimball, National City, San Diego county; Colonel George F. Hooper, Sonoma, Sonoma county; Edward E. Goodrich, Quito Olive Farm, San Jose, Santa Clara county; J. R. Wolfskill, Winters, Yolo county; Juan Callegos, Mission San Jose, Santa Clara county; E. W. Holmes, Riverside, San Bernardino county; General John Bidwell, Chico, Butte county; Dr. H. H. Clark, Auburn, Placer county. There are others who have large plantations, and many others who have in recent years embarked in the business and have largely planted olive trees, but as yet have made little or no olive oil, the fruit being used for pickling purposes. Many new orchards have been planted in the interior valleys. These trees are young and many have begun to bear fruit this year. There is no doubt that in a few years there will be an abundance of olive oil produced in this State, as all these plantations are doing exceedingly well and are planted on soil well adapted to their culture.

USEFUL HINTS.—It is better always, when cleaning zinc under a stove, never to wet it, but rub often with a dry, clean cloth. When necessary to wash it, avoid using soap. Do not leave any tomatoes in the bottom of a tin can, but pour into an earthen bowl till you want them. This applies to nearly all canned vegetables. A good cement for mending a stove that has a crack in it may be made by mixing soluble glass with wood ashes. This cement will not bear moisture. A lump of soda left on a drain-pipe down which waste water passes will prevent the clogging of a pipe with grease, especially if the pipe is flooded every week with holling water. For poisoning from phosphorus, as when children suck matches, give a tablespoonful of magnesia, and then, freely, gum arabic water; less magnesia if only a little phosphorus is taken. Don't allow any loose-jointed gas brackets on your premises which could be swung against wood-work, or any brackets without wire screens or glasses, if hay, straw, light materials or window-curtains are near them.

THE New Westminster (B. C.) *Columbian* says the adaptability of the Puget sound fir to fine car work is replacing the higher-priced walnut and Louisiana ash, as well as West India mahogany. For some time past the Royal City Mills, New Westminster, have been shipping sill timber to the largest car works in the United States, and new orders are constantly being received from them—a sufficient proof of the satisfaction the lumber gives. A short time since four carloads of sill timber were shipped to the Crossen Car Works of Coburg, Ontario, the first of a large order just received. The timber is all 65 feet in length, of the best quality, and not a knot or flaw will be found in any stick of it. This lumber will be used by the Crossen works on the palace and first-class cars now being built for the Canadian Pacific Railroad.

HOW TO SAVE COAL.—Take coke, soft coal and wood; mix the coke and coal in equal proportions. The great heat of the coke will entirely consume the smoke of the soft coal, all of which passes off when that coal is burned by itself. A little dry wood added to the fire occasionally will also effect some saving. Fuel thus used will be found much more economical than either used separately. This information may be of special use at this time, while our California coal barons are putting their heads together to keep up an artificial price for coal. The writer got ahead of them by pulling out his old brick range and substituting an Elmwood range, purchased of Anderson & Tallon, No. 12 Market street.

THE JUG is a most singular utensil. A pail, tumbler or deoanter can be rinsed, and you can satisfy yourself by optical proof that it is clean; but the jug has only a hole in the top, and the interior is all darkness. No eye penetrates it; no hand moves over the surface. You can clean it only by putting in water, shaking it up, and pouring it out. If the water comes out clean, you judge you have succeeded in cleaning the jug, and vice versa. Hence the jug is like the human heart. No mortal can ever look into its recesses, and you can only judge of its purity by what comes from it.

AN EXPERT SKATER.—The Emperor of Austria, Francis Joseph, has a country seat in Vienna, and on this fine royal estate is a lake which in winter is used as a skating pond. During one of the latest Austrian "cold snaps" an expert Vienna gentleman went skating there, with a little reservoir of ink adjusted to the hock of his skate in such a way as to allow the ink to flow out in a fine steady stream. Then off he started, and before he had skated long there appeared the name of the Crown Princess beautifully and plainly written upon the ice.

Product of Comstock Mines.

Following is a statement of the ore and bullion product of the Comstock lode mines for the quarter ended June 30, 1888, obtained from the official reports of superintendents now on file in the Assessor's office:

Con. Cal. and Virginia

Produced 40,463 tons of ore, yielding a total of \$1,027,294.89 in bullion; average yield per ton, \$25.33; actual cost of extraction, transportation and reduction, \$614,419.92; net yield above cost of production and subject to bullion tax, \$412,874.97; total bullion tax on net proceeds, \$12,386.25.

Ohollar

Produced 4750 tons of ore, yielding a total of \$74,507.24 in bullion; average yield per ton, \$15.65; actual cost of extraction, reduction and transportation, \$11,983.74; cost of production above yield, \$7,476.50; no tax.

Confidence

Produced 17,285 tons of ore, yielding bullion valued at \$401,293.18; average yield per ton, \$23.85; actual cost of extraction, reduction and transportation, \$239,898.18; net yield above cost of production and subject to bullion tax, \$161,395; bullion tax, \$5648.83.

Hale and Norcross

Produced 18,075 tons of ore, yielding bullion valued at \$451,740.08; average yield per ton, \$25; cost of extraction, transportation and reduction, \$305,883.13; net yield above cost of production and subject to bullion tax, \$145,856.95; bullion tax, \$4375.70.

Yellow Jacket

Produced 7080 tons of ore, yielding bullion valued at \$55,022.04; average yield per ton, \$7.80; cost of extraction, production and transportation, \$38,333.03; cost of production above yield, \$33,310.99; no tax.

Recapitulation.

The total number of tons of ore extracted during the above quarter, according to the above statement, was 77,653 tons, producing bullion valued at \$2,009,812.43. The product of the Savage is not included in the above list, which will swell the total to \$2,529,000. The product of the last quarter of the current year exceeds that of the yield of the preceding quarter by nearly \$600,000.

Working Tests by Russell Process.

Arrangements have been made by which ores, tailings, etc., may be treated experimentally on both a small and large scale by the Russell process. Treatment on a large scale should be preceded by tests made on a small sample, for which the charges will be as follows: Raw material for raw treatment, \$8; material already roasted, \$8; raw material for roasting treatment, \$10; raw material for both raw and roasting treatment, \$15.

The sample, weighing at least 20 pounds, and crushed not coarser than through an eight-mesh wire screen, should be addressed, prepaid, to W. A. Wilson, Marsac Mill, Park City, Utah. The treatment desired should be specified.

In case it is desired to have tests made on a working scale, carload lots of ore (in sacks) for raw treatment, of roasted ore, or tailings, will be treated at an expense to the shipper of freight charges only. The grade of the ore is immaterial. In all cases the product will be retained by the company making the test.

In the case of raw ore requiring roasting, the value of which is less than \$34 in silver and gold, there will be a charge for treatment depending upon the grade of the ore. Such sample lots will be treated in a Stetefeldt furnace, and as this will cause an interruption in the regular work of the mill in which they will be treated, there would be less profit to the company on ores lower than the above grade.

Parties desiring to have their ore tested by raw leaching, preliminary to concentration, can have the tailings from the leaching returned to them for further treatment.

LIFE IN THE MINES.—In some countries it would seem strange for a party going to see a theatrical entertainment to make a dive into Mother Earth, travel four miles under the mountains and then dart up to the surface within a stone's throw of the ticket office, but it is after such a fashion that some of our people go for their regular dose of drama, comedy or tragedy. Last night a party of ladies and gentlemen of the town of Sutro, who wished to see "The Two Johns," at the Opera House, took the short subterranean cut. Starting at the mouth of the Sutro tunnel (at their own doors), they came up the tunnel to the C. & C. shaft, a distance of a little over four miles. Dismounting from their cars they then hoarded the cages in the shaft and were shot upward to the surface a vertical distance of 1640 feet. This way of going to a theater is as much fun for our ladies as going to a picnic. It is really a pleasant trip, but until a lady has become somewhat accustomed to life in the mines it requires a little nerve. It is fine and cool the whole four miles of the way underground. The cars will not soil even the most delicate dresses of silk and satin, therefore there is no trouble about changing clothing. In her room at the mouth of the tunnel a lady may stand before her mirror and give the finishing touch to flower or feather, and in just such shape as she turns from her glass she is shot up to the surface in this city, ready to take a seat in her box in the Opera House.—*Virginia Enterprise*.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

LIVERMORE COAL CO.—*Livermore Herald*, Aug. 9: A contract for sinking the Richards incline to a 300-foot level was signed on Sunday last, and work begun on Tuesday. The contractors are two practical miners from Mt. Diablo. The incline is 8x9 in size, being thus somewhat higher than the vein. Two shifts of men will be run, working night and day. Each shift consists of an engineer, tub-man, and two miners. In this manner the incline will be put down about six or eight feet a day. There being considerable water, the work will be continued without intermission, until completed. A boarding and lodging house is now being erected, near the mouth of the incline. Parties who have visited the mine during the past week say the vein is looking exceedingly well, being now five feet thick, and all good coal.

Amador.

SUTTER CREEK.—*Cor. Amador Ledger*, Aug. 11: The little mining that has been going on here has been brought to a standstill on account of the failure of the water supply. Mr. Stewart has shut down for lack of water to run the mill, and the Iowa or Sutter Creek mine has hung up stamps for the same reason. At the Wildman mill will shut down, as it was found difficult, if not impossible, to keep the mill going and sink at the same time. It will probably be some months before we hear the sound of stamps in motion again.

PLYMOUTH.—The town is very quiet, owing to so many of the miners having gone away to seek employment at other mines, some of them taking their families along with them, and others leaving them here, intending to return as soon as the mine starts up again. There is a great variety of opinions about when the mine will start. Some say this fall, but others think that it will not be in running order again. We do not hear any more talk about putting up a mill on the New London mine, although the general report is that there is a good lead of ore in the mine. The Lady Bedford mine is still sinking, and reports are that some rich rock is being taken out of the mine. Reeves & Way are sinking a shaft on their mine, and we hear are finding some rich float rock as they go down.

MILL BURNED.—*Amador Ledger*, Aug. 11: The five-stamp mill on the Reed and Askey claim near Irishtown was utterly destroyed by fire on Thursday morning of last week. The owners have already purchased a five-stamp mill in Calaveras county, and have started in to repair the disaster. It is proposed to build a ten-stamp mill, using the five stamps of the old mill. It is intended to operate the mill by water-power by means of a large undershot wheel placed in the canal, which runs close by, thereby reducing the cost of motive-power.

El Dorado.

CUT RICH ORE.—*Placerville Observer*, Aug. 7: The True (Young Harmon) Mining Co. has been engaged for several years running a tunnel to strike their ledge. During the past week they cut some very rich ore of a sulphide nature, showing some free gold. Some of this ore is estimated to pay \$2000 per ton. The tunnel is now in 1400 feet, and at the point where they find this rich ore they have 700 feet of backs. This strike should stimulate the Big Tunnel Co. to action, as their tunnel must in time crosscut this same ledge. It is reported that the True company will start up their mill before long.

LACK OF WATER.—*Placerville Observer*, Aug. 11: The running of the mill at the Chic and Ohio mine has been suspended for a time, on account of water. They intend putting in steam-power, having ample water for all other purposes. We understand that the Gopher Boulder M. Co. of Kelsey district will begin extensive operations as soon as Supt. Pearson arrives from England. The new concentrators at the Josephine mine have been put in place, and work in the mill will be resumed at an early date. Mr. Raw, superintendent of the Independence mine, near El Dorado, exhibits some very rich ore taken from a new shaft on that mine 20 feet deep. This old bullion-producer may come to the front again after so many years. The gold is there.

WILL COMMENCE.—*Georgetown Gazette*, Aug. 9: We understand that the Gopher Boulder Mining Co. of Kelsey district will begin extensive operations as soon as Supt. Pearson arrives from England. I. A. Woodbury has been overseeing the placing of the new concentrators at the Josephine mine. The Kentucky tunnel, owned by A. J. Wilton, is now 800 feet in length and is now into a fine body of gravel. This on the same channel from which Mr. Wilton took his "gold potatoes" a few years ago, and we expect to hear of him taking out some more in the near future.

Inyo.

PROSPECTING.—*Index*, Aug. 9: Sam Gruber and Julius Schroeder have gone to Kearsarge mountain to do assessment work for Henry Levy on the Cleveland mine, formerly the Silver Sprout. They will also prospect some in that vicinity.

POLETA.—*Inyo Independent*, Aug. 11: George Story is finishing up two or three small lots of ore at the Maxim mill. The ore was taken from the Poleta and one or two claims in the same neighborhood. The yield of gold is about the same as usually found in the same claims.

CONCENTRATING.—Frank Fitzgerald has had constructed a machine for concentrating fine ore and fine dust which is a success. He has on hand some 1200 tons of material which he will concentrate, and which promises good returns.

CERRO GORDO.—Jack Dunphy and his partner, O'Keefe, are shipping 60 tons of ore they have taken out at Cerro Gordo. The lot was gathered in little dabs and has been a long while accumulating.

DARWIN.—Darwin is very quiet at present. The low price of lead discourages miners. Lead is admitted from Mexico free of duty under the fiction that it is silver ore, and as wages in that country are extremely low, our own lead miners are driven from the market. J. C. Eddy is not operating any mines at present; he says nothing can be made in the mines under the present conditions. A little ore is taken from the Defiance mine, but very few men

are at work there. At the Lucky Jim Mr. J. A. McKenzie has a few men at work, but not much is doing. Mr. C. Anthony has got a renewal of his lease of the Haggin mine, over in the Slate Range, and will do a good deal of work there as soon as the weather gets a little cooler.

Nevada.

AIR-TUNNEL.—*North San Juan Times*, Aug. 11: Messrs. Cral and Trood are working steadily at their gravel-dredging in the American diggings. They have been doing considerable deadwork lately in the way of running an air-tunnel. This ventilator is the second they have been obliged to put in, but when finished it will repay them for its construction by facilitating greatly their drifting operations, which have heretofore been retarded by the slowness with which the powder smoke from their blasts left the working-tunnel.

STRUCK BEDROCK.—*Transcript*, Aug. 9: At three o'clock Tuesday morning the perpendicular shaft being sunk at the San Jose drift mine in Washington township, 16 miles northeast of this city, struck bedrock near the south rim of the channel at a depth of 250 feet. There is five feet of barren gravel on the bedrock which is pitching off rapidly in a northerly direction. Wm. Adams and Mr. Hargis, who had the contract for sinking, began there last November. Under favorable circumstances they would have completed the job ten weeks ago, but the flow of water has been so heavy as to delay them greatly. Mr. Adams telegraphed yesterday to the owners in San Jose that the contract is completed and to come up and accept the work. He thinks that a drift 150 feet in a northwesterly direction will penetrate the center of the pay dirt. The company has been operating there some four years and has spent upward of \$25,000. The prospect now is that they will receive big returns for their outlay. The San Jose is a mile south of the Centennial drift claim and is supposed to be on the same channel.

COPPER.—*Tidings*, Aug. 14: The old dump-pile of the Spenceville copper mine is proving a valuable bonanza to its owners. They say there is enough of copper in it to last for years without hoisting a pound of ore.

Placer.

FOREST HILL DISTRICT.—*Placer Herald*, Aug. 11: Jo Federer is taking out rich gravel at the Small Hope. P. Edwards and E. Richards have found very good indications in the Sebastopol. Their tunnel is in 230 feet; the gravel grows richer as they advance. C. Wason is running a new tunnel in the Consolidated Mammoth mine. He expects to run 400 feet to strike the channel. His claim is on the same channel as the Mayflower. The Baker Divide Co. is still running ahead. Andy Steel is running a tunnel into the Blackhawk mine. Breece & Wheeler are still running ahead; the gravel is getting richer. Work has been retarded by caves. The engine and boiler for the Dardanelles mine arrived on the ground last Sunday. As soon as possible they will be put in place. The mine had been paying big, until the failure of water necessitated the stopping of the mill. The engine is of 40-horse power, which is more than sufficient for ordinary purposes, but Gen. Hamilton thought it prudent to have a surplus of power.

San Bernardino.

DEATH VALLEY MINING PROSPECTS.—*San Bernardino Index*, Aug. 7: Messrs. D. C. Conkling and H. A. Thompson have just returned from the northern end of Death valley, where they have located a number of valuable claims which they describe as very promising. One of their favorite locations they named the "Friday" mine, from which an *Index* reporter was yesterday shown some very fine specimens. Mr. J. A. Shedd, the assayer at Colton, made tests of this rock, which yielded \$59.51 per ton in silver and lead. There being no antimony in this ore, it is not at all rebellious and will reduce easily. So far there has been but little development put upon these claims, but the indications all point to permanence and improvement as depth is reached. The country rock is of iron, capping a lime formation through which the fissures bearing the ledges have been broken. In the vicinity the two prospectors also discovered a large deposit of beautiful marble of the finest imaginable grain and texture. Specimens brought into San Bernardino are as fine as any Carrara marble ever put into statuary, the deposit they describe as a cliff formation, standing above the valley several hundred feet and located where it can be quarried at the least possible cost. With the investment of very little money, and rail transportation close at hand, the marble alone will be a very valuable property. The projected line of the Carson & Colorado railway runs within six miles of both the mining claims and the marble deposit, and the construction of that road will make them easy of access and profitable for operation.

Shafts.

OLD DIGGINGS.—*Courier*, Aug. 10: Frank Pantler, one of the partners in the Mammoth mine, Old Diggings, says the mine is looking fine. The new tunnel in the Mammoth will tap the ledge 150 feet lower than the present works. The ledge is 14 feet wide.

A SALE OFF.—A \$6000 cash sale of a mine was declared off this week because there was no Government patent to it, and a never-sweat loafer who never did a day's work on the ground stuck up a notice claiming part of it. The man of money said he didn't want to buy a mine and dispute for a clear title afterward. Therefore for want of expending a few dollars for Government title, a good sale was lost. Secure Government titles as soon as possible, for mineral, agricultural or timber lands; then you are secure, and know just what you possess.

BROWN BEAR.—*Redding Free Press*, Aug. 11: From Mr. P. Evans, who came in from Deadwood last Wednesday, we learn that the Brown Bear Co. has purchased the whole of the Gibson property—the Black Bear, Enterprise and the famous Little Gem—for \$30,000. Joseph Falin, who has honestly and faithfully worked the old Vermont mine, is at last reaping his reward; he is running a tunnel to tap his recently discovered ledge. He is now in about 150 feet and will have to go as much more before he reaches the ledge. It is farther south than any that had yet been discovered about the Vermont mine. Judge Stowell has just made arrangements for opening his silver ledge which lies about halfway between Iron mountain and Windy camp, and is about six miles from Copley. At the latter place he will put up a building, at the railroad track, in

which to store his ore previous to shipment. He has hired enough pack animals to carry a ton of ore a day. He will have a rock-breaker at the mine.

Sierra.

BUFFALO.—*Cor. Mountain Messenger*, Aug. 11: The indications at the Buffalo mine, Hog canyon, are very good at present. The company has developed the mine, and with the ore that is in sight a guarantee of the building of a mill this summer. They have a shaft down a distance of 50 feet with very rich rock at the bottom. Tunnel No. 1 has been driven 350 feet, and the pay chute was found at 300 feet. Tunnel No. 2 is now in a distance of 100 feet with the same indications as that of above the ledge. In No. 2 a crosscut has been run and shows very rich ore, which is of a decomposed nature and is good milling. Tunnel No. 3 will be started in a short time on the opposite side of the bill.

Siskiyou.

CRUSHING.—*Yreka Journal*, Aug. 11: The Warren quartz-mill, on Yreka flats, has just finished crushing a quantity of quartz taken from the Mills & Hart ledge of Humboldt gulch, but owing to the dangerous illness of Johnnie Hart, a cleanup has not yet been made to ascertain how much amalgam or gold has been realized. The Schroder and Werner ledges at head of Deadwood are now being worked with the great-st energy and success, some 14 hands being constantly employed. The miners at Hawk-insville and vicinity have been able to perform considerable work at mining this season, with a steady supply of water from the Big ditch, which has been furnishing more water steadily this season than during previous seasons.

Trinity.

QUICKSILVER.—*Redding Free Press*, Aug. 11: A. J. Lytle, the first discoverer of quicksilver mines in Trinity county, went up to the county this week to develop his quicksilver interests, which have for some time lain dormant.

Tuolumne.

MILL-SITE.—*Sonora Democrat*, Aug. 11: The grading for the 20-stamp mill at the Eureka mine is about completed. The site of the mill is close to the present hoisting works. We are informed that the bond on the Hyde mine has been forfeited, by reason of a failure of the negotiators to comply with its conditions. Two separate parties, one in San Francisco and the other in New York, are now negotiating for its purchase.

SUMMERSVILLE.—Summersville is expecting a large revival of prosperity, business activity and mining resumption in consequence of the early opening by a heavy company of the Eureka mine. This mine has not been worked since the early era of quartz mining in California. It ceased operations at a time when \$7 or \$8 quartz would not pay. Parties who worked in the mine then and have the knowledge whereof they speak, say that the Eureka was worked down to a depth of over 500 feet, and at that depth it was about 15 feet in width, had good walls and showed a fine quality of quartz. Subsequent progress in mining and attendant sciences have now made it possible to mine and mill ore that pays even but \$2 per ton. Therefore the above mine will now yield handsomely, and besides it will stimulate similar enterprises in Tuolumne. The New Albany mine, just across the river from the Eureka, is nearly a similar proposition. It has large bodies of ore, all of which will now pay well, and in addition it contains chutes known to be rich. The same company ought to own the two properties, as the same mill placed on the river could readily receive and work the quartz from both mines.

WORKING WELL.—*Independent*, Aug. 11: Mr. Frishie, who moved the mill that was formerly on the Experimental Gulch mine to his Sunnyside mines on the mountain-round above Columbia, reports that the mill is working finely—saving all the gold—in fact, doing all that the inventors claim for it.

BLACK OAK.—It is expected by the first of next week to have the Back Oak mine running by water-power, thereby saving a big expense to the company.

NEVADA.

Wahoe District.

OCCIDENTAL.—*Virginia Enterprise*, Aug. 11: Lower tunnel: 75 feet south of the north incline winze the upraise has been carried up 15 feet; total, 201 feet; 150 feet south of the same winze the south drift has been extended 7 feet. Have extracted 150 tons of ore, and shipped to Atlanta mill 125 tons; average assays of wagon samples, \$24.

HALE AND NORCROSS.—During the week have hoisted 702 tons of ore from the 600 and 700 levels, and have shipped to the Nevada mill 567 tons. Average battery assays, \$48.86 per ton. All the stopes throughout the mine are looking very well. The west drift on the 500 station has been advanced 40 feet. Have men on repairs in the main shaft and other parts of the mine. The bullion yield for the month of July will amount to about \$86,000.

SAVAGE.—During the week have retimbered 47 feet of the main shaft between the 800 and 900-foot levels. The south drift, 500 level, has been advanced 46 feet. No ore has been extracted since last report. The bullion yield for the last month, amounting to \$16,059.11, has been forwarded to the San Francisco office.

CHOLLAR.—The north raise from the 650 level is in ore of fair milling grade. The usual work progresses throughout the mine. The building in which to place the motors to receive the power from the Pelton wheels in the shaft is approaching completion.

GOULD AND CURRY.—During the week there has been extracted from the 250 and 300 levels and shipped to the Douglas mill 227 tons, 1305 pounds of ore, the average battery assay of which is \$24.47. Bullion on hand in assay office in Virginia of the value of \$2640.69.

CONFIDENCE.—General repairs throughout the mine are being carried on. We are shipping daily to the Brunswick mill for reduction 175 tons of ore, the average battery sample of which shows a value of \$22.27 per ton.

ALTA.—Are opening a new station in the Alta and running a drift to the west to cut the vein on the 725 level. Have built three reservoirs below the mill to catch the slimes and tailings.

YELLOW JACKET.—Are doing some good prospecting on the upper levels. The shaft is in splen-

did condition. It is as good as any other on the lode, and the cages never ran better in it.

ANDES.—Drifting west from the bottom of the winze on the 240 level, and running south on the 350 level. Both drifts often encounter occasional bunches of good ore, which is saved for milling.

CHALLENGE CON.—Work on repairs and prospecting continues as usual on the 1000 and 1100 levels. Some ore of fair grade is being developed on the 1000 level.

BELCHER.—The Suto tunnel drift is out 530 feet. The shaft is now open to the bottom, and is in good condition, with the exception of requiring new guides in places.

WEST YELLOW JACKET.—Stringers of rich ore coming in on the raise, and as soon as connection is made will commence to extract it.

CROWN POINT.—The 700 crosscut advanced 36 feet during the week through a mixture of quartz and porphyry giving low assays.

ALPHA AND EXCHEQUER.—Sinking and retimbering the main shaft below the 380 level. Prosecuting work on the 122 and 222 levels.

LADY WASHINGTON.—Running a northwest drift on the 725 level. The ground has the appearance of approaching vein matter.

BALTIMORE.—Some streaks and bunches of good ore are encountered on the 300 level, where the usual work is being done.

CON. IMPERIAL.—Repairs to the main north lateral drift on the 1100 level are still being continued.

BULLION.—Have started to drift south on the 640 level, and are crosscutting east on the 500 level.

SCORPION.—The south drift on the 500 level was advanced 12 feet during the week.

IOWA.—Everything in and about the mine is in good shape.

Eureka District.

NEW PAN.—*Eureka Sentinel*, Aug. 11: A new zinc pan is being put in at the Eureka Con. refinery in place of the old one, which was cracked. The damage was done while using it to make market lead, since which a new process has been used.

Hawthorne District.

GOOD REPORTS FROM THE MINES.—*Walker Lake Bulletin*, Aug. 8: The reports from the mines in Hawthorne district are cheerful. The ore is rich and abundant, and in the claims in process of development (so that systematic mining may be done when stoping begins) the prospects seem to be constantly improving. There is much talk in the newspapers about the rich discoveries in other places—Humboldt county, Tuscarora, Sierra City, etc.—but it is the belief of prospectors who have grown gray in the business that we have the richest gold quartz district on the coast right here in Esmeralda county. It is young and comparatively undeveloped, but in time, if present indications are realized, we will show a bullion product second to none. Several loads of ore from the New York mine, in Hawthorne district, have arrived during the past week, and more is coming. It will be shipped hence to the Kincaid mill for reduction. This mine is the property of Messrs. Knapp & Laws, but it is now being worked under a lease. The ore is rich and handsome returns are anticipated. The Kincaid mill is already crushing Lapata ore, and next week the stamps will begin dropping on rock from the New York, now in transit. The Pamlico will soon begin shipping, also the Cypress and Hartford, all in Hawthorne district, and the Ontario in Moss district.

Pioche District.

NEW LOCATIONS.—*Eureka Sentinel*, Aug. 11: In Pioche District, Lincoln county, 12 new mining locations were recorded the last week in July. The activity is due to the prospect of a railroad being built through that region next year.

Wild Rose District.

PARADISE MINE.—*Silver State*, Aug. 10: Frank and Charles Boskovich returned yesterday from a tour of observation in Paradise valley and Spring City. They say that a body of ore has been found in the Wild Goose mine, which belongs to the Paradise Valley Mining Company, and that Supt. McCurdy increased the force of miners last Wednesday. They say, too, that very rich ore has been developed in the Cliff mine, which is being worked by Todhunter & Frayer, but in consequence of the scarcity of water at their mill the ore cannot be worked at present. The Paradise Valley Co., under the management of Mr. McCurdy, has produced hundreds of thousands of dollars, a part of which has been paid in dividends to stockholders, and the balance, save what has been expended for machinery, paid to miners, and through them found its way into general circulation. It is within bounds to say that the Paradise valley mines have caused to be expended among the farmers and business men of this county an average of \$10,000 per month since it has been in operation.

ARIZONA.

GROOM CREEK.—*Cor. Prescott Courier*, Aug. 9: Groom Creek district covers ground drained by the creek lying south of Prescott and west of Walker district, and has within its limits a great number of mineral veins, which have produced a large amount of gold and silver, and are still so doing. The Standard ten-stamp mill, under the management of J. S. Jones, is running on Spruce mountain gold and silver ores; the stamp, crushing and concentrating mill is working custom ore. Several mines in this district turn out high-grade silver ore, considerable of which was formerly shipped to Colorado or San Francisco. The Benjamin, Adel and Nevada claims yield ores worth from 400 to 2000 ounces silver per ton. A promising group of claims adjoining on Spruce mountain, some half-dozen in number, have recently been patented and owned by an incorporation called the Montezuma Gold and Silver Mining Co. The average assay value of the ores runs about \$40 in gold and 40 to 60 ounces in silver per ton. Selected ores sold to the sampling works at Prescott have yielded over \$100 a ton. The mines of this district are the nearest productive mines to Prescott, six to eight miles distant. The district is easy of access by good roads, is covered with timber and has a more bountiful supply of never-failing water than many other sections, and is therefore looked upon as likely to be the site for the reduction works, which, in the near future, are certain to be erected at some suitable locality on

the line of railroad. Nothing but surface work has been done in this district; there is not a shaft 250 feet deep and very few 100 feet deep. Water is encountered everywhere, which stops the exploration of veins by the miner of small means. Enough has been done just to show the possibilities that exist of the presence of large and rich deposits of mineral in the veins already found and partially prospected, and to demonstrate the fact that Groom creek district is a field which offers good inducements to those with the necessary funds to prosecute the work of development on the promising prospects existing therein.

BRADSHAW.—Prescott *Courier*, Aug. 11: Tom Collins tells us that mines belonging to the Moody & Place and Ora Bella companies in Bradshaw, increase in size with every foot sunk upon them.

TIP TOP.—Miners of Tip Top district keep right along taking out rich silver ore and shipping the same to "foreign" smelters. They could ship their ores around the world and still get big pay out of it. It is the best choosing camp in the Southwest and has the best miners.

COPPER.—Large shipments of copper-silver bullion are constantly going east from Jerome, the big copper camp of Northern Arizona.

THE SILVER KING.—*Florence Enterprise*, Aug. 11: Mr. H. H. Noble, president of the Silver King M. Co., says the recent financial troubles of the company were more apparent than real, and resulted from an improvident indifference upon the part of its former management. The unusually large outlay for improvements in the milling facilities and the thorough exploitation of the mine, in conjunction with a run of several months upon a lower grade of ore, caused the outlay to temporarily exceed the product of the mill. The improvements have been about all completed, and while a greater measure of economy in the treatment of the ore will result, a gratifying appreciation in the value of the ore will swell the profits to a satisfactory figure. The output for the month of July aggregated 91,932 ounces of silver, and, barring accidents, the August product is expected to exceed these figures.

THE YUMA C. AND S. M. CO.—*Phoenix Herald*, Aug. 9: This company has been developing its claims in the Harecur mountains for the past two months with a force of 20 men. Working shafts are being sunk on the Fond du Lac, Black Bear and Cumberland mines. The shafts are sunk on the ore and thus far the result of development has more than justified anticipations. The deepest shaft at the present writing is 75 feet. It is the intention of the management to prosecute the development work until no possibility of failure can exist and then to erect suitable reduction works. The company will at once let a contract for sinking wells upon the property. It is intended to bore the wells and then introduce suitable lift pumps, such as are in use along the lines of the S. P. and A. T. & S. F. railroads. The character of the Yuma ore is copper glance with more or less feruginous chrysocolla with the addition of a small amount of limestone; the ore can be readily smelted in the ordinary Pacific water jacket.

BRITISH COLUMBIA.

THE NEW PLACER CAMP.—Donald *Truth*, Aug. 7: Enough is now known of Porcupine creek, which is but 18 miles from Donald, to prove it good placer ground. It is easily accessible from the railroad; the bedrock in places is not deep; the dirt gives returns almost from the grass roots, and there is plenty of water. Every man who has returned from the camp reports the discovery claim as unquestionably rich—good for \$20 a day to the man, at least. If that be true, there are other claims likely to be just as good. At present some 30 claims have been staked off and recorded. Lumber is being whipsawed for sluice-boxes, and the actual work of opening up claims is already under way. The trail in will probably be completed to-day.

WORK PROGRESSING AT FIELD.—At Tunnel mountain, three miles from Field, work is being pushed in preparing the ground for working the mine successfully, and ore will be shipped to Vancouver by September. A tramway to connect the mine with the railroad track is under way, the ore cars and other material being expected daily. John Barr of Anthracite has the contract for building bridges over the Kicking Horse between the mine and Field. The company has a large ore-body in sight, and as soon as they begin shipping in earnest, the outside world will awaken to the fact that there is at least one producing mine in the Kootenay district.

COLORADO.

LEADVILLE.—*Cor. Denver Tribune*, Aug. 9: The lease and bond on the Virginian property has been taken up. The parties leasing this claim have expended about \$40,000 exploring the ground in the last ten months, and as the bond was \$50,000 the owners agreed to reduce that sum considerably if the bond was taken up within 30 days. Accordingly it was raised this week. Development is being made rapidly upon this mine. The Brookland discovery on the Adams is being rapidly developed. The shipments average about 40 tons daily and the average runs net about \$33 per ton from the smelter. A level from the Maid of Erin mine has been extended into the Big Chief grounds. It is reported here to-day that the level will be extended to the Castle View property. The ore body which has been encountered is running over 50 per cent lead and about 40 ounces in silver. The Hamburg shaft on Breche hill, east of the Highland Chief, is being steadily worked by Woodrow & Co. This development, which is more than likely to prove profitable, will open up a piece of territory which has been idle nearly eight years, and from which ore was taken in the early days of this camp. Messrs. Jas. Doyle of this city and William Farrish of Denver are taking out some excellent ore from the Best Friend at the head of Big Evans gulch. The leasers of the Four Per Cent are still drifting with the hope that they will soon strike another valuable body of mineral. A strike was made yesterday in the Seneca shaft. Two feet of sand carbonates was discovered at the depth of 250 feet. Ground has been broken up for the concentrator to be put in at the Wolfstone mine. It is warranted to have a capacity of 200 tons per day. Considerable interest is being manifested in Leadville over the boom which the Horseshoe region is now receiving. Leadville is

the supply point for that country, and two coaches leave here daily loaded with passengers for Horseshoe. Eastern parties have leased what they believe will prove paying properties. Nearly all the available ground has been taken up. It is estimated that there are about 600 men prospecting and at work at Horseshoe. The Hilltop, Peerless and Last Chance mines are now shipping first-class ore. Over 50 teams are employed in hauling from the first of the above three mines.

DAKOTA.

MONARCH.—*Deadwood Pioneer*, Aug. 8: At the bottom of the Monarch shaft, now 150 feet deep, very good ore has been found. Supt. Bachman reports work going on steadily, progressing favorably, and that the appearance of the property is improving with every foot gained in sinking. The formation the shaft has now reached is similar to that in the great Homestake mine, viz., a talc slate. The shaft will be carried down another 100 feet, and when a total depth of 250 feet has been obtained, the permanent crosscut will be made. The Monarch Co. is one of the strongest companies operating in the Black Hills. The stock is held in large blocks, and by men of large means who are willing and able to thoroughly develop the property. The mine has shown excellent prospects from the first stroke of the pick at the surface, until now the shaft has reached the depth before mentioned. The chances are strongly in favor that the property will, before long, be not only upon a self-sustaining basis, but also in condition to warrant the erection of large stamp-mills to reduce the ores from which many dividends may ultimately be expected.

HARTSFELD SMELTER.—*Deadwood Pioneer*, Aug. 9: The long awaited coke for the Hartsfeld smelter at length reached Sturgis late Tuesday night, and was yesterday hauled to Galena. The little plant blows in this evening on ore from the Bullion and Merritt mines. During the period of enforced idleness many improvements were made, and the chances are that no necessity to close down for any purpose is likely to arise for some time.

ANOTHER SMELTER.—It was common talk yesterday that a company made up of Minneapolis and St. Paul capitalists are about putting up a 25-ton smelter at Galena. Report had it that work, grading the site, had already commenced. This was premature, though a well-informed broker states he has reliable advices that machinery for the plant has already been shipped. The men putting up the plant have lately become largely interested in the Silver Queen, one of the best mines in Bear Butte district, and the smelter will be erected to treat its ore.

IDAHO.

SEAFOAM.—*Ketchum Keystone*, Aug. 11: Thos. Tague returned from Seafoam yesterday and reports the outlook in the new mining district still very encouraging. The prospects for a rapid development of the country are improving. Pat Kelly has just had some rich float assayed and it went over 800 ounces. It was found on Float creek.

SHEEP MOUNTAIN.—John Dowling, a mine-owner of Sheep mountain, arrived here late Wednesday. Mr. Dowling says the prospects are very favorable for a sale of two mines out there—one, the Eureka, owned by Bonanza men, and the other owned by Hon. G. B. Baldwin. There are now about 250 men in the Sheep mountain country.

MONTANA.

IRON ROD.—*Inter-Mountain*, Aug. 6: Wm. Owsley is home from a visit to his gold mines at Iron Rod. He has two properties there and is getting them in pretty good shape for realizing plenty of profit from working them. His present work is devoted principally to developing. The ore body is about four feet wide and it is free milling, running about \$30 to the ton. The shaft is now below water level, and there is little likelihood of a change in the character of the ore. He is putting in two of the Candle stamps, each of which is supposed to have the capacity of about five ordinary stamps. They each weigh 950 pounds, and besides having a rapid motion—125 strokes to the minute—they have also a grinding motion which expedites crushing very much. They are probably started up by this time. The Iron Rod mine is a very rich property. It is opened to a depth of 600 feet and has plenty of ore. Mr. Owsley says the ore mills \$50 to the ton. They have a 16-stamp mill running regularly, and it is pounding out a pile of wealth. The Broadway is not in operation. Unlike the generality of ores in that section, the Broadway ores have become very refractory. There are a good many promising gold properties in this district, and Mr. Owsley expects to see a big output eventually from there. At present, however, the only mines that are being worked to any extent are his own and the Iron Rod.

DEAL FOR THE SILVER BOW GROUP.—*Butte Inter-Mountain*, Aug. 10: A big mining sale of Butte properties has been pending for several days and is now understood to be consummated, all that remains being to get up the necessary abstracts of title and make out deeds, etc. The properties concerned are what is known as the Silver Bow group of mines, of which A. J. Davis and James A. Talbott are the owners. They comprise the Gray Rock (silver-copper) and the Josephine, Sister, Flag, La Plati, Belle of Butte and others; also the Silver Bow mill. The purchasers are Boston, Philadelphia and Michigan men. The purchase price is said to be \$1,250,000.

THE NARROW GAUGE.—Irvine & Co., who have been at work sinking on the Narrow Gauge for the past three months, having now reached a depth of 175 feet are running a level to catch the chute of ore which was worked out above the 110-foot level. They already have a streak of very rich ore in the face of their drift six or eight inches wide, and it is widening.

THE SITUATION.—*Inter-Mountain*, Aug. 11: In mining circles during the past week several important events have been recorded. The negotiations for the purchase of the Silver Bow group of mines, embracing a score of properties, are understood to be progressing favorably. The Bluebird is now in better shape than ever. The addition of a cylinder furnace to the mill increases its capacity to 130 tons, which amount is now being daily treated. Nothing

has been heard from the Lowlands during the week, but it is known that the Anaconda people have secured some more property there and are sinking the Ruby shaft with all possible expedition, and with three eight-hour shifts of the best miners they could procure. The Barton Consolidated concern turned out 2,000,000 pounds of copper for July, and have enough money in the treasury to pay a second dividend of \$200,000.

NEW MEXICO.

MINING LOCATIONS.—*Southwest Sentinel*, Aug. 7: From the first of January to July 31 there have been placed on record and filed for record 600 mining locations in the office of the clerk and recorder of Grant county. This number represents an area of 12,000 acres of mineral land, half as large as Gilpin county, Colorado. The annual expenditure on these, as required by law, involves an outlay of \$60,000. The locations have been made, a majority of them, on hitherto unexplored territory. The number on which the annual assessment of one hundred dollars worth of labor and improvements will be expended to hold them, will amount to about four-fifths of the whole. This labor and development, if development it may be called, is accomplished without the aid or assistance of outside capital and represents discovery, the primary step in mining. Usually the first year's work on a prospect is of the nature of a promise, and not until the second, third, or fourth year of constant labor, is that promise fulfilled, and often not then, unless perchance the prospector is exceptionally lucky and makes a ten-strike at grass roots.

CENTRAL.—Mining matters are quiet at present, but indications are very favorable that operations will soon be resumed on the famous Gulch mine and other properties of note in this district.

TELEGRAPH.—Competent authorities assert that with present facilities "ten-dollar rock" can be made to pay handsomely, over and above every item attendant upon the expenses of milling. The mill is in first-class condition, and the ore in sight in the various mines belonging to the estate is sufficient to run the mill for several months.

LEGAL TENDER HILL.—The iron ores now being mined on Legal Tender Hill are regarded as a very superior quality of fluxes, and as the demand for this quality of iron is increasing steadily, it is among the probabilities of prospecting that the quarrying of these iron ores for fluxes may lead to the discovery of exceedingly rich deposits of silver-bearing ores in this famous treasure-vault of the Chloride mountains.

WHITE QUARTZ.—Camp is 22 miles south of Silver City, and three miles east of the Big Burro Peaks. The mines have been located for several years past, and the developments and millruns, which have been made prove that this portion of Burro mining district is one of the three known gold areas in Grant county. A steam arastra furnishes the milling facilities, and the percentage of the values saved by the primitive method of arastraining, ranges from 80 to 95 per cent of the assay.

NOT SUCCESSFUL.—Silver City *Enterprise*, Aug. 10: The new-fangled mill erected by the Cleveland Mining and Milling Co. of Shakespeare is not a brilliant success. The mill after a run of a few hours was hung up—apparently to give it a rest. Col. R. N. Alexander of St. Louis, who is interested in mines in the San Simon district, proposes to erect reduction works on his property. The mines are situated six miles south of the railroad in the Stein's Peak mountains. The Volcano mine, which created such a commotion one year ago and suspended operations rather suddenly, will resume work very shortly. P. B. Smith of Deming having gained control of the property will assume charge.

MOGOLLONS.—Captain Cooney was in from the Mogollons this week and reports that Silver creek, upon which his mill depends for water, is entirely dry, something unusual for this season of the year. The captain's mill is shut down for the present, but will be started up as soon as there is water in the creek. While running the captain takes out an average of about \$500 per month with a five-stamp mill, employing only two or three miners.

VARIOUS CAMPS.—*Western Liberal*, Aug. 9: The Volcano mine, north of Stein's Pass, will start up soon. P. B. Smith, the principal owner, will assume charge. Frank Reno continues development on his Robert E. Lee mine at Pyramid. He is down 40 feet on his new shaft and is drifting both ways. The vein is widening. Last Saturday Supt. Foster came in from Gold Hill with a brick which weighed eight or nine pounds and was worth about \$2400, the result of the July run of the Standard mill, five stamps. Besides this brick the mill produced about \$1400 worth of concentrates. The Bachelor mine improves as more work is done in it. The main shaft on the footwall is down 175 feet and there are about 300 feet of levels run. The shaft is down about 60 feet and they are just starting a level. The mine has paid its way so far, and with a mill it would be a bonanza.

MINE MISMANAGEMENT.—Old Leitendorf, or Pyramid as it is usually called, possesses many truly good properties, which, if properly managed, could be made producers. Constant litigation, coupled with the fact that the best mines are owned by non-residents, has tended greatly to prevent development. The Last Chance, one of the oldest claims in the camp and a producer from the grass roots, has been lying idle for several years. The Pyramid Mining and Milling Co.'s property still continues undisturbed in its Rip Van Winkle sleep. The magnificent 20-stamp mill erected at a considerable outlay of capital is fast becoming a total wreck. All of this loss and decay can only be attributed to the folly of placing in charge, as managers of the properties, persons who, however competent in other walks of life, know nothing comparatively of the business they undertake to manage.

OREGON.

QUARTZ AND PLACER.—*Jacksonville Times*, Aug. 9: Work has been suspended at the Col. Iribledge for the present. Green Bros. of Galice creek are running a 150-foot tunnel to tap their ledge lower down, and are well along with their work. E. Sanderson Smith has several men at work on Gold Hill and is making good progress. Anton Rose, who rented Ennis & Cameron's placer claims in Galice creek district last season, recently cleaned up with good results. Henry Ankeny, who has been working the Saltmarsh diggings on a large scale during

the past season, will commence cleaning up soon. Wright & Pankey, of Willow Springs precinct, have struck another pocket of exceedingly rich quartz, and have one of the best ledges in Southern Oregon. Mr. McIntosh, who claims to represent California capitalists, is in Josephine county for the purpose of bonding a large area of placer mines in Grave creek district. Messrs. Goff, Davis and other miners from that section were at Grant's Pass the forepart of the week for the purpose of arranging the preliminaries. Reub. Jones and Johnny Coyle, who purchased a large quantity of tailings from Green Bros. some time since, sold them in Portland, after concentrating them. They paid about \$600 and sold them for over \$4000. This is more evidence that the quartz from that ledge is quite rich in sulphurets as well as in free gold.

THE HERCULEAN SOLD.—*Bedrock Democrat*, Aug. 7: Yesterday the sale of D. C. Probasco's interest in the Herculean mine at Cracker creek was recorded, the purchaser being A. H. Manning of San Francisco. This makes Mr. Manning the owner of two-thirds of the property. The transfer is an important event, for it carries with it the fact that a gentleman with sufficient means to fully develop the property and put up a mill is at the head of affairs. The Herculean will now take rank among the great properties of Baker county.

THE NEW EL DORADO.—Parties in from Cracker creek report that section as lively to a remarkable degree. About 75 men are now given steady employment at the Eureka and Excelsior mine, besides the hundreds of men now building houses and engaged in the various lines of trade. Any day in the week scores of teams can be met on the road either loaded with supplies or containing emigrants to that section.

UTAH.

REVIEW.—*Salt Lake Tribune*, Aug. 10: The week has seen the closing down of the Hanauer smelter, and so all the smelting operations in this valley are now stopped for the present. It is to be hoped that the railroad freights (the unsatisfactory nature of which is the open reason for the closing of the smelters) may be soon arranged on a better basis. The receipts in this city for the week ending Aug. 8th, inclusive, were \$47,993.02 in bullion and \$37,894.02 in ore, a total of \$85,887.04. For the previous week the receipts were \$88,349.09, of which \$50,888 was bullion and \$37,461.09 was ore. The Ontario product for the week was of bullion 22,178.05 fine ounces; from ore sales, \$20,875.93, an approximate total of \$43,054.08. For the month of July the Ontario product was 91,037.44 ounces of fine bullion, and \$56,616.98 from ore sales; an approximate yield for the month of \$147,654.42. The Daly output for the week was of bullion, 10,128.28 fine ounces; from ore sales, \$4634.49; a total, approximately, of \$14,762.77. For the month of July the Daly output was of bullion, 51,312.96 fine ounces; from ore sales, \$9948.82, an approximate total of \$61,261.78. The Horn Silver is dormant, both in Utah and New York. No ore product is reported. The base bullion receipts for the week were to the value of \$42,993.02. The Hanauer smelter produced during the week bullion valued at \$6200. Ore receipts in this city for the week were to the value of \$25,494.02 by Wells, Fargo & Co., and \$12,400 by McCormick & Co.

CAMP CROSSCUTS.—*Park Record*, Aug. 11: Work is progressing favorably at the mouth of the Ontario three-mile tunnel. Nearly all the necessary buildings are about finished, and Camp Florence is a scene of much activity. Work at the Rochester has been stopped for the present. The Anchor drain tunnel is now in about 4400 feet and the stretch of loose, wet ground having been passed, the work progresses more satisfactorily. It is just a year since work began and two-thirds of it is finished. The ledge in the Ontario, which the drift from the 1200-foot level in No. 2 shaft was run to crosscut, is showing up in such a way as to exceed the expectations of those most sanguine. As depth is attained the Ontario ledge increases in width, and assays from the ore taken out show that the richness of the mine is still there.

ORE AND BULLION SHIPMENTS.—Last Sunday the Ontario shipped 38 bars of bullion containing 19,960.24 fine ounces of silver. During the week the Crescent shipped 216,000 pounds of concentrates. The Ontario, Daly, Sappin and Apex shipped ore this week, but the amounts were not obtainable. On Tuesday 8 bars of Daly bullion, 8102 fine ounces of silver, were shipped from the Marsac mill, and this morning the shipment was 7 bars, 6499 fine silver ounces.

WASHINGTON.

CHEWELAH.—*Stevens County Miner*, Aug. 9: The mining outlook is much brighter than for a long time past, in fact, the showing on the claims of the district was never better. A strike in the Copper Chief has stirred up an action among the miners that makes the camp present an extremely lively situation. The vein of ore in the Copper Chief is five feet in thickness and assays already made prove \$320 silver to the ton. The Eagle mine, too, is looking far better as the work progresses. The production of ore from the Eagle this week far exceeds the output of the mine for any previous week since the mine commenced working.

BOUNDARY CREEK.—The Rock creek and Kettle river region is proving fabulously wealthy not only in gold and silver, but in copper. About 25 miles east of Rock creek there is a section of country now attracting the attention of mining men, that is rich in copper. It is not a simple indication as is many times the case with copper prospects, but there are immense ledges 12 feet thick of ore that will assay from 30 to 50 per cent copper, and even more than that, together with sufficient silver to pay the expenses of treating. Mr. Al. McKinney, who has been prominently identified with the mines of that region, was in the city last week. He had just returned from the headwaters of the Kettle river where these copper ledges are situated and pronounced them as equal, in value and class of ore, to anything in the shape of a copper deposit he has ever seen. The principal copper deposits in the new district are included in the claims known as the King Solomon, Copper Queen and the Bluebird. The ledge is fully one mile in length and crops out boldly upon the surface the whole length of this distance,

THE LIXIVIATION OF SILVER ORES WITH HYPOSULPHITE SOLUTIONS

(With special reference to the Russell process),

BY C. A. STETEFELDT.

The only complete Treatise on the Chemistry and the Practice of the Lixiviation Process.

Published and sold by the Author, 18 Broadway, New York.

Price \$5.00, Registered Postage Prepaid.

Remittance should only be made by Bank Draft, or by P. O. Money Order, payable to the order of C. A. STETEFELDT.

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

TATUM & BOWEN,

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 270 Market St., S. F.

FOR WEEK ENDING AUG. 7, 1888.

- 387,337.—SAW-FILING AND SETTING MACHINE—Bearsley & Perry, Eureka, Cal.
 387,339.—PURIFYING HYPOSULPHITE SOLUTIONS—R. D. Clark, Cortez, Nev.
 387,492.—EXTRACTING GOLD AND SILVER—R. D. Clark, Cortez, Nev.
 387,283.—ORANGE PICKER—C. Ducommun, Los Angeles, Cal.
 387,347.—AMALGAMATOR—A. H. Eysaman, Dayton, Nev.
 387,350.—TWO-WHEELED VEHICLE—Peter Glaszner, Redding, Cal.
 387,229.—SCREW PROPELLER—Hall & Sloan, S. F.
 387,230.—HORSE-CHECKING DEVICE FOR HARVESTERS—D. C. Hall, Stockton, Cal.
 387,356.—ROLLER-BEARING—R. W. Hent, S. F.
 387,590.—CONSTRUCTING RAILWAYS—C. H. Horne, Tucson, A. T.
 387,522.—DRAG SAW—J. B. Lalonde, Portland, Ogn.
 387,313.—MEDICAL COMPOUND—B. B. Motea, San Joaquin county, Cal.
 387,320.—TWO-WHEELED VEHICLE—J. A. Sneed, Marysville, Cal.
 387,459.—WHEEL-FASTENING DEVICE FOR CAR AXLES—A. J. Spicer, Portland, Ogn.
 387,326.—HARNESS FOR KICKING COWS—A. Sweet, Ferndale, Cal.
 387,603.—TURNABLE FOR CABLE R. R.—Chas. Vogel, S. F.
 387,330.—SPEED REGULATOR—Geo. F. Wells, S. F.
 387,477.—LOGGING-CAR—M. Wilbur, Seattle, W. T.
 387,613.—TREATING NATIVE SODA—L. F. J. Wrinkle, Virginia City, Nev.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HARNESS FOR KICKING COWS.—Alonso Sweet, Ferndale, Humboldt Co. No. 387,326. Dated Aug. 7, 1888. This is of the class of devices for keeping cows from kicking when they are being milked, and it consists in a strap passing around the body of the cow over the flanks and loins, and having secured to it a block which is pressed into the flank just in front of the hipbone. The object of this invention is to keep the cow from kicking by placing an obstruction before the hipbone, so that its movement is completely arrested.

SAW FILING AND SETTING MACHINE.—Wm. H. Bearsley and Bsthune Perry, Eureka, Cal. No. 387,337. Dated Aug. 7, 1888. This invention relates to the class of machines for filing and setting saws, and consists in the arrangement, construction and combination of certain frames forming ways or guides, the novel sliding and adjustable anvil on one side of the frames for setting the saw-teeth, and details of construction. The object is to provide a simple and readily operating machine for filing and setting saws.

SPEED REGULATOR.—George E. Wells, S. F., assignor of one-half to Manly C. Lawton, Staten Island, Ctl. No. 387,330. Dated Aug. 7, 1888. This invention relates to the class of devices for regulating the speed of engines, and especially motors designed for running small machines; and it consists in a bellows like frame operated by the engine or motor and having a regulating valve, and a brake connection from said frame to a portion of the engine or motor. The object is to provide a simple speed-regulator, delicate and noiseless, but effective in its operation, and which is, therefore, specially adapted for use in connection with motors designed for operation in automatic musical instruments where the speed has to be varied and controlled with so much accuracy.

TWO WHEELED VEHICLE.—Peter Glaszner, Redding, No. 387,360. Dated Aug. 7, 1888. This invention relates to that class of two-wheeled vehicles commonly known as "carts," and consists in the novel spring connection between the axle and the body, whereby the latter is permitted the required independence of movement to avoid having imparted to it the usual unpleasant motion due to the joggling of the horse; in the brake mechanism and its arrangements, whereby on a down grade the weight on the back of the horse is relieved; an adjustable strap connection of the front of the body with the crossbar of the shafts, whereby on an up grade the weight is thrown on to the horse's back; in the adjustable connections between the axle and the shafts, whereby the latter are regulated, and in details of the construction, arrangements and combination.

TWO-WHEELED VEHICLE.—James A. Sneed, Marysville, No. 387,332. Dated Aug. 7, 1888. This invention relates to the class of two-wheeled vehicles commonly known as "carts," and consists essentially in a novel, limited and ad-

justable hinge or pivot connection by which the axle is let into the structure, whereby the body is allowed an independence of movement and the vibratory motion of shafts is not communicated to the axle. It further consists in the construction, arrangement and combination of the axle, body, shafts and main springs, pivot connections, limiting springs and adjustable devices. Regarding the general structure of a cart, as comprising three main elements, namely, the shafts, the wheeled axle and the body, it is apparent that the connections between them cannot at any point be an unlimited hinge or pivot, for if the shafts were connected with the axle after the manner of four-wheeled vehicles the axle would turn, and, carrying the body with it, would precipitate the occupant. The result would follow if the body were simply hinged on the axle. Consequently it will be found that in the old style of carts the connections are all rigid, so as to afford stability, but it is plain that while safety is thus obtained it is at the expense of comfort, for the joggling of the horse is transmitted through the shafts to oscillate the axle, which in turn vibrates the body and causes that unpleasant forward and back motion to the occupant which renders carts so unpopular. There is between these extremes a middle course, which unites stability with comfort, and this course involves three things, namely, the joining the body of the axle by a limited yielding connection, the connection of the shafts in a similar manner, and the employment in the same vehicle of both connections.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

NORTH SEA TRADING CO., Aug. 9. Object, building, buying and selling vessels, ships and steamers for whaling, fishing, hunting and trading business in the Arctic ocean and elsewhere. Directors—N. Bloom, Alfred J. Marcus, Wm. Baneman, Milton A. Eisner and George W. Frank. Capital stock, \$35,000.

EUREKA IMPROVEMENT CO., Aug. 9. Capital stock, \$150,000. Directors—C. E. Knapp, F. M. Butler, C. E. Wilson, G. W. Sessions and Wm. W. Broughton.

WAREHOUSE LAND AND IMPROVEMENT CO., Aug. 10. Capital stock, \$200,000. Directors—Clark W. Crocker, Chas. H. Crocker, Jno. D. Yost, W. A. Sammarton and T. S. Mathewson.

WELSBACH INCANDESCENT GASLIGHT CO. of Oakland, Aug. 14. Capital stock, \$1,000,000 in 100,000 shares. Directors—H. L. Cope, C. M. Jennings, Simpson Tatis, J. L. Stewart, F. K. Shattuck and J. H. Smith.

GREENHORN CANYON G. M. CO., Aug. 14. Capital stock, \$100,000. Directors—R. R. Swain, E. K. Swain, F. A. Swain, J. S. Goodwin, M. T. Lawrence.

STOCKTON, FRESNO & SOUTHERN R. R. CO., Aug. 2. Object, building and equipping a narrow-gauge railroad 175 miles long over the following route: Commencing at Stockton and extending southeasterly through San Joaquin, Stanislaus, Merced and Fresno counties and through Tulare county to Visalia; also a branch line to Fresno. Capital stock, \$3,500,000. Directors—Henry L. Davis, H. B. Hunt, Thos. R. Hayes, A. T. Murvey, Daniel E. Hayes, George H. Collins and L. M. Hickman.

Mining Share Market.

The stock market continues dull and inactive, a record which has now been kept up for a long time. Even on the Comstock affairs are dull, but the faith of the people there is not abated. Preparations for the prosecution of work in all the mines are as elaborate and thorough as they have been at any time for the last 10 years. The tendency of their researches and endeavor is to reduce ore cheaper, and ever cheaper. Every dollar per ton saved in the reduction of ore brings millions upon millions to be made at the business within the profitable range of reduction. The Virginia Chronicle says: Arrangements whereby enough more water-power may be obtained to operate 20 additional stamps in the Nevada mill, by the Pelton wheel, are under consideration pending the delay in the introduction of the electric motor-power. The grade of Hale and Norcross are so far crumbed the current month has averaged over \$48 per ton by pulp assay. With this grade, the hullion yield of the mine can be maintained at a dividend-paying basis, with the additional 20 stamps added to the present crushing-power.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Nevada Queen, Aug. 13, \$18,000; Mt. Diablo, 13, \$4638; "Work Your Own Diggings," 10, \$4000; Overman, 10, \$6200; Confidence, 11, \$17,870; Grand Prize, 14, \$17,933; Cons. Cal. and Virginia, 11, \$37,008; Hale and Norcross (for August), \$86,799.

The Fresno syndicate bought recently 9000 tons of Japanese copper out of a total estimated annual production of 10,500 tons, with the option to the syndicate of taking a similar quantity for a further period of two years.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

New York Metal Market.

Telegraphic advices dated Aug. 16th give the following New York prices:

BAR SILVER—02c per oz.	
BORAX—3c.	
COPPER—LARK—\$10.70	
Iron—No. 1, \$22.00	
LEAD—\$4.40c	
TIN—\$21.00c	

The following is the latest by mail from the "New York Metal Exchange Market Report":
 COPPER—Steady, spot closing at \$18.75@19.00. Transferable Notices (Lake) issued at \$16.50@17.00.
 LEAD—Firm, at \$4.30c—spot. Transferable Notices issued at \$4.00@4.15.
 TIN—Irregular at \$20.40@20.45.
 Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.
 Australian Tin, @—; Billiton Tin, @—; Banca Tin, @—; Baltimore Copper, \$14.75@15.00; Orford Copper, \$15.00@15.25; P. S. G. Copper, @—; Foreign Lead, \$8.60@8.75; Foreign Spelter, \$5.40@5.50; Antimony, \$9.75@13.50.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Sampling Works for Sale.

The works are situated on A. & P. R. R., Calico Mining District, Daguerre, Cal., and contain a first-class Engine and Boiler with Ore Crusher and other machinery, Platform Scales, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLESPIE & CHILDS, 123 California street, San Francisco.

THE University Regents have complied with Prof. Holden's request and provided funds for observing the total eclipse of the sun which occurs Jan. 1, 1889. It will not be total at Mt. Hamilton, but will be near Bertlett Springs, and observations will be made there.

The tin mines on Admiralty Island, 100 miles south of Douglas Island, Alaska, are said to have been sold to an English company for a very large price.

McINTOSH's sampling works, at Sandy, Utah, were destroyed by fire this week.

Sales at San Francisco Stock Exchange.

A NEW PAPER BINDER—A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, and very cheapest of all economical and practical file binders. Newspapers are quickly placed in it (as received) and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price (size of this paper, Harper's Weekly, and Scientific American), 75 cents; postage 10 cents. Postpaid to purchasers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

Our Agents,

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. LEWIS—Arizona Territory.
A. F. JEWETT—Tulare Co.
C. E. WILLIAMS—Yuba and Sutter Co's.
JOHN L. DOYLE—Oregon, Montana and Idaho.
E. B. GREENHORN—Humboldt Co.
W. W. THORNTON—Sonoma, Napa and Yolo Co's.
F. B. LOGAN—Lake Co. and Nevada State.
S. J. LITTLEFIELD—Santa Barbara, Los Angeles and San Diego Co's.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (containing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

The Solano Times says: The Mohican has been hauled alongside the yard, where her baling will be removed. There is some talk of taking out two of her six boilers to increase the ship's capacity for carrying coal, and also of shifting the smokestack, as it burns the rigging.

REMEMBER.—We can make it an object for some friend desiring first-class passage at a low rate to this East to consult us before buying tickets.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

Books on Working Ores.

By GUIDO KUSTEL, M. E.
ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.
This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, cloth, postage free. Sold by Dewey & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.
AARON'S LEADERS GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & CO., S. F.
BOUND VOLUMES.—Back files of this paper bound in substantial cloth binding with leather back, containing six months' numbers in each, indexed, can be had at this office at \$4 per volume.

WINANS' ANTI-INCORUSTATION POWDER Or Boiler Compound

For Removing or Preventing Scale, Corrosion and Pitting in Steam Boilers.
Send for References.

J. C. WINANS, 220 Fremont St., S. F., Cal.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE FRUE ORE CONCENTRATOR
OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,
Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

\$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

NATIONAL ROCK DRILL.
200 Sold on this Coast. Has less repairs than any other Drill.

PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

THE RAND DRILL COMPANY, 23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary

PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity, INSPEED OF DRILLING, perhaps it is in order to say that in EVERY AUTHORITATIVE CONTEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact, coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

SAN FRANCISCO, SATURDAY, AUGUST 25, 1888.

VOLUME LVI.
Number 8.

A Quadruple Compound Engine.

A practical working test was made last week of a quadruple expansion marine engine recently completed at the Fulton Iron Works, in this city. The engine was built for the coasting steam schooner Michigan. On the trial trip of the vessel, with 180 pounds pressure, the engine making 104 revolutions, 10½ knots were logged. The engine started off just the same as an ordinary one, with no difficulty and no "hitches" of any kind. The vessel is 162 feet long, 34 feet beam, and 12 feet depth of hold.

This is a new departure in steam engines. It is the first quadruple expansion engine ever built on this coast, and the second ever built in this country. The first one was tried on a steam launch in the East, but for regular trade work this one is practically the first.

The engraving on this page shows the new engine. The four cylinders are coupled in Z form. The steam enters the first cylinder at the right hand on top, and then goes to the left-hand upper one. It then passes into the lower right-hand one and thence to the left lower one. The cylinders are respectively 11, 14½, 20 and 32 inches; stroke 24 inch. The engine stands, complete, about 15½ feet high. There is one boiler 10 feet in diameter and 9 feet 6 inches long. It contains two corrugated furnaces 40 inches in diameter. It is the ordinary compound type of boiler. The shell is made of steel 1½ inch thick. This boiler is the same size employed with a smaller engine, nevertheless it keeps up steam with the greatest ease in this engine, while with the smaller compound engine the boiler had all it could do to supply the proper quantity of steam.

This is the most forward step ever taken in this country in marine engines. Tripling the compounding is now common, especially on large ocean-going steamers, but this is the first time the quadruple has been employed on a large vessel. The quadrupling was done in order to gain economy in the use of steam, and the result has proved highly satisfactory. It is now known that there is not much economy in trying to expand in one cylinder. The higher the pressure, the more cylinders are required to get the full benefit of the steam-power.

It was about 20 or 25 years ago when compound engines began to displace the single-cylinder type. Then about 10 years ago the triple cylinder was introduced and its use has gained rapidly. Now, within the past two years the quadruple has been introduced abroad.

Just as the compound took the place of the old-style marine engine that preceded it, so the triple expansion is rapidly supplanting the single compounds of 10 or 20 years ago. Advanced engineers and the makers of this engine believe that the quadruple expansion engine will, inside of a few years, replace the triple, as the triple did the single compound. In fact there may be five cylinder engines before long.

With steam of high pressure, up to a certain point, the more cylinders the more utility. The economy in the use of steam advances just as the pressure increases in a certain ratio. With four cylinders nearly all the power of the steam is utilized with direct results in economy. This engine was designed at the Fulton Iron Works, and is built on well-recognized principles. These works have for some years made a specialty of marine work, and have kept up with modern improvements. In this case they have made a marked advanced step.

A MARINE DISASTER.—On Wednesday morning the incoming China steamship Oceanic and the outgoing Eureka steamship City of Chester collided in a fog off Lime Point, at the entrance of San Francisco bay, and the latter vessel was sunk.

THE BIG BEND TUNNEL.—At the Big Bend tunnel, Butte county, they have had a great deal of trouble with their electric plant, and many changes had to be made, but there is nothing but what can be remedied. In time all

Mine Surveying.

The importance of thorough and accurate surveys of mines is not so generally realized as it should be. In our very large mines careful underground surveys are made and kept for constant reference, but there are many important mines that trust to a sort of rule-of-thumb for record of work. The most extensive and accurate mine surveys are those of the collieries of Pennsylvania and the metaliferous mines of the Hartz. It cannot be said, however, in this country or abroad that mine surveying has kept pace with the advances in other branches of surveying, for it is to be regretted that in many cases mine surveys are still made with instruments which have long since been set aside as too inaccurate for surveys above ground, although the latter rarely present such serious difficulties as are encountered under ground.

In Great Britain this is, in part, due to the conservatism of miners—a conservatism which has frequently led them to regard with contempt every kind of knowledge except that learned under ground. As a rule, the untrained mind treasures every truth as a mystery, to be carefully guarded for individual use only. Experience has often stored an individual mind with useful facts which are rarely recorded. The miner trusts to his memory, and when he dies the results of his experience die with him. These remarks apply particularly to Cornwall, where the mining proverb "Where it is, there it is," still holds its own.

Another cause which has retarded the progress of mine surveying is the uncertain and speculative nature of mining. Casual failures caused by the want of easily accessible information frequently lead to the abandonment of highly promising mines. Mining, though speculative, is by no means entirely the work of chance, and he who, avoiding vague and unsatisfactory speculation, constantly stores up facts, and can grasp the extent and object of mining works, is frequently enabled to avoid expenses and difficulties in which those who are without such data would soon be involved.

The branch of surveying especially applied to mining consists in measuring, with a view to subsequent delineation on a plan and sections, first the underground workings of a mine, and, secondly, the mine buildings at the surface, etc. Thirdly, it requires an accurate method of connecting underground and surface surveys. Trustworthy plans and sections are of value for giving a condensed view of all the facts connected with the works and explorations of a mine; for affording data to assist in the further prosecution of workings after temporary abandonment, and for the avoidance of litigation, trespass, loss caused by driving in the wrong direction, etc., which have too often resulted from incorrect or imperfect mine plans.

A short time since J. B. Lippincott & Co. of Philadelphia published an excellent treatise on "Mine Surveying," written by Bennett H. Brough, instructor in mine surveying at the Royal School of Mines, London. It is a very useful work for mining engineers and superintendents, containing about all that is necessary to be known on the subject. The book only costs \$2.50 and is well illustrated.

The contract for the erection of the Nevada Queen and Commonwealth mill at Tuscarora has been let to the Union Iron Works of San Francisco.

QUADRUPLE COMPOUND ENGINE BUILT BY THE FULTON IRON WORKS.

in 50 fathoms of water. Fifteen people were drowned, including some women and children. The question of the responsibility for the accident will be decided by the Government Inspectors. The City of Chester was valued at \$150,000, and her cargo was worth about \$5000. The Oceanic was but slightly injured.

It is said that the drill in an oil-well at Oil City, Southern California, has struck gold-bearing gravel at a depth of over 500 feet.

will run smoothly. The difficulty with the electric plant has retarded work this season.

At the annual meeting of the stockholders of the Independence Mining Co., the following officers were elected for the ensuing year: E. Scott, president; F. A. Berlin, vice-president; T. J. Shackelford, H. H. Pitober and J. W. Pew, trustees. J. W. Pew was re-elected secretary, W. C. Price superintendent and the Anglo-Californian bank treasurer.

The Achievements of Mechanics.

Skilled Labor in California and Its Results.
[An address delivered at the opening of the Mechanics' Institute Fair by Robt. S. Moore, superintendent of the Riedson Iron Works.]

It is now 33 years since this Mechanics' Institute was organized. It is but 38 years since this—the State of California—was admitted to the Federal Union. I think of what we, the mechanics of San Francisco, have achieved in this direction of lifting ourselves and our occupations to a higher level, with great satisfaction. I look abroad over the State in which we live, over the land in which our destinies have been cast; I reflect upon the conditions surrounding us, the wages we receive, the opportunities we enjoy, the education we have acquired, and that afforded for our children, the dress we are enabled to wear, the food we consume, the dwellings in which we live, the social circles in which we move, and thank God our lot is cast in so delightful and so prosperous a land.

I look over this most respectable audience owning its spacious hall, in which it makes yearly exhibits of the handicraft of its members; over the faces of the mechanics' children sparkling with bright intelligence; I reflect that all adult mechanics are units of a great and splendid Government, each workman the equal and the peer of every other man in the Republic, and I am rapt in the presence of the Divine Author of all these most generous and snubbing gifts, and I thank Him that our lot has been cast in an age so advanced and a country so supremely blessed.

When I consider all these things I say to myself—and I have the right to remind you—that these gifts and opportunities are attended with responsibilities and duties from which we have no right to attempt to escape or endeavor to avoid. The first and greatest of these must ever be the necessity of loyalty to the Government and obedience to the law. Loyalty to the Government because it is ours; because under it all men are free, all are equal, all born upon the soil and legally naturalized are clothed with the electoral privilege; all are sovereign; the Government was created by labor, carved by toil from primal wilderness and virgin prairies; toilers, and the sons of toilers, fought the war in which its independence was achieved, built the national structure, developed in legislative halls its splendid constitutional fabric, fought its conflict for the emancipation of slaves and for the preservation of the American Union, and stand to-day the guardian of its freedom and the bulwark of its priceless liberties.

We must obey the laws because we make them. The majority of the American people are laborers—laborers with brain and muscle; more with muscle than brains, more at the plow and work-bench, and toiling with their hands, than in all other occupations beside. The majority rules the republic under laws made by it. We are the majority, and if we do not respect and obey the laws, who shall? If capital infringes the law, we have the right to correct it. If labor, ignorant, misguided and criminal, attempts to overturn the laws, we, the majority within the ranks of labor, must discipline and control it.

The first guiding principle, the cardinal underlying rule of every labor organization, the first thought of every mechanic's mind, ought to be unquestioned obedience to the law. If the laws are wrong, tyrannical or oppressive, it is our fault, for we, if we have not neglected our duties and our opportunities, have made them. If they are imperfectly or corruptly, or in any way badly executed, we are to blame, for we have elected, or had the opportunity to elect, the officials who execute them. There is no safe way of amending or repairing bad laws except by legal modes; riots are never excusable; anarchy is a crime; communism is indefensible. Under the structure of our organization, where all are equal, all sovereign, and the majority makes the law and executes it, it follows as an inextinguishable, logical conclusion that if laws are bad and badly administered, it is the fault of the majority which makes and executes them, and of that majority the intelligent, skilled mechanics and workmen of the nation are the most responsible.

The cry against capital is not half a truth because the great bulk of the nation's vast wealth is owned and enjoyed by the working forces which created it. Wealth is the slave of labor. Gold is of no value while piled in vaults unused; it is worthless. It cannot be moved, or used, or enjoyed, except at the will of labor, and when it moves it earns more for the man who handles it than for the man who owns it. Labor is the master, capital the indispensable, if not the always willing slave. It has some advantages—it may sulk, it may run away, it may refuse to be used; it may hide itself in vaults of steel which we have been paid to make fire and burglar proof. Hence it is policy that we should make for its protection, just laws, treat it kindly and generously, as all masters should treat their most valuable servants.

Again, proud as we all are of labor, dignified and honorable as we concede it to be, let none of us be so dishonest and hypocritical as not to admit that we would prefer to be millionaires rather than working mechanics. Some time since a weekly journal of San Francisco published the names of 107 millionaires resident in this city, not one of whom was not a poor and toiling boy, not one of whom was the graduate of a learned university. All had come from the farm, the workshop, and the humbler walks of working life. Wealth, like the higher prizes of life, is open to the well-directed efforts of our

boys in this splendid empire of opportunity, and in this age most blessed.

This is not a fitting occasion for the introduction of political questions of a partisan character, for there must be times and places where these matters of consideration are of higher and broader importance than what we regard as mere partisan questions; but there is no time and no place where mechanics and skilled laborers can meet when it is not appropriate for them to deliberate on what concerns themselves, their families and their future. What promotes and aids labor aids them. What pertains to the rights of labor concerns them. That which dignifies labor gives them dignity. Political power and authority give to them weapons for aggression and an armor for defense. These weapons and this armor should never be used except in the right, seldom, if ever, except in self-defense under the law. When oppressions become unendurable, and wrongs irremediable, by any legal course of action, then comes the right of revolution and rebellion against the unjust exercise of arbitrary power. This we will not now consider.

How to protect ourselves and how best to promote our own interests without invading the rightful privileges of others, or trespassing upon rights guaranteed to others by law, should be matters which we should most carefully consider. This land of America is ours, and it must be preserved for us and as the inheritance of our children. Those who are born upon its soil, those who have become citizens by legal adoption, those who are on their way to citizenship through the courts, are equally entitled to all the rights and privileges incident to American citizenship. There can be organized no political party in which all should not have the privilege of membership, voice and equal participation. There should be no question in the consideration of which the workingman's intelligence should not be consulted, his selfish and disinterested advice listened to, and his wise admonitions heeded, but there should be no political question which Americans should not openly discuss.

The question of tariff for the collection of revenue for the support of Government, and incidentally for the protection of American industries, the question of foreign immigration, and to what extent it may be regulated and limited—the discriminations which may be made for or against different nationalities and different classes—are properly within the lines of political consideration, and there can be no doubt, I think, that the Government of the country has the unquestioned right to determine to what extent foreign immigration may be limited and what undesirable nationalities or classes may be entirely excluded from the privilege of residence upon American soil. There can be no doubt of the authority of the Government of the United States to determine whether it will further extend the privilege of the elective franchise and whether it will clothe any more men of foreign birth with the sovereignty of citizenship; whether it will not deem it prudent to preserve all that remains of its public domain as the heritage of its increasing native-born millions; whether the principles which govern the educational system, so generously charged with free instruction at the expense of the State, of the sons and daughters of the working families of the nation, should in any respect be changed, and whether there should be encouraged or permitted the establishment of any religious denominational or church power or ecclesiastical system, Protestant or Catholic, Church of Rome, Church of Jerusalem, Church of England or Church of America, drawing funds from municipal, State or National treasuries within the jurisdiction of a republic, whose organic and fundamental law declares that in this commonwealth there shall be no connection between Church and State.

We look upon England as a country of wise legislation in this respect, and its Church has, by an English Parliament, within the generation, been disestablished in Scotland and Ireland, while the extension of the principle to Wales and England is now a matter of grave consideration. All these questions come properly within the scope of consideration by intelligent mechanics, because we, in common with all citizens, are charged with the responsibility of ultimate decision.

When all these matters are contemplated, and the condition of the American mechanic deliberately considered, if any one in the United States of America shall ask, is labor honorable and dignified? let the answer be: The Creator of the Universe was an architect and builder; His only Son a carpenter; the first created man, a gardener and fruit-grower; the apostles, fishermen, the patriarchs, herdsmen; the first navigators, those legendary argonauts searching for the golden fleece; the early explorers pushing beyond the pillars of Hercules till they discovered America, circumnavigated the globe, found the entrance of the Golden Gate to our golden shores, and exposed India to the commerce of the world, were sailors. Peter of the great Dynasty of the Romans who laid the foundation of a colossal northern Empire, was a shipbuilder; William, the conqueror of England, married a tanner's daughter; Franklin was a printer; Washington a surveyor; the immortal Lincoln, who preserved the nation that is ours, was a rail-splitter; and Grant, the hero, who fought the battles that preserved the integrity of our nation, was the son of a tanner and himself a toiler.

The skilled mechanics and artisans, to whom and for whom I this day speak, do not suffer

by comparison with any composing the human family in intelligence, morals, patriotism; they compare favorably with the best, harvest and most useful of mankind. May we not in our pride say they are the very foundation of Christian civilization? May we not claim, and justly, that without the aid of the practical working mechanic the refinements of Europe would still be left with art, science and literature undeveloped; that except for the skilled artisans America would remain to-day an undeveloped land, peopled with red men clothed in skins, living in caves and running wild in the primal forests where they were born, and from which they would have no hope of deliverance.

While we consider the progress of the age and the nation we may not be unmindful of the fact that the inventors, mechanics and business men of California have not been deficient in their contributions of useful gifts tending to promote the welfare and add to the material comfort and intellectual advancement of the age. Our State of California, lying on the outer border of our National domain, has been linked with steel to our Eastern homes, and now the iron horse, feeding upon coal, and breathing fire, carries us dashing over mountains and across plains, leaping broad streams and deep ravines, till space is almost annihilated. California enterprise, and the daring of its pioneers, have achieved the engineering marvel of the century by crossing the continent by rail.

The skill and ingenuity of a San Francisco mechanic has given us the invention of wire cable, and its applications to street transportation, till, for the purpose of residences and business, our hills are level with the valleys, and our suburban homes so closely and so cheaply connected with our shops and places of business, that none but the men of means and leisure can afford the luxury of walking to and from their daily occupations. The street-car and dummy is the poor man's carriage, cheaper and more safe, more comfortable and more expeditious than the rich man's coach.

San Francisco will, within a few days, send an iron-clad Leviathan to the great deep, flying the American flag at her mast-head, evidencing the skill of her mechanics and the resources of the Pacific States. The "Charleston" with her frowning batteries of defense (never to be used, we hope, in aggressive, unjust wars), will, so long as she floats, evidence the fact that our inter-oceanic empire is defensible by the mechanical skill and patriotic courage of its sons of either shore. From Mt. Hamilton, through cloudless heavens that arch its summit, scholarly mathematicians are studying the courses of the stars as they move through the firmament of boundless space, and solving the sublime mysteries of the universe through a telescope more powerful and more perfect than elsewhere exists, the contribution of a California mechanic to the science and learning of the world.

Almost at the foot of Mount Hamilton, there grows a great university of learning, now and hereafter to be more richly endowed than any college resting upon imperial or royal benefices. A university where mechanical instruction will be provided for boys and girls, and from which the sons and daughters of no respectable person will be excluded, thus acknowledging the equal rights of all who are gleaners in the great field of human knowledge, of all who are workers and toilers in their endeavor to penetrate the mysteries of the boundless universe of human research.

Let us then be justly proud of our calling and our Order, proud of our rank among the useful classes. Let us bravely assert our power under the law and within the law and according to law, to preserve ourselves, our country and our children from the encroachments of foreign invasion, from ignorance, superstition, idleness, drunkenness and crime, and from the slavery from which any tyranny, ecclesiastical, civil or political, would endeavor to bind us. Let us fear and avoid the tyranny of ignorance, by sending our children to kindergarten schools, where they may play at acquiring the rudiments of education, then to the public schools, where they may be equipped in their intellectual armor of mental and moral defense. Let us demand for them proper legislation and apprenticeship, and let us so teach them in religious and political principles at our own homes and by our own firesides, that we may send them forth fully panopied for their own defense in the struggle of life, and fully equipped to fight successfully the battles in which Americans must of necessity be involved. Let us for ourselves and for our children recognize the necessity of free conscience, free thought, free expression, free speech, and a free ballot-box for the maintenance of our free republic, the protection of our properties and the preservation of our personal liberties. Let us be proud of our American citizenship and be ever prepared to offer our lives, our fortunes, and our honors in its defense and in defense of the American flag.

THE Oroville Register says: Mining prospects in this vicinity are excellent, and a large amount of money will be invested in the mines of Butte before the end of the year.

VERY little of the copper produced at the smelting works of the Rio Tinto, Tharsis and Cape companies during the past six months has been sold.

A. CAVAGNARO was killed by a blast in the Ute mine, Angels, Calaveras county, last week.

THE French syndicate is estimated to have on hand about 85,000 tons of copper.

The Charleston.

How the Cruiser Happened to be Built in San Francisco.

It happened in a committee-room the other day, when I was in conversation with some of my friends who are present at this moment, that a subject was suggested. It was in reference to the steel-producing capacity of the State of California. I happened to be on that coast, a member of the Committee on War Ships and Ordnance, and having an opportunity to make some investigation, I did so. I came in contact with steel producers and manufacturers and with the builders of steel ships, colliers and other ships that run up and down the coast of the Pacific. They were building them at San Francisco. I went down and examined the works that they had. In the works there was found every modern improvement.

There was a very enlightened man, who was raised at a lathe or in a machine-shop in Baltimore, and who had gone over to the Pacific Coast. The gentlemen who were the stockholders in that enterprise had sent him abroad through this world for the purpose of ascertaining the condition of the machinery which was employed in the construction of great ships and great guns in every nation of the earth. Being very active and a very enlightened man, he gained all the information that was necessary. He came back, and they sold out their old plant, moved a little farther up the bay and built an establishment there which utterly astonished me, both for its capacity and for the splendor of its arrangement. He was then about to launch a caisson, which he was building for the dock at Mars Island navy-yard, a very beautiful and splendid structure of California steel.

In conversation with him about his capacity for building on the coast, I said to him: "Why do you not attempt to build some of the iron ships on this side of the continent?" "Why," he said, "we have had no opportunity to do it. If you make your provision of law and authorize the Secretary of the Navy to make contracts, we will inform him of our capacity, and doubtless we can get contracts for building ships." So when a naval-appropriation bill came up I ventured to offer an amendment to it, which was passed and adopted by both Houses, requiring that the Secretary of the Navy, in his offer for hullings for ships, should offer to have at least one of them built at San Francisco. The result was that the contract was taken, and I believe a second one is now being constructed there. Within a few days past the Charleston has been launched from the ways in the bay of San Francisco, and that is the first steel or iron ship for the navy that has ever been built on the Pacific Coast.

Mr. President, that all resulted from the fact that there was a man of enterprise there and there were gentlemen of capital to back him. They had confidence in him, and he had confidence in his ability to build a ship. We have now started that enterprise on the Pacific Coast, and after this time the Pacific Coast will yield her quota of vessels to the American navy just as rapidly as we desire that they shall be produced.—Senator Morgan in Congressional Record.

THE LICK INDUSTRIAL SCHOOL.—All of the Lick trustees, with the exception of E. B. Mastick, are absent from the city. Charles M. Plum, who is in New York, has written to Secretary Matthews stating that he will return within a few weeks. Captain R. S. Floyd, who has been in the country for the benefit of his health, has also written, stating that he is improving rapidly and will be able to return in a short time. Judge John M. Boat, secretary of the trustees for the School of Mechanic Arts, is also absent. Upon the return of all these gentlemen the first important step will probably be taken to make arrangements for establishing the School of Mechanic Arts, for the founding of which the sum of \$540,000 was bequeathed in the will of the late James Lick. This project has long been delayed on account of several obstacles that have intervened, such as selecting a suitable place for the school and the best manner of making the appropriation. The trustees for establishing the school have at last become impatient, and it is probable that a permanent understanding with the trustees of the funds will shortly be reached. After the work is commenced it will probably be a year before it is entirely completed.

WHAT THE MINER PRODUCES.—The farmer toils in his field from sunrise till sundown, warring against every kind of pest and natural enemy until he harvests his crop. He then takes them to market and receives what the sharpest, who buy his commodities, may see fit to give him. The fruit-grower may get good prices for his productions till there is an over-production, then down they go. The only producer who can tell in advance what his product will bring in the market is the gold miner. He knows that every ounce he digs from the soil will be worth dollar for dollar. His risks in finding deposits are great, but not more so, perhaps, than are the risks in other occupations. The farmer has adverse winds, drouths, natural pests, etc., to contend with, which make his business hazardous, as much so, probably, as the miner's. The honest miner who has a good claim has no competition. Every one wishes him well. What he produces is so much wealth added to the world. It is practically indestructible. He can let the balance of the world whistle, while he smokes his pipe in peace. Happy, honest miner.—Nevada Herald.

THE amount of bullion tax collected this year in Nevada is \$35,000.

Passing Events.

A terrible disaster occurred at the entrance of San Francisco bay on Wednesday, when a number of people lost their lives by a steamship collision and the sinking of one of the vessels. The accident was due to a fog in the channel and a probable misunderstanding of the fog signals.

On another page is given a description of the first quadruple expansion marine engine ever built here. This marks a very important step in the progress of marine engineering. The trial of the engine amply proved the claims of the designers in the direction of economy in the use of steam.

Both Washington Territory and Oregon are making rapid advances in the mining industry. With more reduction works, which are now being furnished, old districts will be brought to the front and new ones rapidly developed. The mineral resources of Washington particularly have long been neglected.

The winter season in California and Nevada has been short this year, and lack of water has retarded mining operations in many places.

It is reported that S. Wenhan, owner of the Cortez mine, near Beowawe, Nev., has gone to England with the view of disposing of the mine to English capitalists.

The last dividend of the Calumet and Hecla Copper Mining Co. of Michigan—\$500,000—made an aggregate of dividends of the company of \$30,350,000.

Why Mining has not Quite Kept Up.

Vast as have been the improvements made of late years in the business of mining for the precious metals, these improvements have been by no means so signal as those that have meantime characterized most other lines of human endeavor. In the art of printing and engraving, in the construction of ordnance and firearms, in the manufacture of agricultural and mechanical implements and machinery, in locomotion and transportation, both by sea and land, and in a great many other arts, industries and pursuits, more advancement has been made during the last half century than in any branch of mining. We speak now of arts and industries that had an existence 50 years ago, and not of those original inventions of more recent times, such as the photograph, telegraph, telephone, electric motor, etc., which, besides being new in themselves, are marked by other features of special significance.

Recalling the most noteworthy mining improvements of modern date, we find among them none that has brought to the business such gains as have inured to the grain-grower through the introduction of the combined reaper, thrasher and winnower; nor yet any that economize labor as do scores of machines now employed in the various branches of manufacturing, the nearest approach to these in the department of mining consisting in the employment of water under pressure for auriferous gravel washing. Ore crushing continues to be performed for the most part with stamps, greatly improved, it is true, yet not essentially different from those in use a hundred years ago.

If, in most other branches of the business, greater progress has been made, there is still everywhere room for improvement; there obtains a general feeling that there is in our mechanisms and methods much that is insufficient if not defective. It is felt that we ought to save the precious metals more closely than we are doing; that general expenses ought to be reduced, and that more system and certainty ought to pervade the industry all through. While it is not easy to emphasize the weak points of the system, we are conscious they exist—conscious that mining for gold and silver suffers in these particulars by comparison with most other leading pursuits; and this we say not forgetting what has been achieved since gold was discovered in California. It may after all be the case, not that mining has advanced so little as that other industries, stimulated by a competition absent in mining, have during these later years shot ahead at an unwonted, some of them at an almost unnatural, rate. If these industries have in some respects outstripped mining, it has been because of this deadly rivalry which left them no alternative but that of keeping even with their competitors or retiring from the contest. For this sort of effort there has existed no imperative necessity in the business of mining for the precious metals. It has not been obliged to strain its energies in order to live.

Nevertheless, the time has come when this, like the other great industries of the age, may be expected to distinguish itself in the way of original invention and discovery; and that it is about to make a great forward movement there is every reason to believe. Aside from other special causes working to that end, the employment of electricity, both as a motor and an amalgamator or a promoter of amalgamation, promises to secure great advantages to mining. Encouraged by what this new agency has already effected, we await further results with large expectations, satisfied that it will bring to the business gains of the first importance.

It may be expected, too, that from the many different styles of pulverizers now contesting for supremacy there will have evolved in the ore-crushing service something better than anything at present in use. Such improvement in the manufacture of high explosives may also be hoped for as will diminish their cost while it adds to their efficacy and safety. And so of many other departments of the business, mining presenting to inventive talent a most inviting field. To the ingenious and skillful it offers such rewards as must cause them to put forth their best efforts, inasmuch as these rewards appeal to both the cupidity and the ambition of all so especially endowed. Our conviction is that some of the most useful discoveries of the proximate future will occur in the domain of gold and silver mining.

Unpatented Formulas and Trade Secrets.

It is a common impression that no invention is protected unless patented. This is true of any invention which is open and exposed. It is then given to the public, if not patented. But there is a class of inventions which is endeavored to be kept secret, because a patent would expose them to use, and detection is difficult. Formulae processes and trade secrets are of this class, and manufacturers find their safety in perfect secrecy. Yet they have to be intrusted to their workmen, and rival manufacturers endeavor often to profit, by seeking to employ such workmen educated in their rival's secrets, and think, perhaps, they have both a legal and moral right to do this, if they can. This is an error, as has been proven by many decisions based on common law. Such inventions and trade secrets are property, and when studiously kept, or endeavored to be kept, secret, cannot be legally appropriated by anybody.

A case in point was passed upon in the Supreme Court of New Jersey in 1886. The statement was given as follows: "Chancellor Reagan decided a case which is of unusual interest on account of the peculiar relief sought from the court. The court is asked to restrain a man from divulging a secret. The complainant claims to have discovered valuable secrets in connection with the manufacture of Cordovan leather, and for coloring kangaroo, alligator and snake skins. He had been engaged in the business about eight years, and employed his bookkeeper and superintendent with the understanding that they were not to divulge the secrets of the business. These men having learned his methods made arrangements with two strangers to go into business and compete with the complainant, their late employer.

"That the facts set up in the bill entitle the complainant to relief admits of no doubt," says the court. "A discoverer of a secret process of manufacture, whether patentable or not, has property therein. If the injunction be dissolved, the secrets would become known and an irreparable injury be done to the complainants." The defendants were restrained from using the secret process of which the complainant was the discoverer.

Manufactories at Seattle, W. T.

Our correspondent has recently visited the city of Seattle, W. T. There is much manufacturing now done in that growing place. The Washington Iron Works are as extensive as anything to be found in Oregon or Washington Territory. About 150 workmen are constantly employed, and the works cover an area of half a block. Engines, boilers, mills, mining and marine machinery are constructed, besides iron work for bridges, etc. Two iron bridges for Spokane Falls are now being made. Nearly all of the work turned out is for Washington Territory. J. M. Frink is superintendent of the works.

Moran Bros. employ about 35 men, and make a specialty of marine work. The supply of iron comes partly from the mines of the Territory, probably one-half, and the balance is imported from San Francisco and abroad.

Allmond & Phillips employ about 50 men. Considerable work is done at the foundry for Alaska and British Columbia. Eastern Washington Territory and the Puget Sound country keep the establishment busy.

F. Marco keeps 14 men busily employed in manufacturing wagons and carriages. He turns out over \$2500 worth of work per month.

Besides the above, and other factories where iron work is done, there are many lumber-mills. The Hall, Paulson Furniture Co. employ 25 to 30 men. The Stetson & Post Mill Co. (C. F. Reitze, foreman), employ 50 men in their saw-mill, where 65 M. feet of lumber per day are sawed, and 45 men in the factory, where building materials are turned out. The Seattle Lumber and Commercial Co. employ 75 men in mill and factory, saw 50 M. feet of lumber per day, which is largely worked up into building material for the local market. The Mechanics' Mill employs 35 to 40 men in mill and factory. The Oregon Improvement Co. employs 40 men, and saws 54,000 feet of lumber per day. The Excelsior Works, recently established, are a great success, and find a ready market for their product. They employ about 20 workmen.

There are other smaller establishments. The

above indicate that the city-front of Seattle, where all of these establishments are located, is a busy locality. One noticeable feature with regard to one and all of these works is that they are crowded to fill their orders, and many are working overtime to accomplish the task. With the present progress and prosperity of Washington Territory continued, there is no more favorable point on the coast for manufacturing enterprises than on Puget Sound.

Washington Territory Mines.

Our correspondent at Tacoma sends us notes of a new mining district lately opened in the northern part of Washington Territory. The region in question is known as the Conconully mining district. It is located along and adjacent to the Conconully creek, which is a small tributary rising near the boundary of British Columbia, and following southward to its junction with another stream which flows into the Columbia. The new district is reached by rail from Tacoma to Ellensburg on the Northern Pacific railroad, thence by stage 32 miles across the country to a point on the Columbia river, then by boat 120 miles up the Columbia to the Conconully, and from there by a wagon-road up that stream some 30 miles to the mines. Our correspondent's informant with regard to these mines was Thos. L. Nixon, a reliable gentleman of Tacoma, who has mining interests in the Conconully district, and who has just received his first carload of ore from one of his mines—the Launa. The ores of this district are mainly silver bearing, and assay in some instances as high as \$1000 per ton. Most of the ores, however, are of much lower grade, ranging in value from \$30 to \$50 per ton.

Little development work has as yet been done on any of the claims, the ore being taken from the surface. The ledges are of good thickness, so that the mining is done with extreme cheapness. The ore being of a class requiring concentration, parties have recently erected a concentrator in the district, so that the miner may get his product into valuable shape before shipping to smelters at San Francisco or elsewhere. These mines are attracting a great deal of attention in Washington Territory, and they promise excellent results for all labor expended upon them. The Tacoma, Ellensburg & Conconully Rwy and Navigation Co. is the name of a corporation which is taking in hand the forwarding of passengers and supplies for the new country, and they have already sent a great deal of mining machinery and merchandise to this camp. We hope to hear good reports from the Conconully district as the work of development progresses.

A BAR of gold bullion valued at \$19,000 was the result of a recent crushing of 165 tons of ore from the Lapanta mine, Hawthorne district. This shows a yield of \$66 a ton instead of \$1000, as was heretofore claimed to be the value per ton of that ore. Still, \$66 rock is pretty good.

ABOUT 300 negro miners have been brought from Illinois by the Northern Pacific Coal Co. to work their new mine above Koslyn, Washington Territory. There is considerable feeling about the "importation" among the white miners whom the negroes are to displace.

N. A. HARRIS, resident agent of the Big Bend Tunnel & Mining Co., has resigned his position and gone to commence operations on a contract he has to flume and grade 3200 feet of river about two miles above Oroville.

The Cherokee gold mine, Butte county, recently cleaned up \$32,000 from the "head flumes." They only expected \$16,000 or \$17,000.

MONTANA mines have paid in dividends so far this year \$1,926,000. Of this, Granite Mountain has paid \$1,200,000.

LARGE numbers of people now visit the Lick Observatory. There were over 200 there on Saturday night last.

DR. J. H. RAE, superintendent of the Carson River Dredging Company, left here on Wednesday for Dayton, Nev.

PIPE for the Tuscarora water-works is being shipped. There will be 66,000 feet in all.

AN immense rich pocket has been discovered in the Concepcion mine, Mexico.

The Russell Leaching Plant.

The working drawings here given of the plant for the Russell leaching process comprise the best features of five leaching plants, built especially for the process, and of the Sombreret plant now being constructed. With the exception of two minor details on the precipitating tanks, there is nothing given but what has stood the test of actual practical experience. The plant is entirely independent and complete as it stands, and may be situated wherever convenient, without reference to the position of the crushing plant for raw ores or for the crushing chloridizing plant for roasting ores, except as

regards the easy transportation of the raw or roasted ore between the two plants. Consequently when either one of the two above-mentioned plants for the preparation of the ore already exists in connection with amalgamation, the change to the Russell process can be made by the erection of the plant herein described without stopping or removing the amalgamation plant. The plant has its own boiler, and no engine is required.

The following is an index to the parts of the plant, as shown in the plate:

A. Leaching tanks; B. Solution-precipitating tank; C. Wash-water; D. Solution pump; E. Storage-tank for sulphides; F. Filter press pump; G. Storage tanks for solution; H. Storage tank for hot solution, or for preparation of extra; I. Cast-iron tank for preparation of so-

dium sulphide; J. Sheet-iron tanks for storing sodium sulphide; K. Iron pressure-tank; L. Filter press for sulphides; M. Steam-drier for sulphides; N. Boiler; O. Fire pump for sluicing; P. Solution pump; Q. Main ore track to leaching-tanks; R. Side tracks to leaching-tanks; S. Side tracks in chemical-room; T. Grade line between boiler and steam-drier; U. Grade line through sulphide storage-tank.
a. Tailing chute (to cars); b. Sluice gate for tailings; c. Sluice trough for tailings; d. Box for chemicals for extra solution; e. Ore car; f. Ore-car truck; g. Chemical car; h. Special extra trough over leaching-tanks; i. Solution trough over leaching-tanks; j. Solution trough to solution precipitating-tanks; k. Wash-water trough; l. Trough to conduct sulphides to sulphide storage-tank; m. Trough to conduct solution to solution pump sump; n. Waste wash-water trough; o. Solution pipe to leaching-tanks; p. Hot-solution extra-solution pipe to leaching-tanks; q. Water pipe to leaching-tanks; r. Hose for circulating extra; s. Hose from leaching-tank to siphon pump; t. Hose from leaching-tank to triple launder; u. Hose from siphon pump to triple launder; v. Siphon pump; x. Tailing car; y. Hose connections for sluicing; z. Waste-water pipe from triple launder.

a'. Pipes from triple launder to solution precipitating-tanks; b'. Pipes from triple launder to wash-water precipitating-tanks; c'. Valve or "gate" for sulphides; d'. Surface discharge for precipitating-tanks; e'. Sodium sulphide pipe; f'. Pipe for precipitated wash-water; g'. Connection between solution pump and sump; h'. Box and strainer around outlet; i'. Drip pipe from solution pump; j'. Pipe from pump to storage-tanks; k'. Connection between sulphide storage-tank and pressure-tank; l'. Connection between pressure-tank and press; m'. Siphon pump in filter press sump; n'. Solution pipe to sodium sulphide storage-tanks; o'. Pipe for drawing off sediment from pump sump; p'. Pipe for returning solution to solution pump; q'. Small windlass for steam drier; r'. Boxes over storage-tanks to prevent agitation of the solution; s'. Boxes and strainers around outlets; t'. Lead heating coils in storage-tanks; u'. Drip from lead coils; v'. Triple connection between the three storage-tanks; w'. Main steam pipe; x'. Water pipe from fire pump for sluicing; y'. Storage room for caustic soda and sulphur; z'. Trapdoor to filter press pump; a'. Gauge valve on side of pressure tank; b'. Pipe for drawing off sediment from solution storage-tanks; c'. Siphon pump for circulating solution through chemical-box in extra solution-tank.

WORKS FOR THE RUSSELL PROCESS.

Fig. 4. PLAN.

MECHANICAL PROGRESS.

The Development of Electricity in the United States.

There are now about \$6,000,000 invested in the manufacture of electric motors in the United States, and this large investment has nearly all been made within the last three or four years, says the *New York Sun*. It represents either the independent investment of companies engaged in the exclusive manufacture of motors, or an increase in the capitalization of companies that manufacture electric-light appliances, and find the construction of electric motors a good auxiliary industry. Some of these companies employ many hundred men, sometimes approaching a thousand, and they turn out motors almost innumerable each year. These motors are of all sizes, from one-half horse-power, for driving sewing machines and such other light work, up to several hundred horse-power for heavy work. They are becoming a driving force in almost every industry, and can be utilized in localities where the cost of obtaining fuel would almost equal their operating expenses.

The chief secret of the rapid advance of this new mechanical agent is found in the flexibility of its resources. Electricity is not the generator of power, but only this agency for its transmission and distribution, as it is an agent for the transmission of the human voice over the telephone wire. Through its resources power can be distributed to any point and in quantities to suit the customer. Steam, water, air, caloric, or any known agency for generating power, is either stationary or it demands stationary appliances; but electricity is its messenger boy, its Puck, who will consent to do its errands invisibly, and never ask a day off or the grant of liberty.

Does a lady want an infinitesimal bit of electrical energy to relieve her hoot on the treadle of her sewing machine? It can be delivered in her room through an iron box not much bigger than her reticule. Is the restaurant keeper plagued by an invasion of flies that expel all but the most hungry and least profitable customers? They can be gently wafted to the door by a multitude of revolving fans and conged out either into this bright sunlight or the refreshing shower. Everywhere, anywhere, without a particle of dust, offensive odor or disagreeable noise, the electric motor can be set to work, and, while it will bring the substances of the thing wanted, it will leave behind everything that can give offense.

The electric motor has passed its experimental stages, and this day seems to be rapidly approaching when every house will find something for it to do in lifting burdens from floor to floor, and performing every possible labor that can be done by machinery. Manufacturers have not yet begun to construct motors ornamented with gold-leaf, mother-of-pearl and precious stones to rock cradles in the nurseries, but these requirements will come in time.

Razors and Their Manufacture.

The manufacture of razors in the United States is comparatively recent, writes Thomas J. Bowditch in the *Troy Times*, but already it bids fair to equal at least that which has been carried on at Sheffield, England, for centuries. The utmost care is taken to obtain fine steel, but cutlers sometimes find the result uncertain. The small actual cost of manufacturing razors may be inferred from the fact that a razor is supplied to every soldier and sailor in the British army and navy at nine cents each.

The division of labor is much used in producing a razor, the blade having to go through at least 20 operations. The list of the principal of these is as follows: The blade is molded; forged; ground to take off the black scales; drilled for the rivet and stamped with the maker's name; hardened and tempered; ground; the shoulders are ground on a dry stone; the blade is ground on a leaden wheel, which gives the true curve to the surface; the tang and back are glazed by a leathern glazer; polished on a buff wheel with crocus; handled; set. In tempering razor blades they are heated in a coke or charcoal fire, and dipped into the water obliquely. They are then laid on their backs in a clear fire, six or eight together, and they are removed when the edges, which are yet thick, come down to a pale-straw color.

The edge of a razor consists of a great number of minute points, commonly called teeth, which, if the razor is in itself good and in good condition, follow each other through its whole extent with great order and clearness, and constitute by their unbroken regularity its exclusive keenness. The edge acts on the beard not so much by the direct application of weight or force as being drawn, even slightly, along it; because by this operation the fine teeth of which it consists pass in quick succession in the same part of the substance. The best razors will have the teeth of their edges set almost as regularly as a good saw, and the best test in trying a razor is to examine the edge by means of a strong magnifying glass. This almost explains the good effect on the razor caused by dipping it in hot water, which necessarily clears the edge of any small clogging substances.

Barbers often assert that razors get tired of shaving, and that they will perform satisfactorily if permitted to rest for a time. It will be found by microscopic examination that the tired razor

from long stropping by the same hand and in the same direction has the ultimate fibers of its surface or edge all arranged in one direction, like the edge of a piece of cut velvet; but after a month's rest these fibers rearrange themselves, heterogeneously, crossing each other and presenting a saw-like edge (as described above), each fiber supporting its fellow, and hence cutting the beard instead of being forced down flat without cutting, as when laid by.

Among the distinguished persons connected with the craft was Asishius, a great mechanic, who first applied air as a motive power, and invented a water-clock and a hydraulic organ, some 200 years ago. The fathers of Sir Richard Arkwright, Lord Tenterden and Lord St. Leonard need razors to gain a living.

The Application of Zinc to Iron.

A continental journal quotes some interesting particulars regarding a new method of applying zinc to iron. It is stated as a fundamental principle that protection from rust only is afforded by that layer of zinc which has become united to the iron by electro-chemical process, having lost its properties as zinc, and thus not being liable to further oxidation. Any excess of zinc must, therefore, be regarded not only as useless, but also injurious. It is further stated that iron to which zinc is applied by this new process does not peel, and can be soldered with either hard or soft solder. Not only does it perfectly resist all influences of temperatures, but it can be heated without injuring the layer of iron and zinc alloy, or affecting its protective action.

As a preliminary, the iron is cleaned by being subjected to the action of a mordant. It is then drawn through a solution of chloride of zinc, a little ammonia is thrown upon it (or else it is put through a solution of ammonia) and it is then immersed in the zinc bath. The new apparatus is placed near the heating appliance, and is so constructed that two rotating cylinder brushes are placed over the vessel containing the zinc, and can be brought nearer to or removed from each other in a horizontal position, even during their rotation. When the iron plate is to be placed in the zinc bath the brushes are moved sufficiently far apart to allow of this being easily done. The iron remains in the bath until it has assumed the temperature of the contents. The metal is then lifted out of the bath sufficiently for its upper portion to reach the middle of the steel cylindrical brushes, which are put into rotary motion by this mechanism, and are brought so near each other that both sides of the metal are subjected to their action. Their velocity is regulated by their distance from the surface of the zinc bath, and by the thickness of the metal to be treated. These points are of importance, and can be taken into account during the construction of the apparatus. The superfluous zinc is removed by the brushes while in a soft condition, so that only the clean zinc alloyed layer is visible after the operation. This layer is not a coating of zinc, but is the original surface of the iron, and therefore inseparable from it. The metal thus treated can be worked in various ways without any risk of the zinc becoming detached, as is now the case. It is likewise claimed for this process that it imparts to the metal the property of taking a polish or being galvanized with any desired metallic coloring.

RUBBING SURFACES.—The committee of master mechanics on crossheads and guides puts itself on record as follows in relation to rubbing surfaces: "There can be nothing better for rubbing surfaces than cast iron, if well lubricated. If it is exposed to dust and cinders, it would be well to use strips of Babbitt metal, but with the Dean crosshead, which always runs in clean oil, this is unnecessary. Phosphor-bronzes give admirable results for crosshead gibs. Whatever form or material is used for crossheads and gibs, the rubbing parts should always be well scored with grooves for retaining oil to supply the moving parts as they journey back and forth." This opinion, says the *American Machinist*, is important as indicating the view of practical men upon a question upon which there has been considerable difference of opinion. The utility of such opinions is not, of course, concluded by locomotive practice, but the views expressed are equally worthy of consideration by mechanics in every line of machinery.

MAKING COPPER STEAM PIPES.—Steam pipes of copper are now made by electro deposition from sulphate of copper solution. The pipe is formed on an iron core in the depositing bath, and the deposited copper is pressed by a moving tool as it is deposited, so as to give a fibrous strength to the crystalline copper. After the pipe is thus formed it is subjected to hot steam, which expands the copper shell, or pipe, clears off the iron core, thus separating the two. These pipes have no joint, and are said to be very strong, tests showing that they break with strains of from 27 to 41 tons per square inch.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—The eighteenth convention of the American Society of Mechanical Engineers will be held in Scranton, Pa., beginning Monday evening, October 15th. The meeting comes somewhat earlier this year than usual in order that the hill country of Pennsylvania may be enjoyed to the best advantage. Particulars of the program and papers to be read will appear later.

SCIENTIFIC PROGRESS.

Shooting Stars — The Possible Origin of Comets.

But very little is definitely known in regard to the origin of meteors and shooting stars. Some hold that they are all one and the same—others that the one is a nebulous body originating from nebulous matter within our solar system and that the other is composed of more ponderous substances, and consists of the breaking up of solid bodies—planets or comets. What we do know of them has been briefly summarized as follows:

1. They are vastly more numerous than any one has any idea of who has not watched them continuously for many nights. Astronomers who have kept a record for many years assure us that the average number seen by one observer at one place on a clear, moonless night is 14 per hour, which is shown by calculation to be equivalent to 20,000,000 daily for the whole earth.

2. They are not terrestrial phenomena, moving in the lower atmosphere, but celestial bodies moving in orbits and with velocities comparable to those of planets and comets. Their velocities are seldom under 10 miles a second or over 50, and average about 30, the velocity of the earth in its orbit around the sun being 18. They are of various compositions, comprising both a large majority of smaller particles which are set on fire by the resistance of the earth's atmosphere and entirely burned up and resolved into vapor long before they reach its surface, and a few larger ones known as meteors, which are only partly fused or glazed by heat, and reach the earth in the form of stony masses.

3. They are not uniformly distributed through space, but collect in meteoric swarms or streams, two at least of which revolve around the sun in closed rings which are intersected by the earth's orbit, causing the magnificent display of shooting stars which are seen in August and November.

4. They are connected with the comets, it having been demonstrated by Schiaparelli that the orbit of the comet of 1066 is identical with the August swarm of meteors known as the Perseids, and connections between comet and meteor streams have been found in at least three other cases. The fact is generally believed that comets are nothing but a condensation of meteorites rendered incandescent by the heat generated by their mutual collision when brought into close proximity.

5. Their composition, as inferred from the larger meteors which reach the earth, is identical, or nearly so, with that of matter brought up from great depths by volcanic eruptions. In each case they consist of two classes—one composed mainly of native iron alloyed with nickel; the other of stony matter, consisting mainly of compounds of silicon and magnesium. Most meteorites consist of compounds of the two classes, in which the stony parts seem to have broken into fragments by violent collision and become imbedded in iron which has been fused by heat into a plastic or pasty condition.

The Scope of Scientific Education.

A Jesuit with whom I was conversing on educational questions once told me, in depreciation of my position as a man of science, that the naturalist of to-day can be a physiologist or a physicist, mineralogist, geologist, zoologist, botanist, or chemist, and no more. He cannot overlook the whole of science, and can at most only really know a part of his own branch, from which he is not, of course, justified in drawing any general conclusion.

It was otherwise with the Jesuit, who excluded himself from no department of knowledge. This man touched accurately what is now recognized as a growing peril to the general significance of science in mental development—the continuous contraction of the individual's fields of labor, or specializing. It is right for naturalists in these days to make themselves masters in their own branch, and masters usually in that alone, unless they are in a position to obtain a survey over the whole of the sciences. But it is wrong, in the present condition of knowledge, to deny them a general acquaintance with all scientific matters. That would be to put their capacity below that of the Jesuit, who only desires to obtain a superficial view of science in order to aid him in holding his position in sophistical disputations against it and in favor of his own dogma.

Most naturalists and scientifically educated persons have, moreover, been trained in a liberal range of studies, and are well qualified to form a judgment on general scientific as well as upon important and fundamental philosophical questions. Yet we are living, to a large extent, upon the provision left by the fathers. The dividing up is daily becoming more and more minute, and is destined in time to throw a broad shadow over the outlook, unless the demand for a many-sided basis of training as a defense against the evil is universally insisted upon.—From "*Specialization in Science*," in *Popular Science Monthly*.

CORROSION AND BRITTLINESS.—The *Journal of the British Society of Chemical Industry*, in a recent issue, remarks that brittleness after corrosion is exhibited by all kinds of iron and steel, and is more marked if a plate of amalgamated zinc be connected with the iron, so as to

form a couple in the solution. It cannot be ascribed to accidental flaws in the metal employed. If two iron wires are made electrodes in a bath of sulphuric acid, the anode will be much attacked, but will be scarcely affected in regard to brittleness, while the cathode will become bright on its surface, but will be extremely brittle. Hughes and Robert ascribe this effect to the occlusion of hydrogen by the iron. After a long series of researches, it has been found that the character of iron and steel is always altered if exposed to influences which occasion an evolution of hydrogen upon the surface, and that contact of the iron with zinc intensifies this effect, so that a shorter time is necessary to produce it. The resistance to flexure, as well as the transverse strength, is always diminished, as is the extensibility under tension, while the modulus of rupture is practically unaltered, unless in some cases by the excessive corrosion itself. Heating the metal suffices to remove the brittleness, and placing it in a dry place for some time may have a similar effect, but mechanical working in the cold is without effect in this direction. Cast iron is not influenced, or is less so than wrought iron, by superficial hydrogen development. Four samples of corroded iron, heated carefully in pure dry nitrogen, gave off 0.0021 to 0.0052 per cent of hydrogen respectively—numbers which, it is thought, cannot represent quite the whole of the hydrogen actually present.

ORIGIN OF ARTESIAN WELLS.—The sedimentary rocks in their great thickness enclose a succession of water sheets or water-levels occupying distinct stages and extending with uniform characters under whole countries like the strata to which they are subordinated. It is proper to remark here, says *Popular Science Monthly*, that by the term water-sheet is not meant a real bed of water lodged in a cavity between solid masses that serve as walls to it, but water filling the minute interstices of the cracks of a rock. Continuous and regular in sand, these sheets are usually discontinuous and irregular in limestones and sandstones, in which the water only occupies more or less spacious fissures. When natural issues are wanting, human industry is able, by boring, to make an opening down to the subterranean waters, which it causes to jet up to the surface and sometimes to a considerable height above. The thought of undertaking such works is a very ancient one. The Egyptians had recourse to them 40 centuries ago, and they were executed in France in 1126 at Artois, whence the name of artesian wells has been given to them. The water-levels of the cretaceous strata, from which the French artesian waters issue, are not always of advantage; but in the north of France and Belgium they constitute the most formidable obstacle which miners have to encounter in reaching the coal-heds. A striking confirmation of the theory of the surface of supply of the artesian waters has been observed in Tours, where the water, spouting with great velocity from a well 110 meters in depth, brings up, together with fine sand, fresh water-shells and eeds in such a state of preservation as to show that they could not have been over three or four months on their voyage. Some of the wells of the Wady Rir have also ejected fresh-water mollusks, fish and crabs, still living, which must, therefore, have made a still more rapid transit.

A LARGE TERRESTRIAL GLOBE.—According to *Nature*, a large terrestrial globe, constructed on the scale of one-millionth, will be shown at the Paris exhibition of 1889. A place will be set apart for it in the center of the Champ de Mars. The globe will measure nearly 43 feet in diameter, and will give some idea of real dimensions, since the conception of the meaning of a one-millionth is not beyond the powers of the human mind. Visitors to the exhibition will see for the first time on this globe the place really occupied by certain known spaces, such as those of great towns. Paris, for instance, will barely cover a square centimeter. The globe will turn on its axis, and thus represent the movement of rotation of the earth. The scheme was originated by MM. T. Villard and C. Cotard, and *Nature* says that it has been placed under the patronage of several eminent French scientists.

WROUGHT-IRON WORK.—An English paper says: Wrought iron, very black and old looking, is among the latest pinks of fashion in household ornaments. The black forms a pleasant contrast with the ambers and flame colors and gray-blues so largely used. An order has just been given by a retail house for canning little salt-cellars of silver set in wrought-iron frames and wrought-iron casters picked out with silver Celtic designs. It is a great relief from the everlasting brasswork, and newer than silver ornaments. There is too little attention given to making silver ornaments. Artistic silver is not beautiful enough in itself to stand the commonplace hideous designs one sees so often. A beautiful thing in brass or copper, iron or steel is preferable to any ugly thing in silver.

CLOCKWORK IN PHOTOGRAPHIC PRINTING.—An interesting development in photography is in the use of clockwork in printing from negatives. By this means a continuous web of sensitized paper is drawn at suitable intervals under a negative exposed to a source of light. After printing, the paper is drawn, still by the mechanism, through "washer," "toner" and "fixer" successively, and appears finally as a series of finished pictures, ready for mounting, and all alike in exposure, color and tone.

GOOD HEALTH.

Health of the State.

The regular monthly report of the State Board of Health for July gives returns from 100 localities, in 15 of which there were no deaths during the month. Eighty-five cities and towns report a total of 958. Of this number, San Francisco is credited with 519. When it is borne in mind that this city is set down with a population of 300,000, while the other localities are credited with a total of 407,550, it would appear at first sight that the deaths in this city were altogether an undue proportion. But when we take into account the fact that very many people when taken sick in the country come to San Francisco for treatment, this disproportion may be thus accounted for.

The monthly percentage of deaths in those localities reported upon is 1.31 per 1000. During the month of July, according to the mortality reports received from 85 cities and towns within the State, 958 deaths occurred in an aggregate population of 707,850 persons. This is a monthly rate of 16.08 per 1000. In the classification by diseases, consumption is far in the lead, the number of victims of that disease being 127, while the next highest, which was heart disease, was 72. The list of deaths by consumption, says the report, is remarkably small, being a decrease of 19 from the last report.

There were 12 deaths in Pasadena and vicinity, with a population of 6000, while there were nine deaths in Stockton, with a population of 15,000. These figures do not tend to prove that Pasadena is not as healthy a place as Stockton. Pasadena contains a large number of incurable invalids from abroad, and when these die the death rate is abnormally swelled. Sacramento, with 30,000 population, had but 37 deaths, and San Francisco, with 300,000, had 519 deaths. There are also many invalids from other parts of the State in San Francisco hospitals. If a person gets sick in notoriously unhealthy place, he removes to, and often dies in, a well-known healthy place, so that the death rate of a locality is absolutely of no value in determining its salubrity, unless the former residence of the deceased person is also given.

Cancer.

We notice that the Health Report sets down 24 cases of death from cancer in this city during the month of July, and only 19 for all the other towns and cities reported, although the other cities and towns are credited with more than one-third larger population than San Francisco. This disproportion is to be accounted for by the fact that large numbers come to this city to be treated and die here. We would suggest that, in view of the rapid increase of this terrible malady, there should be a special hospital established in this city for the care and treatment of this disease. Such a course is all the more called for for the reason that it would give an opportunity to more readily observe the different modes of treatment applied to this disease and to judge of their respective value.

Cancer is a disease which strongly appeals to the sympathy of the public from its terrible agony, its inexorable persistency and the frankly acknowledged inability of the medical faculty to stay its progress. It is, moreover, increasing all over the world more rapidly than any other disease. It is this one dread malady which seems to grow and increase with the progress of civilization. Will not some of our wealthy and philanthropic people take this matter in hand? We know of no movement in that direction which would promise more useful and important results. New York has such a hospital, and many other cities in various parts of the world. Why not San Francisco? We understand that suggestions to this effect have already been made, and we trust the matter will not be suffered to rest until its final accomplishment is reached.

LEMONADE.—The use of lemonade, or water acidulated with lemon juice, is proper in warm weather. This acid produces effects that are agreeable, because it lowers the temperature of the system. Of course lemonade should be taken in moderation, like all beverages. Workmen drink too much in hot weather, overtax the excretory organs, and weaken themselves in consequence. A good drink for workmen in mills and foundries is oatmeal-water, with a little lemon-juice or raspberry-juice to give it a flavor. A few sips of this, three or four times a day, are far better than the tumblerfuls of iced water that are poured into the hot stomach. Serious harm often results from excessive iced-water drinking. We doubt not that the majority of sudden deaths among laboring people in summer are due to over-drinking of ice-cold water and of saloon drinks.

IMAGINARY PAINS.—Our readers are familiar with the oft-recurring instances of imaginary pains and cold in amputated limbs. Most people can call to mind, in their own observation, persons who, having lost a leg or an arm, still complain of pains in the extremities of those limbs years after they have been removed. Of course these pains are purely imaginary, but as such are real to the sufferers. A correspondent of the *Phrenological Journal* recites an instance of the manner in which a patient overcame such effects of the imagination much to his comfort. This friend had lost his right hand by hav-

ing it terribly mangled in a planing machine. Having heard and read a great deal about people enduring pain in amputated limbs, he immediately made up his mind that he would not suffer pain in the arm that he had lost; and as soon as the mutilated flesh and bones were removed, he courageously "located the pain where it was" (to use his own expression), viz., "in the stump of the severed arm." Instantly on feeling a twinges of pain reaching apparently into the lost hand and fingers, he would place the remaining hand where the amputated member had been, thus bringing to his mind an immediate realization of the fact that the arm was gone, and so could not be subject to pain. After about two weeks of this "heroic mental treatment" the idea of pain in the severed member was entirely overcome; and though the accident happened six years ago, he has never suffered from a return of it. A like procedure on the part of all persons who are so unfortunate as to meet with the loss of a limb would, we believe, bring about the same result.

CHOLERA.—The July report of the State Board of Health makes the following timely remarks in regard to the cholera: "Cholera is prevalent in Hongkong, and has made its appearance again in Japan. The proximity of cholera, through the constant commercial intercourse between these countries and our own, renders us peculiarly exposed to an invasion of the disease, recollecting the persistence with which cholera germs maintain their existence under the most adverse circumstances. With bowel disorders so prevalent as they are now, the human system is in a condition of receptivity that would readily become infected and develop the disease in its most fatal form. Sir Joseph Fayer, from his great experience in India, maintains that under certain circumstances cholera morbus, or summer cholera, may become epidemic, and is indistinguishable from Asiatic cholera, variation being in severity and not in kind. It is, therefore, prudent to avoid all known causes of bowel disorders, especially overripe or decayed fruit, and all noxious emanations from any source. The strictest hygienic measures should be enforced within our cities, our dwellings and surroundings. All garbage and decaying organic matter should be buried or deeply buried, out-houses cleaned and whitewashed, as cholera, if it once invades our State, will spare none but those who have made themselves secure by sanitary forethought and precaution."

USEFUL INFORMATION.

How to Act at a Fire.

In a lecture before the Society of Arts, London, Mr. A. W. C. Ghean gave the following concise and simple direction how to act on the occurrence of fires: Fire requires air; therefore, on its appearance every effort should be made to exclude air—shut all doors and windows. By this means fire may be confined to a single room for a sufficient period to enable all the inmates to be aroused and escape; but if the doors and windows are thrown open, the fanning of the wind and the draught will instantly cause the flames to increase with extraordinary rapidity. It must never be forgotten that the most precious moments are at the commencement of a fire and not a single second of time should be lost in tackling it. In a room, a tablecloth can be used so as to smother a large sheet of flame, and a cushion may serve to heat it out; a coat or anything similar may be used with an equally successful result. The great point is presence of mind—calmness in danger, action guided by reason and thought. In all large houses buckets of water should be placed on every landing, a little salt being put into the water. Always endeavor to attack the bed of a fire; if you cannot extinguish a fire, shut the window and be sure to shut the door when making good your retreat. A wet silk handkerchief tied over the eyes and nose will make breathing possible in the midst of much smoke, and a blanket wetted and wrapped around the body will enable a person to pass through a sheet of flame in comparative safety. Should a lady's dress catch fire, let the wearer at once lie down. Rolling may extinguish the fire, but if not, anything (woolen preferred) wrapped tightly round will effect the desired purpose. A burn becomes less painful the moment the air is excluded from it. For simple burns, oil or the white of an egg can be used. One part of carbolic acid to six parts of olive oil is found to be invaluable in most cases, slight or severe, and the first layer of lint should not be removed until the cure is complete, but saturated by application of fresh outer layers from time to time. Linen soaked in a mixture of equal parts of lime-water and linseed oil also forms a good dressing. Common whitening is very good, applied wet and continually dampened with a sponge.

CARE OF GLOVES.—When removing gloves never begin at the tips of the fingers to pull them off; turn back the wrist and draw them off wrong side out. Before putting them away turn them right side out and smooth them out lengthwise. Never roll them up tightly, one inside of the other, as whatever moisture they may have gathered from the hands dries in this way very slowly and makes the kid stiff and hard. Strips of cotton flannel are good to lay between gloves. Dry cornmeal will clean gloves nicely, but if much soiled it is better to send

them to a reputable cleaner. Benzine will clean white gloves, but it is not to be recommended where there is any color. Where black kids have become rusty about the finger ends they can be restored by adding a few drops of good black ink to a teaspoonful of olive oil and applying with a feather or camel's-hair brush.

TESTING EXTERIOR STAINS.—Since the use of stains for exterior work became so general, several stains, some good and some bad, have appeared on the market, so that a few points on estimating their comparative values may not be amiss. The nose, and, to a less degree, the eye, are admirable allies for this work, but unassisted are not infallible. The following is about the simplest method of testing: 1. Search for kerosene by warming and then noting the smell. Also, note the thinness and lack of covering-power which kerosene causes. Kerosene is simply a cheapener. 2. See how fine it brushes out on a smooth shingle. There should not be the slightest grit or any perceptible grains of pigment, the presence of which will prove that the coloring was mixed dry with the vehicle and was never ground fine. 3. Pour out some of the stain in a tumbler. If it begins to settle at once, except in the case of a chrome-yellow or green, it is made as above stated, by mixing a dry paint with the vehicle, and therefore should be avoided. A well-ground oil stain tested in this way held up a whole day, and a oresote stain a day and a half. Of course, when debating between two stains, it is best to try them side by side. In such a case the comparative color-strength may be determined by diluting equal quantities of both stains of about the same shade with equal quantities of turpentine and then applying the diluted colors to wood and noting the depth of color. One part of stain to ten parts of turpentine is a good strength. A wise precaution is to conceal the fact that the samples are for trial, as the makers, so far as known, are mortal. They should be thought by some one not known as an architect.

ARTIFICIAL SILK.—Artificial silk is the latest discovery, and judging from the details of it that are to hand, it seems likely that the silk-worm's occupation will soon be gone, and that he may retire to his cocoon and lament his lost importance in silence. The new material is made, we are told, from a kind of collodion, to which has been added perchloride of iron and tannic acid. The process of manufacture is somewhat complicated, but the result seems to be all that can be desired in the way of providing a substance practically equal to good silk.

LANGUAGES.—It has been estimated by Professor Kirchhoff of Halle that the language most spoken on the globe, for the last thousand years at least, is Chinese, for it is without doubt the only one which is talked by over 400,000,000 of the human race. The next language most in use, but at a very great distance behind Chinese, is Hindustani, spoken by over 100,000,000. Then follow English (spoken by about 100,000,000), Russian (over 70,000,000), German (over 57,000,000), and Spanish (over 47,000,000).

A PECULIAR DEPOSIT.—A peculiar deposit, which resembles clay in pliability, but which, when exposed to the air, becomes as hard as granite, has been discovered at the base of Bear Mountain, near Taylorville, N. C. Blocks of it have been dug out and used for all the purposes of stone with success, and it is proposed to build houses of it.

PRODUCE EXPORTS FROM SAN FRANCISCO for the first seven months of the year amount to \$18,829,000, against \$19,474,000 for the corresponding period last year. The imports in the same time were \$30,550,000, against \$25,052,000 in 1887. The imports of specie were \$1,834,000, against \$2,885,000 in 1887.

COLORS FROM COAL TAR.—About 150 colors are now obtained from coal tar, which have almost entirely supplanted vegetable and animal dyes. Indigo and logwood are the only two of the latter class considered of much importance.

EXTINCTION OF BIRD SPECIES.—The statement is made that no less than six species of North American birds have become extinct during the last 10 years, and it is claimed that English sparrows were the main cause.

EFFECTS OF SACCHARINE.—A constant and disagreeable sweet taste in the mouth has been reported as a result of saccharine, this new concentrated sweetening material.

ZINC AND QUICKSILVER.—A new process for amalgamating zinc and quicksilver without the admixture of any other material, it is stated, has just been invented.

There is one admirable feature about a wire fence. The patent-medicine man can't paint a legend upon it in regard to his liver cure.—*Puck*.

The organ was invented by one Ctesihus, a barber of Alexandria, about 100 B. C.

There are 130,000 liquor saloons in England, 20,000 of which are in London.

The first notice of aurora borealis in England was on March 6, 1716.

Rewards for New Gold-Fields.

In the colony of Victoria, Australia, rewards are given for the discovery of new gold-fields. The person is considered the discoverer who first finds gold, marks out a claim, and notifies in due time the warden or police magistrates of the district. No rewards exceed \$5000. In fixing the amount to be paid for any discovery, regard is had to the number of men employed in the new gold-field, its distance from the nearest gold workings, the character of the deposits in which the gold occurs, and the depth of sinking. If two or more persons simultaneously discover gold in the same locality, in a place immediately adjacent, and they each severally comply with the conditions, the sum to be awarded is divided in such a manner as is just.

Rewards are given in accordance with the following scale:

A. For the discovery of a gold field distant more than one mile and not exceeding two miles from the nearest gold workings, and on which there shall be employed three months after the report of the discovery having been made not less than 200 men, a sum not exceeding £200.

B. For the discovery of a gold field distant more than two miles and not exceeding three miles from the nearest gold workings, and on which there shall be employed three months after the report of the discovery having been made not less than 200 men, a sum not exceeding £300.

C. For the discovery of a gold field distant more than three miles and not exceeding five miles from the nearest gold workings, and on which there shall be employed three months after the report of the discovery having been made not less than 200 men, a sum not exceeding £400.

D. For the discovery of a gold field distant more than five miles from the nearest gold workings, and on which there shall be employed three months after the report of the discovery having been made not less than 200 men, a sum not exceeding £500.

E. For the discovery of a gold field distant more than five miles from the nearest gold workings, and on which there shall be employed six months after the report of the discovery not less than 500 men, a sum not exceeding £1000.

San Luis Obispo Oil.

Notwithstanding the depreciating remarks of sundry doubting Thomases and smart Alcks, who are stout in their opinion that the efforts which have so far been made to reach the deposit of petroleum, which it is believed underlies this part of the country, have resulted in nothing, there is a good deal of stir on the subject. We learn of quiet efforts to get hold of land deemed hopeful for exploring purposes, and it is quite certain that if any positive discoveries are made, at the first appearance of oil in promising quantities, a good deal of capital will be devoted to following up the matter. Several tracts have already been bonded, we understand, among others, 1000 acres of the Grover and Gates tract at Pismo, for \$50 an acre to Los Angeles parties, and certain tracts in Oak Park. Judge Adams tells us that the product of the Carpenter well has been submitted to Los Angeles experts who assert that it is the genuine article of green oil and of fine quality. There is, of course, the element of doubt as to the extent of the deposit, but there seems no reason to suppose that there can be any wide difference between this section and that a few hundred miles south; the character of the country and the indications being so nearly identical. A story is reported of a Standard Oil Co.'s agent who was anxious to make a personal inspection, a day or two since, and after receiving instructions as to his route, etc., departed. A few hours later he returned in a state of astonishment at the developments. It was one of the biggest things he had ever seen; oil in any quantity, and as for quality, why, he touched a match to it and the flames flew six feet in the air, burning his wrist quite severely. This surprising piece of news drew on a cross examination, from which it appeared that the stranger had been steered to the Miles Station Oil Well, instead of to Mr. Carpenter's new development.—*Tribune*.

FINE MINERAL REGIONS.—Following are said to be fine fields for the prospector who possesses the advanced knowledge of the present day in geology and mineralogy: Silver Zone district, in the Steptoe range of mountains; Buel district, south of the Central Pacific, on the Utah line; Delano district, northwest of Tacoma; the Goose Creek range and Mount Merritt, 16 miles north of Mountain City. In all these districts some prospecting work was done 15 or 20 years ago; in all more or less paying ore was found, and in a few, as Buel district, paying ore was extracted and worked. At the time these districts were discovered and organized the explorers were all men of small means; they had pushed out too far from the base of their supplies and had left the capitalists hundreds of miles behind. At that time it was a very difficult matter to get a man of capital further into the country than the Comstock. The man who pushed out into the regions in the wilds in the early days soon found that the times were not ripe for the opening up of mines in far-away fields. When the small means they themselves possessed were exhausted they were obliged to strike back into the settlements and civilization; they could not induce ones of capital to go out into the wilderness.—*Virginia Enterprise*.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—*Ledger*, Aug. 18: A rich strike was made in this mine a few days ago. In running a drift west, they struck a small vein of quartz, about six inches thick, which is included in a main ledge 20 feet wide. This seam is sprinkled with free gold. It has been followed a distance of nearly 20 feet, and the ore shows gold visible to the naked eye all the way. Such rock ought at least to yield \$100 per ton. A change of foreman has again taken place. Mr. Pearce left for San Francisco early this week, and George Francis from Grass Valley, and who eight years ago was foreman of the Zule, has taken his place. Preparations are being actively pushed for the erection of the 60-stamp mill. The grading is about completed, and a quantity of the lumber is already on the ground. The mill will take something like 400,000 feet of lumber, and several sawmills are engaged in filling the order, as the quantity is too much for any one mill to cut in addition to other work.

MISCELLANEOUS.—Nearly 20 men have quit work at the Kennedy within the last week or two. It is said the cause is the fear of a cave in the south drift at the 700-foot level, where most of the ore is being extracted that supplies the mill. The men say that the signs in that portion of the mine point to a probable cave, and quit rather than run the risk of working there.

PROMISING.—*Cor. Amador Ledger*, Aug. 18: The Leggett & Manditch claim, that has lately been discovered about six miles above here, continues to look very promising. They have commenced sinking, with the intention of going down 200 feet, and if the prospects at this depth are as good as at present, they will be justified in putting up a ten-stamp mill.

Butte.

QUARTZ MINING.—*Oroville Register*, Aug. 16: A new era in quartz mining has dawned upon Butte. Ledges are being developed at Forbestown, Merriam Mills, on French creek, near Magalia, at Oregon City, near Oroville, and in other sections. Not less than 150 men are at work on quartz, either prospecting or getting out ore. Extensive developments at Forbestown show rich ore, and a large force of men is working to put the mines in the best shape for good returns. Farnham & Rowell's mine, near Merriam, shows fine ore, and a new ten-stamp mill will commence crushing it this week. A good deal of work is being done at the Banner mine up the river from here and excellent ore development is reported. A large amount of prospect work is being carried on in the county and several new ledges have recently been found.

Calaveras.

DURYEA GOLD MINE.—*Calaveras Chronicle*, Aug. 18: This mine, being one of the oldest on the line of the Mokelumne and Campo Seco canal and running water steadily, has the preference over all other mines when the water becomes scarce. This for a number of years was worked as a hydraulic mine. Several acres of ground were washed off the east and west rim, from which it is estimated over \$500,000 was taken out. The bank then being about 150 feet in height, dump for tailings filling and bedrock pitching below the grade of the flume, made it difficult, if not almost impossible, to bottom the channel by hydraulic process, in consequence of which, during the last three years, the claim has been worked as a drift mine. A long, deep drain was cut through bedrock and boxes placed in, which at the time was thought to be low enough to drain the whole mine. A tunnel was also commenced and the drain carried with the tunnel. After getting in some 400 feet the bedrock pitched below the drain. Then the main tunnel was run on the east rim of the mine on a level with the drain for about 2000 feet, all through pay gravel. A five-stamp mill had been erected, and feeling anxious to run the mill steady, a crosscut on the same level was run to the west for 300 feet, which was supposed to be about half-way across the channel, as where the surface had been removed by hydraulic process the rim from east to west measured about 700 feet. Breasting back was commenced on this tunnel with good results. At the same time No. 2 tunnel was started off the main tunnel, 50 feet from the No. 1. All tunnels were run 300 feet in and 50 feet apart; breasting back 25 feet on each side, and working the gravel 14 feet high in two lifts from the present water tunnel level, leaving the best pay and coarser gold under foot. Mr. Duryea showed us some chunks of gold that came from gravel taken under foot below his tunnel level. This gravel was taken as a test, and supposed to be 8 or 10 feet from the bedrock. The chunks showed us averaged all the way from \$5 to \$80 each. The mine is well opened, having at present over 1800 feet of tunnels. There is also a tunnel in over 500 feet on the west rim, and when needed will crosscut the old works down from the east rim tunnel. The mine employs from 20 to 25 men, and about 40 tons of gravel are crushed daily with a five-stamp mill. The gravel is hauled off by mules.

ANGELS.—*Cor. Calaveras Prospect*, Aug. 17: Angels is enjoying good and prosperous times, and there is every reason to believe that the present prosperity is something permanent. Capital is taking hold of all the best mines and prospects for the purpose of making complete developments, and the outlook for valuable results is certainly fair, and could not be better without being extraordinary. Water has become low and in consequence some of the mills have shut down temporarily. We learn that a run of little over half a month in the Ulica resulted in a recent cleanup of about \$700. Vast improvements are noticed about this mine, now the property of Hayward & Hobart. This company is digging a new mining ditch, which will extend some distance above Murphy's, yet when completed will be shorter than the old ditch now in use. The Nevills mine is doing some blasting in the ledge of the old diggings in front of the schoolhouse. This mine is also looking well. Whether or not the G-Jid Cliff will ever start up again is an every-day conjecture; but it is believed that operations will be resumed in the fall. Andrew Lane & Co. have purchased the Matson mine south of the Gold Cliff, and the erection of a five-stamp mill is now going on.

Carson Hill and Robinson's Ferry are now exciting the closest attention from mining men. If the present indications are half realized, that locality will be before long undergo a great transformation from its dormant condition of to-day to one of the busiest activity, employing many hundreds of men in the extensive operations to be commenced hereafter. We hear that the London syndicate, about which so much was said some time past, will soon commence its work. The new mill of the Tryon mine has shut down for the want of water.

MURPHYS.—*Cor. County Record*, Aug. 15: Mining in this vicinity is progressing favorably. The Barattini mill recently erected on the Drussel and Heinsdorf mine, started up last week, and so far does the work satisfactorily. It is the invention of Mr. Stevenson of Douglas Flat. Mr. Barattini of this place is his joint patentee. The mill is five tons in 24 hours. Their capacity, however, is only limited by their size. The Norfolk Mining Co., which lately purchased the Morse and Stone group of mines in close proximity to Murphys, lying east of us, is working a large force of men, making preparations for the successful working of their property. Other mines in the district and adjacent to it are pushing work to successful developments, some of which bespeak for them rich returns. The Central Hill Gravel Mining Co. has tied up for the season, after the final cleanup. The growing scarcity of water was a reason for closing down. They contemplate running a tunnel to tap the vein at greatest depths.

NEAR MOKELUMNE HILLS.—*Calaveras Prospect*, Aug. 17: The A and B mine, What Cheer, Quaker City, Burleson, and others about Mokelumne Hill and vicinity, have closed down on account of the scarcity of water. The mines depend for water-power on the Mokelumne and Campo Seco canal.

HOISTING WORKS.—*Angels Echo*, Aug. 15: The work of building the new hoisting works at the Ulica mine is going on actively. Timbers are now being hauled from McKay's sawmill for the building of similar hoisting works on the south shaft.

El Dorado.

MILLING.—*Georgetown Gazette*, Aug. 18: The mill at the Alpine mine is running day and night and is crushing from 35 to 40 tons per 24 hours. Several of the owners were here this week, and we understand that an additional force of men will be put on. This company has not put on any of the unnecessary extras which many companies have to pay for.

TO START UP.—*Placerville Observer*, Aug. 21: The Tincup mine on Webber creek, we are informed, is to be put in operation in a few days. This will be good news to all, and especially to the miners. Bob Calvin starts in this week to lay the balance of the pipe by which the 10-stamp mill will be supplied with water.

SLATE.—The California Slate Co. is preparing to ship several carloads of slate. This is an industry the importance of which is scarcely realized by our people.

STILLWAGON.—O. S. Graves, superintendent of the Stillwagon mine, reports the outlook for that mine as decidedly promising.

Fresno.

GOLD, SILVER AND IRON.—*Mount Raymond Cor. Fresno Republican*, Aug. 16: The activity now being exhibited here by the Star Mining and Reduction Co. certainly looks as if we were now entering on an era of prosperity and good times. The company has just completed a first-class wagon-road from Fish's camp to the Big Springs, where they have commenced the erection of their reduction works, which they hope to have in operation before snow flies. The company will commence operations on their mine in a few days, extracting ore and making preparations to continue work all winter. Part of their machinery has arrived at Raymond station and will be shipped here as soon as possible. The operations of this company are very essential to the future success of the working of low-grade ores in this district as well as the State in general. Their system of concentration of low-grade ores will be the means of adding largely to the lead, silver and gold production of this State. The Star mine, for which the reduction works are being built, is situated near the summit of Mount Raymond, about one mile from the works. The ore is very abundant and lies in masses of considerable size and carries a large percentage of galena, which assays high in both gold and silver. There has always been a question among California mining men whether the ores of Mount Raymond could be successfully and profitably worked, but none of our energetic mining men having a personal knowledge of this character of ore seemed willing to undertake the demonstration of it. But in far-off Montana some practical men hearing of our large deposits of ore came here and were pleased at what they saw, and immediately opened negotiations for the purchase of the Star mine, formed a company and came here with the intention of building up a legitimate enterprise. Our iron deposits here are very extensive, and with cheap transportation they could be worked to a good profit. The Black Prince mine, located on our iron belt, shows a mass of iron over 20 feet thick, and the vein has been traced a distance of nearly two miles. It is hematite. It appears to be of excellent quality and is remarkably pure and free from intermixture with rock.

Placer.

STAMP-MILL.—*Grass Valley Union*, Aug. 21: Recently Hon. James G. Fair and E. A. Davis of San Francisco purchased the Pioneer quartz property, situated on Humbug canyon, a few miles east of Iowa Hill. The vein which is from 12 to 18 feet in thickness, has been opened upon by tunnel in several places, and a sufficient quantity of good ore uncovered to warrant the building of a mill. The owners have therefore determined to erect a 20-stamp mill now, and increase the capacity of the mill when the mine is more fully developed. The contract for the construction of the mill has been awarded to Rix, Firth & Pitchford, proprietors of the Phoenix Iron Works, San Francisco. The mill and other works are to be built according to specifications drawn by J. B. Pitchford, the well-known mining machinist, who made the specifications for the North Star mill of this district, than which there is no superior mill in the State. The Phoenix Iron Works has sub-contracted for the erection of the machinery and buildings with Wm. S. May of Grass Valley, who as an excellent millwright has a

wide reputation. The mill is to be located 3000 feet from the main tunnel on the Pioneer vein, and about 1000 feet below it. There will be a tramway about 3000 feet in length, laid with railroad iron, and cars of two or more tons capacity will be used for transporting the ore to the mill. These cars are to be self-dumping, and the loaded cars going down will pull up the empty cars. Water-power will be used for running the mill, with a pressure of 600 feet, and separate wheels will be used for the battery, concentrators and rock-breakers. The pipe line (12 inches in diameter) will be 1500 feet in length. The work is to be completed and the mill in running order in 90 days from this date.

PROSPECT.—*Placer Herald*, Aug. 18: E. P. Floyd is running a tunnel about a quarter of a mile below the Stonehouse, on his quartz lead. He is in 30 feet and is getting a good prospect.

Nevada.

GRANITEVILLE MINING NOTES.—*Grass Valley Union*, Aug. 17: The Rocky Glen mill, in Graniteville district, is running night and day on ore from the mine, which is showing well. The lower tunnel in the Baltic mine we hear has struck a two-foot ledge, but we could get no further particulars. The California tunnel, near Graniteville, struck a four-foot ledge last week, but the work is being extended to that ledge, which will require about 50 feet more to be run. The back ledge is the one Mr. Foley has been working on since he took charge of the mine. The rock in the front ledge where the tunnel struck it, looks well, but none of it has been crushed yet.

MINE BONDED.—*Nevada Transcript*, Aug. 18: Myron Foote has bonded the East Banner quartz claim at this city to Walker Bros., the well-known bankers of Salt Lake, U. T., for a period of 90 days. R. G. Lansing, expert for the Walker Bros., is now here examining the property, and if his report is favorable his principals will immediately begin prospecting operations and push them with all possible rapidity.

San Diego.

HIGH PEAK.—*Julian Sentinel*, Aug. 17: The High Peak mine is again in a presentable shape. The dirt which caved in at the mouth of the tunnel has all been cleared away and new timbers put in, and ore showing free gold is now being taken out. The ledge in this mine varies from 16 to 33 inches in width, and is considered the best in the camp.

MAGAZINE.—The work of sinking the shaft at the Magazine mine was resumed Tuesday morning. The shaft is at present about 23 feet deep, and when a depth of 30 feet is attained, a drift will be run to the ledge.

Shasta.

LOWER SPRINGS MINES.—*Cor. Redding Free Press*, Aug. 18: It is every miner's duty to advertise the mines of his district, the same as any other legitimate business. There are as good surface croppings in our camp as can be found anywhere; this we know by our surface scratching. If our ledges are rich in gold quartz on the surface, they must be also rich as they descend into the earth, or in other words, as far as the gold solution extends. All our fissure veins here have characteristic features of some of the richest mines in California. All the surroundings point to some very rich gold mines, but our present generation will not find them unless capital comes to their relief. The best mine we have here is now lying idle. What for? Not for the want of capital, nor for the want of good ore or water to run the mine. What for? It is to be hoped that this company will soon resume operations and prove a great bonanza; by this means giving a new impetus to mining in this old district.

MAMMOTH.—*Courier*, Aug. 18: Frank Panter was in town Wednesday, and says the lower tunnel run in 150 feet below the old one to tap the great Mammoth lode, is now in about 200 feet, and 35 feet in good quartz. How wide the ledge will prove to be when cut through can now only be guessed at. Enough is already disclosed and known to prove that the Mammoth is one of the most extensive and valuable ore bodies in the State. The mine and quartz shows for itself, and the stacks of 320 pieces which the rock brings when reduced are witnesses whose evidence cannot be impeached.

SOME RICH ORE.—*Sacramento Record-Union*, Aug. 19: Under Sheriff B. N. Bugbey has returned from the Little Nellie mine which he purchased lately, bringing with him a large quantity of ore which was taken from a four-foot ledge on which his men are now at work. He says that specimens of rock were taken in a single strip across the vein, showing that he has struck a very fine body of ore. It works easy and the assays which have been made show it to be exceedingly rich. There is a fine water-power at the mine.

Siskiyou.

STRIKE.—*Yreka Journal*, Aug. 22: We learn that the richest strike in quartz yet found in this section was made last week by a prospector named Big Tom, who has been at work lately for the Hamilton boys. His rich find is on the north fork of Humbug, below the site of the old Eliza mill, the quartz being so thick with gold that it is very difficult to pull it apart after smashing the rock. The finder sleeps on the ledge to prevent parties from taking off any of the gold belonging to him. This is the fourth rich ledge found on Humbug this season, one by Simmons, another by the Hamilton boys, and another by Aldrich and Woods. The ledge of the Hegler boys and Bruce Aldrich is also turning out very rich, with plenty of quartz to keep their mill running steadily. The Humbug creek hills are full of prospectors, and much excitement prevails in reference to the rich finds lately discovered all over the Humbug district, including Klamath river on the north and the Deadwood creek section on the south.

Trinity.

EAST FORK MINES.—*Cor. Trinity Journal*, Aug. 18: The town of North Fork is lively. Many prospectors are coming and going, and you can hear the ring of the anvil, early and late, forging mining tools for the East Fork gold-seekers. A look at the Ozark mine on Rich gulch, East Fork, owned by John Day, discloses the fact that it is on a paying basis. Mr. Day has a force of men engaged in taking out ore, and the arastra is kept running day and night on \$125 rock. At a depth of 90 feet the ledge is 18 inches wide and is rich in free gold and sulphurets. The mines owned and controlled by Capt. Truworthy, known as the Orland, Fountain Head, Grizzly, Bell, and others, are looking well.

The captain has a force of men at work on each of the mines, and the more work is done the better the ledges develop.

THE THANKSGIVING MINE. owned by Bergin & Co., is being worked and good ore taken out. There are several tunnels run on this mine, the lead has been struck in all of them, and the ore proved to be of good quality. Barney gulch, tributary of East Fork, furnishes a sufficient supply of water to run a 100-stamp mill through the entire year. Work on the Enterprise mine is going on steadily with good results from the rock crushed. The arastra is kept running constantly, and ore is being piled up on the dump in large quantities. The Lone Jack, Poor Man, North Star, Crown Point and other locations too numerous to mention, lying around the Enterprise, and prospecting from \$20 to \$500, are not being worked at present for want of capital with which to properly develop them. W. T. Coleman, one mile above this group, has a fine and well-developed ledge ranging from 4 to 12 feet in width. Joe Watrous and Smith, the only placer miners on the creek, are patiently waiting for rain. The Davis brothers have made a new discovery on the Yellow Jacket. They have struck a fine lead of gold-bearing quartz three feet wide which prospects from wall to wall and will go about \$75 to the ton in free gold. The sulphurets are very rich in both gold and silver. They are now running a tunnel to tap the ledge. Still farther up the creek John Day has discovered a lead of quartz varying from 6 to 14 feet in width, and it can be traced for 700 feet by the croppings. It prospects at least \$35 per ton. The Mammoth, discovered by James Haley, lies between the Yellow Jacket and East Branch. The ledge is from 8 to 24 feet in width and prospects \$25 per ton.

Tuolumne.

QUARTZ.—*Sonora Democrat*, Aug. 18: Messrs. Allen & Shore are doing well in their pocket mine at Blue gulch. The Soulsby mill at Soulsbyville is crushing quartz from the Laura mine. This is a small lode, but the ore is rich in free gold and sulphurets. Allen Orcutt and partner at Blue gulch took out several hundred dollars lately. Chris. Drescher and Elias Dunaway have struck it big down at Blue gulch. Two weeks ago they had taken out over \$3000. They are still doing well. The Dickson Ranch mine (the Lane mine) has attained considerable depth; therefore it was found necessary to put a pump in. This week a Cornish pump was placed in the shaft. In a short time now if the lode continues its present developments, Mr. Lane will erect a ten-stamp mill. The Donella mine, situated near the North Fork of the Tuolumne river near Summerville, has passed into the hands of a St. Louis company of large means. The Black Oak mine is doing well and the work of development goes steadily on. The water reached the mill Thursday. The mill is now practically proof against all natural conditions that may tend to stop operations. Should the water fail in the fall, steam will run it as heretofore. The hoisting works will soon be in operation. They also will be run by water-power. Mr. W. G. Scott reports that the main chute is 300 feet in length and will average 3½ feet in width. A cleanup was recently made, and we are told that it was highly satisfactory.

TO START UP.—*Tuolumne Independent*, Aug. 18: The Bonanza will soon start up again under a long lease. A new 16-horse power engine has been purchased, and it is proposed to work the famous old mine for all it is worth. Messrs. Oliver, Johnson, Dart, Harriman and others are said to be the lessees. This has been the richest pocket mine ever discovered in the world, and there is no doubt but what she still has plenty of pockets around her old clothes, with plenty of money in them.

DISCOVERY.—Mr. S. H. Teeters has discovered a ledge of rock near the old Teeters mine, a short distance from Sugar Pine, that promises rich yields. As it is, every pound of rock taken out was worth two bits, while it continues to get richer, and the vein larger, with every foot of development.

NEVADA.

Washoe District.

CONFIDENCE.—*Virginia Enterprise*, Aug. 18: General repairs throughout the mine are still going on. Are shipping daily to the Brunswick mill for reduction 160 tons of ore, the average battery samples of which show a value of \$26.41 per ton.

HALE AND NORCROSS.—During the week have extracted 638 tons of ore from the 600 and 700 levels, and have shipped to the Nevada mill 615 tons. The average of the battery samples was \$42 per ton. All the stopes continue to look very well. The west drift from the 500-foot station has been advanced 55 feet. We have men on repairs in the main shaft and prospecting on several levels of the mine. We have bullion on hand and previously shipped amounting to \$36,000.

GOULO & CURRY.—*El Dorado tunnel*: The south drift from west crosscut No. 2 has been extended 23 feet. Face is still in good milling ore. The upraise 45 feet south of No. 2 crosscut has been carried up 17 feet; total height, 52 feet. The top is in quartz with streaks of good milling ore. During the week there has been extracted from the 250 and 300 levels and shipped to the Douglass mill 150 tons of ore, the average battery assay of which was \$29.25 per ton.

ALTA.—Extracting the usual quantity of ore from the 825 level, and the mill machinery is running smoothly. The Keystone machinery is also running well, and sinking to crosscut with the upraise from the 695 level has been resumed. Are opening a new station in the Alta and running a drift to the west to cut the vein on the 725 level.

CHOLLAR.—The north drift from the 650 level has been advanced 22 feet during the week; total length, 300 feet. The character of the ground is the same as last reported, being a mixture of quartz, clay and porphyry, with occasional bunches carrying some metal.

SAVAGE.—Owing to a lack of milling facilities shipments of ore from the Savage mine have been discontinued, and no stopping is being done in the mine. They are now making necessary repairs to the vertical shaft.

CROWN POINT.—The south drift from the 700 crosscut is in 27 feet in a mixture of clay and porphyry, with a little quartz exposed on the west side.

BELCHER.—The 500 crosscut is now 261 feet in. No change in the ground since last report. Have now drained and cleaned out the 850-foot station

and are engaged in putting in guides in the middle compartment.

ANDES.—From the west drift on the 350 level are now going north in a streak that looks promising, yielding a little ore. Are going south on the 240 level from the west crosscut on a streak that is looking well.

BENTON.—Continuing the drift on the 700 level and cleaning out the 800 level drift, preparatory to the resumption of explorations on that level.

OCCIDENTAL.—Extracted 103 tons of ore, and shipped to the mill 125 tons, the average assay of wagon samples being \$28 per ton.

POTOMAC.—The south winze on the 550 level has been sunk 15 feet the past week; total depth, 43 feet. This winze is all in low-grade quartz.

WEST YELLOW JACKET.—Expect to make a connection early next week; this will give good air and expose a seam of high-grade ore.

CHALLENGE CON.—General repairs throughout the mine and prospecting work on the 100 level are going on.

CONSOLIDATED IMPERIAL.—Repairs to the main north lateral drift on the 1100 level are still going on.

JUSTICE.—Are hoisting about 15 tons daily, and have about 2500 tons of milling ore on the dump.

BULLION.—Are drifting south on the 640 level and crosscutting east on the 500 level.

BALTIMORE.—Are crosscutting in the ledge on the 338 level.

Hawthorne District.

LAPANTA ORE.—*Esmeralda News*, Aug. 18: One hundred and sixty-five tons of Lapanta ore were crushed at the Kinkead mill last week, from which was produced a bar of gold bullion valued at a little over \$10,300. In most mining districts ore working \$53 per ton would be considered high grade, but here in Hawthorne mining district, where ore worth from \$550 to \$3000 per ton is being extracted daily, that class of ore is termed second or low grade. The 165 tons of Lapanta ore spoken of was the last of the lessee's work, and the high and low grade was mixed as a final cleanup.

A GENERAL COMPLAINT.—As a matter of course, whenever a prospector comes in from the mines he is asked how his prospects are looking and whether he has any ore out; the answer received in nine cases out of ten is that he has considerable low-grade ore on the dump, but that on account of the exorbitant expense connected with hauling and working the same he can do nothing with it. What a benefit reduction works would be to these hard-working men if erected in this vicinity. As it is at present, ore that will not work over \$35 per ton is of no use to the prospector, for after paying for hauling the same from their mines to the railroad depot, thence to the reduction works at Dayton or Reno, the charge of working it and the discount on bullion, there is nothing at all left to pay him for the labor and money expended in extracting the ore. There are no better advantages for investment offered than in the erection of suitable reduction works to work the ores of Hawthorne and adjoining districts.

Lodi District.

SHIPPING ORE.—*Belmont Courier*, Aug. 18: Alfred Welsh is making regular shipments of high-grade ore from the Illinois mine to the Selby Smelting Works, S. F., for treatment.

San Antonio District.

LEACHING.—*Belmont Courier*, Aug. 18: A. B. Eastwood is running his leaching works on ore from the New Year mine with but indifferent success. The ores of this mine will have to be roasted before they will leach properly.

Tuscarora District.

DEL MONTE.—*Times Review*, Aug. 17: No. 1 winze from tunnel level has been sunk 23 feet. The vein is large and regular and there is an improvement in the grade of ore.

COMMONWEALTH.—100-foot level: No. 2 south drift from east crosscut has been advanced eight feet, the face showing three feet of good ore. The crosscut started from the main south drift 130 feet south of the shaft has been stopped. 150-foot level: North drift from No. 1 east crosscut has been advanced 13 feet without change, and No. 1 north drift from west crosscut has been extended 20 feet in very favorable formation. A crosscut has been started from main south drift 130 feet south of the shaft, to open up the ore found in the 100 foot level directly above. This crosscut has been advanced 17 feet. No. 1 winze has been sunk 14 feet; total, 81 feet. The ore is high grade and exposed five feet wide; it is still wider, but the winze did not take the full width. The east lateral has been extended 14 feet, with fine ore still in the face. Very high grade has been extracted in driving this drift.

NEVADA QUEEN.—Average assay from the battery pulp for the last week, \$209 per ton. The usual progress has been made in 450-foot level, the vein widening but not so high grade. Two hundred and sixty tons concentrating ore have been hoisted during the week. Average assays taken from car samples, \$26.39 per ton. Bullion shipped, \$8,116.25. Mill running all right and doing good work.

NAVAJO.—North drift from No. 2 winze on east vein, 250-foot level, has been extended 10 feet. The vein shows a fair width of high-grade ore. South drift on west vein, 150-foot level, extended 10 feet. The stopes above the 350-foot level are opening out well in both grade and quantity of ore.

GRAND PRIZE.—Stopes above the 200-foot level show a large vein of ore, but of lower grade than heretofore. The 300-foot level stopes are yielding a good grade of milling ore. The mill is running all right.

NORTH BELLE ISLE.—The workings in the south stopes, 300-foot level, are yielding the usual amount of high-grade ore. Good progress is being made with the work on the concentrating plant.

FOUND TREASURE.—The water has been lowered to within five feet of the top of the 200-foot station.

BELLE ISLE.—The stopes above the 250-foot level are yielding the usual amount and grade of ore.

Willow Creek District

LOOKING WELL.—*Silver State*, Aug. 16: Vance Nelson, who has been prospecting in the Willow creek mines lately, reports that McKenzie & Wilson's mine is looking well and they have a car-load of ore ready for shipment. Professor Thompson has a force of men working on his new mill, but the water in the creek is so low they will not be able to run it before late in the fall.

ARIZONA.

VARIOUS CAMPS.—*Prescott Courier*, Aug. 16: Mr. Williams, superintendent of Copper Basin, is, we learn, fixing foundation for smelting works. In digging for the same, the workmen struck ore that assayed 30 per cent copper. This is at least what we have heard. A mining man who recently visited the Basin says it is a wonderful place. A great depression in the mountains filled with deposits of copper; indeed copper ore is found almost everywhere in the Basin and surrounding hills. Fluxes are, however, said to be scarce, but prospectors will undoubtedly find them. The Basin is about 13 miles from Prescott, just across the Skull valley divide. Wm. Dulin and partner have a water-wheel and plenty of water to run it in Walker district. They have, too, a pretty good-sized vein of rock that assays about \$116 per ton in gold. They will arastra the richest of it and ship second-class. Henry Dupre has just shipped several tons of very rich silver ore from his mine, which is near Cordes station, on the Prescott and Phoenix road. Douglas Gray from lower Big Bug tells of profitable mining. We have cheering news from Walker district. The Amulet mine continues to produce ore that pays well to ship. Mr. Moore is now sole owner. G. G. Henderson arrived at the ore works recently, with a wagon-load of good silver ore. He says that John F. Blandy is working his mine with six men and that it is a fine mine. N. L. Griffin is shipping ore to Van Name's mill. H. M. Hughes has put men at work on the Ground Hog and Wedge mines. He recently visited Upper Big Bug and praises Van Name's mill. His son-in-law, Robt. Cartnell, has a force of men working the Sterling and is getting plenty of ore that assays \$128 per ton in gold. Riggs & Lawler are making regular shipments of the very richest kind of silver ore from their Hillsdale mine. The ore is hauled over 100 miles in wagons. Mr. Thompson, superintendent of the United Verde copper mines, and Ed Austin have been examining mines in Hassayampa district, and saw a great deal of rich ore in Bigelow and Smith's camps, at Dan Hat's and elsewhere. There is in this section a company of Italians who are making money fast, arastrating gold rock. The heavy rains will enable placer miners to start their sluices, and the *Courier* is not afraid to say that the fall mining season in this part of Arizona will be the most satisfactory of any we have had in the past decade. F. M. Murphy, the energetic superintendent of the Congress mine, is working a large force of miners and making regular shipments of rich sulphurets. Heavy shipments of copper-silver bullion are almost every day being made from the United Verde smelters. Mr. Kelly brought in yesterday a wagon-load of ore from the Blue Dick mine, Hassayampa district, and stated that a 15-ton shipment will soon be made. Dos Oris, in same camp, is producing rich silver ore.

MOHAVE MINES.—*Miner*, Aug. 18: There is a lot of ore from the Sunlight mine on the ore platform, which will be shipped to Pueblo, Colorado. Messrs. Morrissey & Winston have given up their lease on the Oro Plata. The ore is of too low grade for profitable working. The ore streak in the raise in the Night Hawk is improving and every miner who looks at it is satisfied that it is a very rich body of silver ore. John K. Mackenzie has started the pumps on the Cupel and will clear the lower levels of water. Fourteen men are now at work on the mine and ore shipments will soon be resumed. The outlook for Stockton Hill was never better. Judge J. M. Murphy and his force of workmen returned from the McCracken mine on Saturday last. The mine opened out better than was expected and samples taken from it assayed as high as 300 ounces. The McCracken is known as a low-grade property.

COLORADO.

THE SAN JUAN COUNTRY.—*Silverton Miner*, Aug. 14: The Columbia is indulging in regular shipments. Wm. Maroney, Abe Appel & Co. are working the Green Mountain mine on a three-year lease. The Gray Eagle will soon be ready for a large output. Drifts are being run on the ore body and stopes opened up. The Sailor Boy is being worked this summer by the owners. They have also located a claim farther down the gulch and getting some fine-looking ore therefrom. The Mountain Queen is in ore, low grade at present, but it is thought a rich streak will be found near the hanging wall. The Whale stamp-mill is completed, with the exception of a few finishing details, and will be started up between the first and last of next week. Alonzo Smith, a practical millman, is in charge, which insures success. George Gilton has a force of men working the Ready Cash mine in Cunningham gulch. A fine grade of ore is being taken out. Gladstone is receiving another gold boom and prospectors are scouring the hills in search of quartz. The west side of the south fork of Cement is receiving especial attention, and some very flattering finds have been already made. The Dives mine was sold last Saturday by Mrs. M. E. Ingersoll to Theo. Benovsky and M. V. B. Wason for \$4000 in cold cash. The mine is in Arastra basin; has a very large body of lead ore in sight.

CRESTED BUTTE.—*Elk Mountain Pilot*, Aug. 18: We can notice an appreciable improvement in mining for this vicinity. Work at first seemed slow starting up this season, but now that the season is advancing, the work is increasing, and aside from mere assessment work, many prospect-owners are letting contracts for 50 and 100 feet of development. While there is not as much work being done in some directions as we would like to see, still what is being done is proving satisfactory to the mine-owner. The Hawkeye Mining Co. is very anxious to build a concentrator at Pittsburg. We would suggest that they go to work in the mine and produce some ore before they undertake to build a mill. It is the utmost folly to build a mill before there is any ore produced. The Augusta mine needs a concentrator, because it has dump ore the accumulation of several years' work. Not so with the Hawkeye, because there is no ore produced. Creller, Carey & Bradbury are working the Grasshopper and taking out some of the most solid copper pyrites to be seen in the country. Miller, Jones & Houser are working their claim near by and sacking copper and galena ore as fast as they can shoot it down. Millrun tests show 25 ounces silver, three-tenths ounces gold, 14 1/2 per cent copper.

CONCENTRATING AT LEADVILLE.—*Mining and Scientific Review*, Aug. 16: A new concentrator is being erected on the Wolfstone mine at Leadville,

its capacity is to be 200 tons every 24 hours, and when completed will be one of the largest concentrating plants in the State. There is an immense dump of low-grade ore on the mine. It seems to us that this is to be the solution of a great problem, not only in Leadville but in all the great mining districts, especially the San Juan country and all others remote from markets. A very large proportion of the gross product must necessarily remain in camp because the grade is too low to bear the cost of transportation over the mountains. But by concentrating, the product can be shipped and yield material profit. The dumps of every district that have been effectively worked for a term of years contain vast sums of money, and there is no way to reach it except by washing out the worthless material. The conversion of six, eight or ten tons of crude ore into a single ton will supply new sources of wealth.

DAKOTA.

A SUCCESS.—*Deadwood Pioneer*, Aug. 16: The Merritt-Bullion smelter appears to be an unqualified success. Dan Brown, in Iron Galena yesterday, reports that when he left at eight in the morning, some 27 bars, a little more than one ton of bullion, had been run out. No further advices were received during the day, but as everything was working smoothly, indications are that the fortune of the enterprise is no longer a question of doubt. John Baker goes over to-day, and will probably be able to furnish a fuller report upon his return this afternoon.

FLOAT.—Little or nothing new can be reported of the Deadwood Reduction Works. A large force of men is still employed on the road, which is rapidly nearing completion. Work on the walls likewise progresses most favorably. John McVean and Dave Short came down from Ruby Hill yesterday. Recent developments have been flattering. A solid body of pay ore, of unknown dimensions, has been struck in the shaft. It will be followed, and if holding out as it promises, will shortly turn a flattering prospect into a paying mine. Good ore has been struck in the Double Standard, adjacent to the Tornado, Bald mountain. The stock is tightly held and in strong demand. Report of a remarkably rich strike in the Monarch reached Deadwood yesterday afternoon. The ore was described as free milling, and so filled with gold that small nuggets could be picked out with a penknife. Corroboration is awaited with more than ordinary interest.

IDAHO.

CENTERVILLE.—*Cor. Idaho World*, Aug. 17: If you want to see a booming little mining camp you must take a trip up Elk creek as far as the Elkhorn mine. Everybody busy and a vast amount of work is being done there. Hugh Turner will have his mill ready for crushing in three or four days. He has 12 men employed. Sweet, Williams & Smith, owners of the Gladstone, have their tunnel in 170 feet. The Oro Fino, owned by Mitchell, Bano and Naz Carpenter, is a very promising mine. Main tunnel in 325 feet and a vein of 25 or 30 feet more will tip the old Oro Fino vein at a depth of 150 feet. A raise from main tunnel to old works—85 feet—cuts through a body of talc and quartz seams 20 feet wide, which it runs through a mill would pay a handsome monthly dividend.

TUNNEL.—*Owyhee Avalanche*, Aug. 16: We hear that work has been commenced on the Bell Beck tunnel by the order of J. H. Brotherton, and that it will be continued until the same shall have been extended into and through the Poorman ground. The tunnel will strike the Poorman lode probably 600 feet deep, and will be used to run ore and waste dirt through as well as a drainage for the mine. It is not known just how far it will have to be run to accomplish the purpose above named, but not far. From this tunnel all the mines in the Poorman group will be worked at considerable depth. This is a move in the right direction and indicates the mining sagacity of the manager.

NEW MEXICO.

DEVELOPMENT WORK.—*Silver City Enterprise*, Aug. 17: A body of carbonates 12 feet thick has been found in the Big Hatchet mountains. The ores assay 12 ounces in silver. Water has been taken out of the Santa Rita mine to a depth of 240 feet, and Franklin Mahon secured a large pump last week, with which he expects to drain the mine dry in about four weeks. This valuable property will be put in shape to receive the benefit of the recent rise in copper. Arrangements have been made by the Deep Down Mining Co. with Peter Wagner for the surplus water made in his shaft—said to be about 40,000 gallons daily—giving them sufficient, with their present supply, to run the mill on full time. The extent of the ore chute has not been determined, but it would not take many tons of it to pay a good dividend. There is an abundance of low and medium grade ore to keep the mill constantly running.

MONTANA.

SMEITER IMPROVEMENTS.—*Anaconda Review*, Aug. 18: The Anaconda Co. has in contemplation the running of a tunnel 700 feet immediately north of the old works and on an incline up the hill 600 feet higher. The tunnel is to be 16x14 feet in dimensions, and its object is to take the smoke and fumes so far up the hill that they will not come down to the works at all. The plan works most successfully at the lower works, and when it has been carried out above, Anaconda will be perfectly free from smoke. The new boiler-house has been completed, and the new iron smokestack, seven feet in diameter and 200 feet high, has also been completed.

GRANITE.—*Phillipsburg Mail*, Aug. 18: There is but little news to report this week, other than since the shutdown and cleanup last week the regular output has been resumed, and the old reliable looms up with the following product for the week: The output for the week ending Aug. 15th was 35 bars of bullion, containing 60,877.90 ounces silver and 27.54 ounces gold.

SAN FRANCISCO.—In an interview with Mr. Kennett, president of the Sao Francisco, he expresses himself as being thoroughly satisfied with the outlook of the mine. Mr. Smith's reports have been perfect and everything is very satisfactory. They have laid off some of the men for the reason that

they cannot work to advantage in upper levels just now, as they are satisfied what their mine is, and that the ore can be taken out when desired, but it is poor policy to take it out and leave it on the dump. He says, however, that by next summer their mill will be completed, the site for which is just outside town limits, and they will develop a mine equal to any in the country. There will be no shutdown of the mine and no more men laid off.

BI-METALLIC.—Work at the mine is going ahead with great rapidity. They now have two pumps in operation and expect in another week to reach the big pump at the 500-foot level. Most of the lumber for the construction of the new hoisting-works is now on the ground and building will be commenced at once. Operations at the millsite are making the usual steady progress.

OREGON.

CRACKER CREEK MINES.—*Cor. Oregonian*, Aug. 16: Having just returned from the Cracker creek mines, I may be able to give some information regarding this section. The formation is principally of quartzite intersected with porphyry, with apparent surface condition favorable to rich and permanent ore deposits, and a thorough inspection of the Columbia and other mines now in process of development but confirms former reports of the merits of this mineral region. Over the divide from Cracker creek lies the late discovered district of Rock creek, and which is no doubt an extension of the Cracker creek belt. In this most promising region, yet in its infancy of development, I visited a large number of prospects in process of development, among which one in particular, the Forest City, deserves special mention by reason of its rich and well-defined showing and other characteristic features. The claim was discovered and located by J. P. Marlarkey, and the manner in which it is being developed reflects credit upon that thorough and efficient mining man. The Forest City has two distinct and well-defined veins, crossing at the surface with well-defined walls of quartzite and porphyry and contain exceedingly rich ore, predominating in gold, of which an assay has been returned from J. F. Cresmon, assayer of Baker City, yielding \$10,729 per ton. A contract was let by Mr. Marlarkey, and men are now at work in excavation, with the calculation of cutting the veins at a depth of 200 and 300 feet.

ROBINSONVILLE DISTRICT.—*Bedrock Democrat*, Aug. 16: The *Democrat* received a call yesterday from a gentleman who has spent the past month or two in examining the mines adjacent to the old placer-mining town of Robinsonville, about 45 miles southwest of Baker City, and from him we learn considerable of interest regarding operations at Greenhorn mountain and country tributary. Starting from Robinsonville, which is the center of this great mineral section, in any direction will be found locations of quartz, many of them undergoing extensive development and showing splendid indications. The more important section tributary is the Greenhorn mountain district, where considerable work has been done. The principal mines are the Vanderbilt, Jay Gould, Intrinsic, Invincible and Pride of Pendleton. An important sale of mines in this section occurred last week whereby 11 claims were disposed of to an Eastern syndicate for the sum of \$100,000. The Worley mine, owned by W. J. Wolfe of this city and J. Worley of Portland, is showing to be a valuable property. A small mill is crushing the ore and we learn that \$20 to the ton on an average is the yield. The Hagarty mine is being developed vigorously. The Red Man, J. H. Mitchell superintendent, is also giving great encouragement to the owners, and development work will be pushed during the fall and winter. A mill will probably be erected in the spring.

UTAH.

IN THE IRON RANGE.—*Cor. Salt Lake Tribune*, Aug. 18: I returned to camp last night from the Rio Virgin river, and learned from the miners that Messrs. Henry and Wilson have bonded the Decandia mine for \$4000 for 90 days. Some of Mr. Henry's assays of the Decandia ore run over \$800 to the ton. Mr. R. Young located a heavy ledge that assayed \$82. This is the first time this camp has looked like opening. There is plenty of room here for good prospectors, and with Mr. Henry in camp as an assayer, the camp will be tested for all that it is worth. Mr. Henry and Mr. Wilson went to Marysville for supplies and tools, and outfit to work on the Decandia and other claims now in their possession. There is but little doing in iron just now. There are 35 iron mines in the district, and we now say that they are mountains of iron. The Mount Baldy range and the Cave Mine range come in conjunction at this district.

WASHINGTON.

DISCOVERY OF PETROLEUM.—*Ellensburg Capital*, Aug. 16: It was reported yesterday that petroleum had been found in Winatchee valley, while prospecting for coal. The surface-water is covered with oil which readily ignites when a match is applied. With oil added to the other great resources of Kittitas county, there is nothing to prevent this from becoming the richest section of the Pacific Northwest in a very short time. With coal, iron, gold, silver and copper in abundance, now we have petroleum in addition.

OUR IRON ORE.—Mr. Cornthwait, manager of the Ellensburg Foundry & Engineering Co., informs the *Capital* that the machinery will be here in a few days ready to be placed in the new building. He thinks a test can be made of the ore from the Iron mountain mines, which can be shipped to Ellensburg in great abundance, as the mines are near the Northern Pacific railroad and of easy access.

RICH GOLD AND SILVER STRIKE.—Last spring, Mr. McDonald, while prospecting along the Similkameen, discovered some very promising float, which he traced to the ledge and located the Southside mine. The ledge was found to be very large and promising, and several locations were made on it beside the Southside. Little work was done on it, however, till last week, when a blast was put in, throwing out rock that assayed \$512 silver and \$20 gold, and exposed a fine body of ore. The owners of the Southside are delighted with their find, and will prosecute work on it quite extensively. They think they have one of the biggest and best mines in the country, and will demonstrate it in a short time,

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. O. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

'CHALLENGE,' 'STANFORD,' 'TULLOCK,' & 'ROLLER' FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent on application.

JOSHUA HENDY MACHINE WORKS, 39 to 51 Fremont St., San Francisco.

HOSKIN'S IMPROVED ONE-JOINTED HYDRAULIC MACHINE.

The statement of Mr. Joshua Hendy that any style of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleecing miners for royalty, is ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

THE LIXIVIATION OF SILVER ORES WITH HYPOSULPHITE SOLUTIONS

(With special reference to the Russell process),

BY C. A. STETEFELDT.

The only complete Treatise on the Chemistry and the Practice of the Lixiviation Process

Published and sold by the Author, 18 Broadway, New York.

Price \$5.00, Registered Postage Prepaid.

Remittance should only be made by Bank Draft, or by P. O. Money Order, payable to the order of C. A. STETEFELDT.

"De man wot knows it all is alluz a-makin change, a-buyn' ob experience." The man who does not think that he "knows it all" about Pumps can find out a great deal about them in *Grimshaw's PUMP CATECHISM*. By mail, postpaid, \$1. Dewey & Co., 220 Market St., S. F., Cal.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; is in successful operation and we guarantee its work as represented.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager,

461 Howard St., San Francisco.

HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

JAMES LEFFEL'S

Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

News in Brief.

The great reservoir at Sweetwater, San Diego county, is to be stocked with 10,000 young trout.

A few years ago San Luis Obispo county was awarming with sheep. Now there are but 1500 in the county.

It is rumored in Vienna that the Russian Government has contracted for a loan of \$3,000,000 in America.

SETH GREEN, N. Y. State Superintendent of Fisheries, and famous as a fish culturist, died on Monday last.

There will be an international horse show in Paris next year, where \$45,000 will be distributed in prizes.

The Japanese Government has decided to spend \$10,000,000 in five years for the purpose of purchasing men-of-war.

CONGRESSMAN SPRINGER says that in two weeks after the passage of the bill opening Oklahoma Territory 100,000 people will have settled in it.

The cannery on Puget Sound say they will not pay 17 cents each for fish, and a lively time is expected with the fishermen, who have fixed their price at 17 cents.

PHYSICIANS in charge of the hospital at Jacksonville, Fla., declare that all the deaths so far have been due entirely to the intemperate habits of the patients.

THE native pupils of the Industrial school at Sitka have an organized military company and are receiving instructions from Lieut. James A. Turner of the United States Naval Guard.

DR. PASTEUR at Paris read before the Academy of Sciences a letter from Dr. Gamaleia of Odessa announcing the discovery of cholera vaccine. The announcement was favorably received.

It is proposed in England to provide judges at race-tracks with an instantaneous photographing apparatus by which to tell beyond possibility of mistake what horse has won in a close finish.

THE late A. J. Palmer of San Diego was buried in the ocean on Saturday, in accordance with his directions. His remains were placed in a box, taken beyond Point Loma and sunk with heavy weights.

At Jacksonville, Fla., 500 negroes visited the city in hopes of receiving a share of the Relief Fund from the Government, and were amazed when told that they could draw nothing unless injured by the yellow fever.

BEFORE the Congressional Committee of Immigration William Blake, superintendent of Charities, testified that papers and idiots have been habitually sent to this country and that 70 per cent of the inmates of our almshouses are foreign.

THE old Santa Inez mission, which has stood the weather for a long term of years, will undergo repairs. The tile roof is to be carefully taken off, and all the old timbers removed and new ones put in their stead. The tilings will then be replaced as they were originally.

GEORGE GORDON of Big Valley, Shasta county, was driving with his family toward Cottonwood, when his team was attacked by a swarm of yellow-jackets. The horses ran away, the family was thrown out and more or less bruised, and one of the horses was stung to death.

THE joint statement of the Senate and House Appropriations Committees up to August 15th shows the grand total of appropriations to be \$428,269,520 55, an excess over last year of \$64,054,730.81. Since the 15th the Fortifications bill has been reduced two and a half millions, and it is probable \$3,000,000 more will be taken from the Army bill. This would make the probable surplus for the next fiscal year something over seventeen and a half millions.

FOR some time a considerable amount of telegraphing has been going on between J. D. Spreckels & Bros., agents of the Oceanic steamship Co., and Postmaster General Dickinson, and they received a semi-official assurance from Washington that the Postoffice Department would allow the company all sea and inland postage on mail sent from the United States to the Australian Colonies for the coming year for maintaining the service. This will amount to about \$50,000 annually. The Colonial Governments wished the United States Government to contribute one-third of the subsidy, or about \$65,000 annually.

Please Remit.

Too large a number of our subscribers are in arrears on this paper. Now that we have been a little overkind to such, there is the stronger reason that they should make an extra effort to remit the amount due us for subscription without further delay. We have been very earnest and sincere in presenting a paper to each and every one of our subscribers well worth the price asked for it when paid in advance, and in justice to ourselves we must now insist upon all subscribers in arrears paying up. While to each individual the amount is small, collectively it is large to us, and we are obliged to urge settlement.

A NEW PAPER BINDER—A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, and very cheapest of all economical and practical file binders. Newspapers are quickly placed in it (as received) and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price (size of this paper, Harper's Weekly, and Scientific American), 75 cents; postage 10 cents. Postpaid to purchasers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

**GREAT REDUCTION!
BATTERY SCREENS.**

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates. I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot-Cut burred and Slot Punched Screens. Mining Screens a specialty, from No. 1 to 15 (fine). Orders promptly attended to.

**San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.**

THE PELTON WATER WHEEL

Gives the highest efficiency of any Wheel in the world and is everywhere recognized as the standard for high pressure service.

UPWARDS OF 500 IN USE.

From 12 to 30 per cent better results guaranteed than can be produced from any other Wheel in the country. It is not only most economical of water, but the most ample and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Tram cars, etc. Address

**The Pelton Water Wheel Co.,
127 FIRST ST., SAN FRANCISCO, CAL.**

**Practical Treatise on Hydraulic Mining.
By AUG. J. BOWIE, JR.**

This new and important book is on the new and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdy, rockers, undercurrents, etc.; also describes methods of blasting, tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

THE RAND DRILL COMPANY,
23 Park Place, New York.

We are now so situated with our new works as to offer to the miners of the Pacific Coast SMALL AIR-COMPRESSING PLANTS at such prices that almost any small mine can afford to put in power drills if they have none in use.

By our NEW AND PATENTED SYSTEMS (by which the duty or performance of drills is not reduced with use) it is no longer necessary

PLANTS IN THIS COUNTRY, and has patterns for all sizes up to 40-inch diameter of cylinder. In respect to capacity INSIDE OF DRILLING, perhaps it is in order to say that in EVERY AUTHENTIC TEST for speed yet initiated, the RAND DRILLS have, without exception, BEEN VICTORIOUS. This fact coupled with another important one, that the drills use much LESS AIR and cause LESS REPAIRS, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained us from the California market no longer exist, we are now in the field for two business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor built for the Anaconda mine in Montana.

ROCK DRILLS
AIR COMPRESSORS &
GENERAL MACHINERY FOR
MINING, TUNNELING,
QUARRY & RAILROAD WORK
RAND DRILL CO 23 PARK PLACE NEW YORK

to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having THE NEWEST AND LIGHTEST designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the LARGEST COMPRESSOR

of cylinder.

THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

The "Kriebel" Stationary and Marine Engines.

In the Industrial Exposition of the Mechanics' Institute, now being held at the pavilion, we were pleased to note in the exhibit of machinery made by the Joshua Hendy Machine Works of No. 51 Fremont street, this city, a stationary and marine or boat engine denominated the "Kriebel." These engines, as will be observed by an examination of the cuts herewith presented, differ from those of the slide-valve pattern, inasmuch as the "Kriebel" have a moving or vibrating cylinder and stationary valve instead of a stationary cylinder and moving valve. By this arrangement of parts the eccentric valve-rod, cross head and connecting-rod found in slide-valve engines are dispensed with, the construction of the engine greatly simplified and the friction of movement reduced to a minimum. There are fewer working parts and are therefore durable and easily attended.

The framework of these engines is cast in one piece and is well proportioned in design and strongly built, thereby preventing the working parts from drawing out of line.

The cylinder trunnions and steel crank-shaft are held in position by strong boxes, lined with the best brass babbitt metal. The piston-rod is made of steel. The adjustable crank-box and mortised in and bolted to an iron body or box into which the end of the piston-rod is screwed and securely fastened by a steel pin. The cylinder is bored out perfectly true and the piston carefully fitted. The piston has three rings supported by springs and can be readily expanded. The cylinder is incased by a Russian iron jacket bound by brass bands, and the space between the cylinder and its jacket is filled with asbestos lagging.

The Kriebel marine or reversing engine possesses the advantages of compactness, light weight, great strength, slight friction, high speed and extreme simplicity. In addition to all of these, they are provided with an ingeniously contrived reversing device that is far more simple, acts more quickly and is much more easy to handle or manage than the link motion, adopted on other styles designed and intended for the performance of similar marine, boat or other service.

These engines are constructed upon the same principle and in the same manner as the stationary engine first above described, but in place of a governor they have a reversing arrangement. This consists of a cup-shaped valve

attached to a lever and inclosed by a casing. The steam pipe of the engine is screwed into the top of the casing and the exhaust pipe into the side. The movement of the reversing lever from side to side changes the course of the steam from the center-valve port to the two side-valve ports, and vice versa. This reverses the engine or causes the crank to move in the opposite direction. The reversing valve also answers the purpose of a throttle, as by moving

it an investigation of the merits of these marine or reversing engines will prove advantageous and pleasurable.

SOME time since it was learned that there existed in Mill Creek canyon, San Bernardino county, an excellent article of sandstone suitable for building purposes. Small parties at once located quarries, but none of them were pushed to a successful issue save one, which

Red Chief Gold Mine.

We had a conversation this week with a gentleman who is familiar with the Red Chief gold mine. This mine is on Kanska creek, which is four miles from Forest City and on the road from Nevada City to Forest City. This is a very large property having three veins, one of which is 80, one 25 and one about 50 feet in width. It is in length more than a full claim.

The company owning this property was organized in New York and came into possession of the mine about a year since. Sufficient money has been placed in the treasury to build the mill, purchase all the appliances and open the mine properly. There is plenty of timber near by, and the company claims the waters of Kanaka creek. A dam has been made in the river and a flume and road built. They have a sawmill in operation, and are now logging, bringing in the lumber and the timber for the mill.

They have the machinery for a 40-stamp mill all on the ground, and are putting it up with a full force of men. Until now there never had been a mill on the property. Several tunnels have been run and they are able to make a very large showing of ore.

The ore is free-milling, the sulphur and iron being decomposed. They expect to crush four tons to a stamp, the ore is easily worked; the batteries are all double discharge. Most of the gold in the ore is shot gold. The managing director is F. H. Hauman, whose

office is in the Safe Deposit building in this city; the superintendent is L. J. Lewis. The mill will run by water-power, a 23-inch Leffel turbine being used. It is expected that the mill will be entirely completed by the 1st of October.

WHEN the whites first went into that region all the Palmyra mountains, Como district, Nev., were covered with a splendid grove of nut-pine trees. It was the grand nut-pine orchard of the Pintes. The red children of the wild loved this grove of pines, and when the white men came into it with their axes old Capt. Truckee, with tears in his eyes, protested against its destruction. It was swept away, however, and even the tree stumps were dug up and hauled away. It is said that a sparse growth of young pines is now springing up all over these mountains. As the nut-pine is native to the soil and flourishes without artificial irrigation, this sort of growth should be encouraged in all parts of the country if the mountain-tops are ever to be covered with rain-attracting foliage.

"KRIEBEL" STATIONARY AND MARINE ENGINES.

the lever to a central position the steam and exhaust ports are closed and the engine stopped. These marine engines are also provided with an adjustable thrust or push bearing, which is so attached to the engine bed as to relieve the crank-shaft from all longitudinal strain.

By reason of the substantial, simple and perfect construction of either the stationary or marine form of these "Kriebel" engines, an inexperienced person can readily learn to operate them, and, for the same reason, an experienced engineer can run one with less attendance and expense than is required with engines of other styles. The only part that requires repacking, and that will seldom occur, being the brass stuffing-box for the piston-rod.

The simplicity of construction and economy of use and space, secured by the adoption of these engines, naturally suggests a critical examination of their operation at the Mechanics' Exposition, as they seem to us to be eminently adapted for use where small powers are required, and to those who are interested in boating and take pleasure in yachting, we be-

lieve an investigation of the merits of these marine or reversing engines will prove advantageous and pleasurable.

was under the management of Mr. H. C. Cahle. This gentleman at once put a large force of men at work getting out building stone, and then went to work getting contracts. He succeeded in getting orders for two buildings in Redlands and for several in Los Angeles. Up to the present time the work has been confined to getting out the Redlands rock. A joint-stock company has been formed, with a capital of \$50,000, to work this quarry, and it is their intention to put in a complete set of machinery and have the stone all dressed at the mine before delivery.

At present there are eight large lime-kilns perpetually burning in the Mojave valley, about 50 miles north of San Bernardino. Each has a capacity of 500 barrels of lime per day. The Oro Grande lime has supplanted Eastern lime, and is now sold in San Diego, Los Angeles, San Bernardino, Pasadena, Santa Ana and Escondido. Mr. Wyman has expended about \$40,000 in developing the lime business of Oro Grande.

The Russell Process.

Its Practical Application and Economic Results.

(Continued from our last.)

6. *Precipitation of the Silver from the First Wash-Water.*—Besides the method of precipitating by means of acid and old iron, the silver may be also precipitated from the first wash-water by means of sodium sulphide, or sometimes by dilution. The method by sodium sulphide is probably the better for Mexico of the first two, and is quicker, as the precipitation of the silver by iron requires about 12 hours, and heating of the wash-water in the precipitating-tanks. The average value of the various precipitates from different ores by the two methods would probably not differ much. But the method by acid and iron seems to be the most thorough, except when the wash-water contains such a very small amount of base metals, that (as at Yedras) all the base metals can be economically precipitated along with the silver. This very rarely happens. In most cases, when sodium sulphide is used, only enough is added to precipitate all the silver and part of the copper, without precipitating much of the remaining metals; but sometimes a small amount of silver remains unprecipitated. A point in favor of the method by acid and iron is, the extremely small bulk of the precipitate compared with that produced by sodium sulphide. This method consists in suspending old iron in the wash-water tanks and heating the water to about 175° F. (more or less), after acidifying it with 1 to 2 pounds of acid per ton of ore. The method of "dilution" consists in simply diluting the wash-water with sufficient pure water to precipitate the chloride of silver. It is not a safe method, however, for some ores, and it requires considerable water.

7. *Value of the Precipitates from the First Wash-Water.*—Table XVII gives the value of the precipitates, by both methods, from the wash-water of various roasted ores. The value of the precipitate of either method depends mostly upon the amount of copper present in the first wash-water, as it is practically impossible to avoid precipitating copper by either method. As a rule, the precipitate from ores with an alkaline wash-water is much the higher in value per ton.

b. *The Second Wash-Water and Mode of Using it.*—The volume of the second wash-water per ton for raw ores is always the same as the volume required to saturate the wet charges. It is used to restore the volume of the stock-solution, which would otherwise be diminished, for each charge treated, by an amount equal to the stock-solution remaining in the ore when the charge is drained. This amount is about 5½ cubic feet per ton of ore. For raw ores there are two methods of applying the second wash-water. In the first the ordinary solution is left standing level with the surface of the charge, the outlet of the leaching-tank being stopped. A measured number of inches of water, equal to the amount required to saturate the wet charge, is then run upon the charge. The outlet of the leaching-tank is then opened and the leaching continues until the water is at the surface of the charge. The water remaining in the charge is then allowed to run to waste, but not into the precipitating tanks for the leaching-solutions. By the second method employed, if water is scarce and must be economically used, the leaching-solution is allowed to drain out of the charge, and is then followed by water to the extent of about 5½ cubic feet per ton of ore, all of which is allowed to pass into the stock-solution. The volumes of second wash-water given in Table XIV for raw ores and tailings are those required when the first method is used. The average amount required for the six raw ores and tailings by the first method is 10.0 cubic feet per ton of ore. The use of the second method would reduce this to about 5½ cubic feet per ton.

The mode of using the second wash-water for roasted ores is the same as for raw ores, if the descending first wash-water was followed by solution at the time the surface of the first wash-water reached the surface of the ore. But if the first wash-water has been drained from the charge before the solution is used, then likewise the solution must be drained from the charge before the second wash-water is used. In this case the second wash-water is then applied by suddenly flooding the surface of the charge with about one-half inch of water, which descends through the charge and is allowed to pass into the stock-solution.

c. *The Total Volume of Water Required for both Raw and Roasted Ores.*—Table XIV gives the total volume of water required per ton of ore for both raw and roasted ores. For all the roasted ores, including Ontario, the average is 50 cubic feet. The average volume for all the raw ores and tailings is 10½ cubic feet, if the first, and 5½ if the second method is used.

E.—The Leaching-Solutions.

a. *Volume, Strength, Temperature, Preparation and Description of the Ordinary or Stock Solution, the Amount of Chemicals Required and the Rate of Decomposition.*—The advantages of keeping the volume of stock-solution as small as possible are, firstly, less heat to preserve a given temperature, if the solutions are to be used warm; secondly, less decomposition per day or per ton, and consequently less consumption of chemicals. The conditions upon which the volume of the stock-

solution depend are: first, the state of the ore, i. e., raw or roasted, raw ore usually requiring less solution than roasted ore; secondly, the capacity of the works per day, the volume of the stock-solution being less in proportion for works of 100 tons capacity than for those of 50 or 25 tons, as already shown; thirdly, the size of the charges, the volume of stock-solution being less in proportion for 50 ton than for 10-ton charges; fourthly, the regularity of the leaching, irregularity of using the solution necessitating a greater volume.

The strength of stock solution used at various works for roasted ores is as follows (expressed in percentages): Ontario, 1.4; Daly, 1.4; San Antonio, 0.8; Sombrerete, 1.0; Yedras, 1.8; Lake Valley, 0.8; Chloride, 1.1; San Bartolo, 0.7.

In starting works the stock solution is generally made up with 1.5 per cent of hyposulphite, the amount required for 3500 cubic feet being 3281 lbs.; for 2000 feet, 1875 lbs.; and for 1500 cubic feet, 1406 lbs.

The following statement gives the volume of the ordinary or stock solution used by the Russell process per ton of ore:

	Volumes of Stock Solution, Cubic Feet.
Silver Reef tailings.....	100
Bremont ".....	9
Veta Grande ".....	70
Silver Reef raw ore.....	137
Sierra Grande roasted ore.....	100
Yedras ".....	100
Ontario, 1887-88, ".....	196
Daly ".....	180
Veta Grande ".....	110
Ontario, 1883-84, ".....	190
Sombrerete ".....	90
San Antonio ".....	100
Chloride ".....	162
San Bartolo ".....	80
San Miguel ".....	70

The strength of these stock solutions in hyposulphite and the volumes of the first and last wash-water have already been given. The volumes and strengths of the extras are given elsewhere. This table, therefore, completes the description of the liquids used in the Russell process.

For simple alkaline ores, the solutions have all, so far, been used cold, and for raw ores and acid-roasted ores, at a temperature of 110° to 150° F. In the treatment of acid-roasted ores, even if the rest of the stock solution has been used cold, that portion immediately following the extra solution, and amounting to 18 to 24 cubic feet per ton, should be warm. In such cases, therefore, the use of an additional storage-tank for hot solution is necessary.

The ordinary or stock solution is made by dissolving a proper quantity of sodium hyposulphite in a measured volume of water in the storage-tanks. Generally the stock solution is made up of a strength of 1½ per cent hyposulphite (94 pounds for each 100 cubic feet of water).

After a little practice a stock solution of one-half the strength may often be used. The causes of the deterioration of the stock solution have already been given. In making up the extra solution, for each pound of bluestone used, one pound of hyposulphite of soda is temporarily destroyed, but is regained when the metals are precipitated by sodium sulphide. After the most advantageous concentration of the solution has been determined by experience, it should be maintained by constant addition of sodium hyposulphite, this addition being made to the extra solution for reasons already given. The strength of the solution in hyposulphite after it has been in use cannot be approximately estimated by its specific gravity for reasons that will soon become apparent. Hence a chemical test is the only one upon which reliance can be placed. The iodine method has already been given and it is the quickest and most reliable. Another method is to ascertain how much silver chloride will be dissolved by a certain number of cubic centimeters of the solution, but this is somewhat unreliable, except in experienced hands, as two hyposulphites of silver may be formed, one of which forms immediately, while the other forms only slowly and contains twice as much silver as the other.

The original stock solution gradually accumulates impurities, such as sodium chloride and sulphate and others, to slight extent, the source of which is evident. The first of these is perfectly harmless, the second diminishes the solvent energy of the solution to a very slight extent, the effect of which is simply to correspondingly increase (by 2 or 3 per cent) the volume of stock solution required per ton of ore. Calcium salts are introduced if gypsum is present in the raw ore, or if canstic lime or calcium sulphate exists in roasted ore. In case the lead is precipitated by soda, some of the calcium is also precipitated, as it would be difficult to discriminate between the two, even if the action of carbonate of soda on the one did not begin until the other had been entirely precipitated. The concentration of the solution in these salts, however, does not go on indefinitely, but

*For leaching works, as now constructed, the volume of stock solutions may be put as follows: For 100 tons' capacity, 3500 cubic feet; for 50 tons, 2000 cubic feet; for 25 tons, 1500 cubic feet.

†The small volume of solution used on the Bremen tailings is due largely to its strength (3 per cent) in hyposulphite. Owing to the extreme slowness of the leaching, a strong solution was used to shorten the time as much as possible. In nearly all the cases, except that just mentioned, less solution could probably have been used if it had been desirable to do so, but such a course would have made necessary a preliminary assay of the tailings before removal, which would have caused delay. In nearly all cases the tailings are removed before the assay of the tailings is known, a course which is nearly always allowable if leaching is systematically conducted.

reaches a maximum and then remains stationary, so that a new stock solution is never required, the same original stock solution being used year after year, although very little of the original chemicals may remain, on account of the losses and dilution, by the wash-water, which either precedes or follows or merely follows the stock solution. The amount of impurities in the stock solution at the Ontario, after two years' use, was such that the addition of harium chloride to 1.000 c. c. of the stock solution yielded a precipitate weighing 31.4 gr., after drying and 30.2 gr. after treating with HCl and igniting. The specific gravity of the solution was about 4° Beaume.

There is, however, a change in the condition of the stock solution that is of great importance, namely, in assuming a caustic reaction. Silver ores only that carry a comparatively large percentage of antimonial and arsenical compounds may be benefited by treatment with a caustic solution. Although the presence of caustic alkali, even in small quantities, is usually very injurious, the remedy is most simple and inexpensive, being accomplished either by the addition of sulphuric acid or bluestone to the stock solution. If the former is used the amount required will vary from one third to one pound per ton of ore, and the cost from one to four cents per ton. The effect of the extra solution in neutralizing caustic impurities has already been described.

One of the causes of the weakening of the stock solution is the decomposition of hyposulphite by taking up oxygen from the air. At the Ontario in '83-'84 leaching in the mill was twice interrupted, and the rate of decomposition of the mill stock solution determined. The strength of the solution was in each case 1½ to 2 per cent. In the first case the solution remained unused in the storage-tank for 26 days, during which it decomposed 5½ per cent. In the other case it remained unused 35 days, and the decomposition was 17.4 per cent. In this case, the depth of the solution was about 1½ times its diameter. The extent of surface exposed in proportion to the depth of the liquid has considerable influence on the rate of decomposition. For instance, the rate of decomposition in volumes whose diameter was seven times the depth was 1.8 times (for sodium hyposulphite) and 2.4 times (for calcium hyposulphite) the rate of decomposition for volumes whose depth and diameter were equal.

b. *Volume, strength, temperature and preparation of the extra solution, the amount of chemicals required, and the efficiency of the extra solution in the extraction of silver.*

1. *Volume and Depth of the Extra Solution.* The volume of the extra solution and its depth, in proportion to the depth of the ore, varies with the state of the ore, whether raw or roasted, and the method of leaching employed. The volume of the extra solution varies with the volume required to saturate a ton of ore. This, for raw ores or dry tailings, ranges from 6½ to 9 cubic feet per ton. For roasted ores, except the simple alkaline, the variation is 10 to 14 cubic feet per ton. For raw ores and tailings, if the extra solution is used on the dry ore, the volume of the extra is the same as the volume to saturate. For all roasted ores, except the simple alkaline, and for raw ores or tailings when the extra is not used first, the volume is six to ten per cent less than that of saturation, for a reason explained further on. For simple alkaline roasted ore, it is four to six times the volume required to saturate.

The relation of the depth of the extra solution to the depth of a wet charge, i. e., the depth after leaching has commenced, is as follows: For raw ores and raw tailings, the depth of the extra solution varies from 36 to 42 per cent of the depth of the charge of ore; for all roasted ores, except the simple alkaline, it varies from 34 to 46 per cent of the depth of ore; for simple alkaline roasted ore, it varies from 1½ to 3 times the depth of ore.

(To be Continued)

The Copper Market and the Syndicate.

James Lewis & Son's report on ores and metals (Liverpool) gives the following concerning the operations of the French copper syndicate:

The first six months of the operations of the Societe des Metaux and of the French syndicate to control the copper markets of the world, and enhance the value of this metal 100 per cent, having now passed, this seems a suitable time to criticise their effect so far, and endeavor to form some idea of how this gigantic speculation is likely ultimately to result.

The total production of the world was estimated by Messrs. H. R. Merton & Co. for the years 1885, 1886 and 1887 as 226,892, 217,070 and 224,490 tons; deducting from or adding to this the increase or decrease in the English and French stocks during each of these years, it would appear that the total consumption of copper in the world was 218,045, 208,394 and 244,886 tons respectively, or an average of 223,908 tons.

During the first half of this year it will be seen from the statistics that the imports into England and France have been 29,855 tons greater than during the same period last year, and as the production of copper in the Lake Superior district and in Montana will be much greater during the present half-year than during the past one (which included the winter months and stoppage of one-half the supply obtainable from the Calumet and Hecla mine in consequence of the fire) and the supplies from the smaller mines increased, we may reasonably

look for a similar, if not a greater, increase for the remaining six months of this year. Allowing for a similar increase of 30,000 tons, or 60,000 tons in all, the total production of the world this year promises to be 285,000 tons against 225,000 tons last year.

Our statistics show a decrease in the English and French consumption and English exports of copper during the first six months of this year of 10,000 tons. But as there is very little doubt that some 20,000 tons of copper smelted at the works of the Rio Tinto, Tharsis and Caps Companies in this country during this period are still on hand (6000 tons of English copper lying at Rio Tinto alone), in addition to the 65,000 tons of foreign copper in the public stocks, we consider that consumption has fallen off in the half-year to the extent of 30,000 tons.

As large quantities of old copper have been received since the 1st January, and this source of supply is now nearly exhausted, the decrease in the consumption of foreign copper this half-year may not fall below that of the corresponding period last year by more than 20,000 tons, although it was then exceptionally large, owing to smelters and manufacturers laying in large stocks during the great and rapid advance in values which took place the last three months of 1887.

This would give a total decrease in consumption this year of 50,000 tons, as compared with last, or say a total of 195,000 tons, against a total production of 285,000 tons, which would result in an increase in the stocks held on the 1st January last (35,000 tons) of 90,000 tons, making them 125,000 tons on the 31st December next.

Next year, unless some restriction is placed upon the output of the larger producers, we shall probably have a production of at least 300,000 tons, and even if consumption is as high as the average of the years 1885, 1886, and 1887—say 225,000 tons, there will be a further surplus of 75,000 tons, so that by the end of 1889 we may look for a stock of copper of 200,000 tons, and at the termination of the three years for which the contracts have been made by the Societe des Metaux, a stock of 275,000 tons against 35,000 tons on the 1st of January, 1888.

Chili has realized early in the month £81 5s. for cash warrants, but fell to £78 7s. 6d. on the 13th ult., the demand to cover prompts falling due having fallen off. With a revival of this demand the past week, up to £81 has again been paid, importers chiefly realizing the benefit of the advance, the syndicate having sold but little. The syndicate have continued buyers of three months prompt at £78, though in one instance £77 15s. was accepted for 50 tons from another buyer, while latterly, up to £78 10s. has been paid by other buyers. The market, however, closes much weaker, with sellers of cash at £80 10s. and of three months prompt at £77 10s.

For good merchantable copper there has been more demand of late, especially from the syndicate agents, and the price has advanced from £71 5s. to £73 15s. On the 20th ult. the English smelters fixed their price for best selected at £75, but sales were afterward made at 10s. to 20s. below this for some brands.

There has been an active demand for furnace material the past ten days, the syndicate agents having bought and offering to buy those lots not already under their control. This brought in smelters who have secured all they can, fearing that ere long they will be obliged to go to the syndicate and pay their price. For Anaconda matte, of which there are now 16 588 tons in stock here, 14s. per unit has been offered and refused, 14s. 6d. being asked.

The directors of the Quebrada Co. in their annual report state that the company's estimated production of copper has been sold to the Societe des Metaux for three years, from January 1, 1888. This company produced, during 1887, 2606 tons of fine copper, which realized an average price of £47 14s. 2d. per ton, or 9s. 6½d. per unit.

The price obtained by the Parrott Co. of Montana for their production is 13 cents per pound with half of any excess realized over this. They are permitted to produce 5000 tons (2000 pounds) this year, 5500 tons during 1889, and 6000 tons during 1890.

The Boston Montana Co. have, we understand, sold 45,000 tons for delivery over three years at 12 cents per pound, while the first contract for six months is made by the Anaconda Co. was at 11 cents, a contract for a further six months having subsequently been made, and a contract for a further period being now in course of negotiation.

One of the anomalies of the present situation is, that while those mine-owners who have contracted with the Societe des Metaux have only obtained from £53 to £65 per ton for their produce, the Chili producers obtain from £77 to £81 for their copper, the syndicate being obliged to buy all that offers in order to sustain the value of the 50,000 tons of Chili bars they already hold.

The Calumet and Hecla mine is being n-watered at the rate of about 5,000,000 gallons a day. It appears that at the present time the South Hecla, or Black hill's part of the mine, which is wholly separate from the main mine, is producing nearly as much copper as the whole mine was before the fire. The June product was 2542 tons of mineral, or 2033 tons fine copper, against 2395 tons fine during June, 1887.

The output of the seven principal Lake Superior mines for the first half of the following years has been: 1886, 18,153; 1887, 18,791; 1888, 18,931 tons (2000 pounds) fine.

The Sweetwater Dam in San Diego County.

Perhaps nothing in the progress of California is more interesting than enterprises for the storage and distribution of water. The importance of water supply in a land of dry summers needs no comment. What has been accomplished by bringing water upon arid soil involves the whole history of some of our most prosperous producing regions.

Though we have done creditable things for so young a State in water engineering, it is doubtless true that we are only beginning our great work in this direction. Probably those now living will see dozens of storage reservoirs ensconced in mountain canyons, the waters held in store by dams greater than anything yet attempted, and distributed over an area of great magnitude. Certainly the tide of affairs is setting strongly in that way; the Government work to that end, and the general disposition to combine effort and capital in local irrigation enterprises indicate that the future of irrigation in this State will be full of great things.

This week we give views from photographs of a notable water enterprise in the extreme south. The work was only finished last spring, and it has proved a notable success. It is one of the latest outcroppings of enterprise and confidence which were well placed years ago when the Kimball brothers planted themselves on the east shore of San Diego bay to grow up with the country. They were not, however, content to sit idly waiting until the country should grow and carry them along with it; they placed themselves beneath the country, so to speak, and made it grow by forces of honest and untiring pushing. Mrs. Flora M. Kimball, prepares for us a little sketch of the water enterprise of which our engravings give the most striking features.

The organization of the San Diego Land and Town Company, with 40,000 acres of land on and near National Ranch, was an important factor in attracting emigration. Col. William G. Dickinson of Topeka, Kansas, the famous town-builder for the Atchison, Topeka & Santa Fe R. R. Co., was chosen general manager of this company. Accepting the trust, he brought his family to National City, built a beautiful home, and with characteristic energy commenced his work, as he says the crowning glory of his town-building. So much having been accomplished without a system of irrigation, Col. Dickinson and his associates wisely decided that with an abundance of cheap water for irrigating and domestic purposes, both town and country would grow and prosper as they never had done before, and as it was impossible for them to do with the existing methods of water supply. The great Sweetwater dam was the outcome of this thought, the completion of which was celebrated April 19th of the present year. It was a proud day not only for National City but for the whole county, whose thousands of citizens met to offer congratulations for the success of the enterprise and to hear from the lips of those who projected and carried out the work how it had been so easily accomplished. Farmers and townspeople alike rejoiced. Troublesome old windmills were to be banished with other primitive methods adopted by agriculturists, and the unsightly water-barrel at the back door of the pretentious city home was to be among the things of the past.

The building of the dam occupied 17 months, and stands as a monument to the skill of J. D. Schuyler, chief engineer, to whom the public is indebted for his untiring faithfulness in the ex-

GENERAL VIEW OF THE SWEETWATER DAM AND RESERVOIR. SAN DIEGO COUNTY, CAL.

ecution of the great work. The dam is 46 feet in thickness at the base, 12 feet in thickness at the top, 75 feet in length at the base, and 396 feet in length at the top. It is 90 feet in height, and contains 21,209 cubic yards of masonry, in the construction of which was used 18,000 barrels of Portland cement. The reservoir is three miles in length and three-fourths of a mile wide. It covers 700 acres, and has a capacity of 6,000,000,000 gallons of water—a quantity sufficient for 500,000 people, or to cover 20,000 acres 12 inches in depth. Sixty-eight miles of wrought-iron pipe has been laid. The area of watershed is estimated to be about 150 square miles. There is not a structure of masonry on the American continent equal to the Sweetwater dam, and but four in the Old World of greater height. One of the most satisfactory features of the enterprise is, every dollar of its cost was paid as soon as completed.

The Sirieix Compensated Compass.

[From the *Journal de la Marine*, Paris.]

The naval commission of the Society of the Study of Colonial and Maritime Affairs has been called to meet with a view of examining a new system of compensating compass, invented by Mr. Leon Sirieix, an ex-pupil of the Polytechnic school, residing in San Francisco for the last 20 years.

After being introduced by Mr. L. Muller, the secretary of the commission, Mr. E. P. Voisard, a director and the general agent of the Sirieix Compass Co., placed his model of the compass over a wrought-iron structure measuring one meter in length, 30 centimeters in

width, 20 centimeters in depth, and representing the hull of a ship; then he proceeded with experiments.

To begin with, and in order to impart a larger inductive force, he placed a strong steel magnet to both ends of said iron hull. That force was such as to cause the needle of the compass to deviate as much as 160°, when the model was made to wheel around one-half revolution on its vertical axis.

After ascertaining the error, the regulator was set in its place under the compass card, and in one instant the deviation was completely annihilated. The experiment was repeated several times at the wish of those present. Among the latter were Admiral Thomasset, the president of the society; Mr. Bouquet de la Grye, the chief hydrographic engineer; Mr. Lisbonne, director of naval constructions on the retired list; Barnum Michel, an ex-officer of the navy; also several engineers, insurance companies' officers, etc.

The model used by Mr. Voisard included a bowl with an open section intended to allow those present to examine the disposition and working of the regulator and of the soft iron blocks.

The Sirieix compass is composed of a cylindrical bowl, measuring in height about twice its diameter, and is divided into two parts; the upper one carrying the compass card, and the lower one carrying the magnetic regulator for the correction of the sub-permanent magnetism; also the soft iron inductors intended to correct the action of induced magnetism.

The compass card may be made of mica, paste-board or paper; that in the model was carrying

three magnetic bars, *c, d, e*, as shown in Fig. 1. Nothing would prevent adopting a compass card with shorter needles, attached under the card, such as are those introduced for the compass destined for torpedo boats.

The regulator is composed of two disks set parallel to each other, and between them, in the center, there is one or more magnetic bars, placed one above another—according to the quantity of magnetic force that is to be corrected—and on each side of the center bar at 30° distance from the latter, a small bar very thin.

These disks may be made of glass, paste-board, brass, aluminum or any other non-magnetic substance. Those of the experimental compass were made of brass; some others belonging to smaller compasses are made of silver (German silver).

On the surface of the upper disk are found four pairs of magnetic bars of very thin size placed diagonally to each other, and disposed in such a manner that their poles alternate around the circumference so as to balance their magnetic action. At the bottom of the lower bowl there is a brass bar, carrying two small blocks of soft iron. By means of a set screw those blocks can be moved to a certain angle so as to compensate the quadrantal error resulting from the ship's soft iron. Two small vertical pins maintain the regulator in a steady position when it is raised or lowered by means of the regulating screw. Another brass bar carries two strips of soft iron intended for completing compensation, when necessary. The cap on which the regulator is fixed can be raised or lowered so as to render regulating more or less sensitive by means of a spindle traversing the bottom of the bowl.

The theory of this compensated compass, therefore, consists in generating with small magnetic bars and soft iron blocks, an equal and inverted action to that which causes the deviation of the compass card, and this result is obtained by neutralizing the force of the sub-permanent magnetism and that of the induced magnetism of the ship, whether it may derive it from its construction, its cargo or equipment. In other words, the disturbing influence is neutralized by a correcting influence that will act with an inverted polarity and will bring the needle of its compass card into the differential of those two forces.

Thomson's compass is known to require the use of a binnacle of from 70 to 80 centimeters in height, in which are placed the many compensating magnetic bars, and also masses of soft iron. In the Sirieix compass, on the contrary, all the compensation is produced with the same elements reduced to their most simple expression, at the same time generating around the magnetic needle a double magnetic action which neutralizes the influence from the ship's iron. As can be seen by this short description, the compensation of this compass is obtained in a very simple manner without the adjunction of compensating masses of iron outside of the instrument, such as the large balls of the Thomson compass, and also without any systems for regulating, which are always delicate and require being very frequently adjusted.

The compass of Mr. Leon Sirieix has also the advantage of returning very promptly to its position of rest. Mr. Voisard has not hesitated coming from San Francisco to Paris, as he had it at heart to secure the approbation of his countrymen. We will recall the fact that this compass has been carefully examined in the United States by special professors, and by a commission appointed for the purpose by the navy department. It has been very favorably reported on, and the instrument has already obtained a great notoriety.

Passing Events.

It is not to be expected that we can always include in our category of "Passing Events" much that is startling or even altogether new to the readers of the PRESS. Occurrences that would arrest general attention, and perhaps excite deep interest in communities where mining is pursued in a small way, pass by here unnoticed or elicit but a casual remark. What in most other countries would create a tempest produces here but a ripple on the surface of the deep-flowing current of mining events. The great industry moves on little influenced by the accidental happenings that mark its career, the outcome as a whole being so satisfactory and grand.

Since our last issue Central Nevada has been visited by a rainstorm of such phenomenal violence, that but for its long continuance and the area it covered, might have been mistaken for a regular "cloud-hurst."

There prevails a water dearth in some parts of the mining regions, its effects being most felt in the quartz districts of California and in the vicinity of the Comstock lode, where many

stamps have been hung up in the mills, dependent on water for their motive-power.

The State Mining Bureau is just now the scene of much activity, not to say of downright hard work.

The copper miners, encouraged by the high prices ruling for that metal, are everywhere exerting themselves to make as large a production as possible—making hay while the sun shines.

Forest fires with much excessively hot weather have of late prevailed in the interior. Apropos to this condition of things, a Presidential canvass being in progress, the political dog-star reigneth. What makes it pleasant for both parties to the contest is that each is entirely confident of success. Our motto is: "May both win."

A Commission to Investigate the Debris Question.

Early in its present session a bill was introduced in Congress relative to the business of hydraulic mining in California. By the provisions of this bill the General Government is required to appoint a commission of engineers to ascertain and report to what extent, if at all, hydraulic mining can be carried on in the enjoined districts without causing additional injury to the farming lands or further obstructing the navigable waters of the State. This commission is to consist of Government engineers and to be paid out of the public treasury. This bill in the Senate having been referred to the Committee on Mines and Mining, that body, through its chairman, Wm. M. Stewart of Nevada, has reported it back favorably, recommending its passage.

In its report this committee recites the fact that the Legislature of California, at its last session, requested Congress to enact a law of this kind, a resolution having been adopted by both the Senate and the Assembly to that effect; also that many and numerous signed petitions from this State have been sent to Congress asking that measures be adopted for relieving the miners from the hardships of which they complain, if this can be done without detriment to other important industries and interests.

This done, the history of hydraulic mining in California is briefly recounted, its growth from small beginnings into a great industry, the costly improvements made for its furtherance and its large and profitable output of gold being succinctly set forth. Epitomizing the subject, the topography of the mining region, the plan of operating by this process, and its effects upon the outletting streams are described. The injury arising to the public through the shutting down of these mines and the financial ruin in which it has involved the owners are forcibly presented; the committee reminding Congress that this class of miners when they bought their lands from the General Government, paying an extra price for them, did so with the implied understanding that they should be allowed to work them by the hydraulic method, it being impossible to work them by any other.

In consideration of the premises the committee recommend that the General Government appoint a commission of its own engineers to visit the mining districts and by actual inspection ascertain the cases in which it would be practicable for the miners to so impound their tailings that they would cause no further serious harm to the agricultural lands nor yet much increase existing impediments to navigation, the committee expressing the opinion that such commission would, on a careful examination, find some, and perhaps many, cases of this kind; their report concluding with the remark that, "The United States having undertaken to enjoin the working of these mines through the Federal courts, your committee deem it reasonable that a thorough investigation should be made by the United States, to the end that no more mining property shall be destroyed by Federal injunctions than is necessary for the preservation of the rivers and the protection of the farming lands in the valleys."

In this report the well-known familiarity of Senator Stewart with everything that relates to mines and mining is amply apparent, and while the paper is moderate and even conservative in tone, it discloses a desire that hydraulic mining may be permitted to go on wherever this can be done without material prejudice to other interests.

As the General Government is to defray the expenses of this commission, there can be no

good cause for objecting to its appointment. Heretofore most of the testimony taken in the investigation of this question has been *ex parte* and, therefore, more or less biased, or open to the suspicion of being so. Even the professional work done has partaken largely of this character, the parties complainant and defendant appearing each with their own set of experts, viewers, and specialists. Not only so, but the contestants themselves have been permitted to take the stand and testify in their own behalf.

Under these circumstances, the testimony of witnesses would naturally be tinged, if not violently warped, by self-interest or prejudice. Presumably all have been more or less prepossessed one way or the other. What is now required is information derived from a competent and, at the same time, wholly disinterested source, such as that to be obtained through the proposed commission would undoubtedly be. Trained engineers, selected with reference to their fitness for such service, exempt from all local influences and wholly impartial, their findings, whatever they might be, would command the confidence of all and give general satisfaction. Even the miners would be likely to accept them as final. If nothing can be done for the relief of this class, as perhaps there cannot be, it were well they should know this as soon as possible, to the end that they adopt some other method for working their gravel deposits so far as practicable, and, giving up the legal warfare in which they have so long been engaged, conform their action to the inevitable. It is to the interest of all—the farmer, the miner and the general public—that this much-vexed question be set at rest.

Trinity County Mines.

Reports come to us indicating much activity and confidence in the mining future of Trinity county. Few districts of the State appear to be coming more encouragingly to the front. The new discoveries are numerous, and some of them, it is confidently expected, will soon take rank among the leading mines of the State. The town of North Fork is particularly lively just at this time, says the *Trinity Journal*. The mines owned by John Day, which are now being developed, are evidently on a good paying basis. An arastra is kept running night and day on what, we presume, is picked rock, as it is reported to pay \$125 to the ton. The Thanksgiving mine, owned by Bargin & Co., is turning out good ore. The Enterprise Company is building an ore-hin that will hold 3000 tons of rock. There are a large number of promising mines being developed in this vicinity, and a mill will soon be erected there. The Davis Brothers, John Day, James Haley, and others, are meeting with great encouragement. The mines owned and controlled by Capt. Trueworthy, known as the Orland, Fountain Head, Grizzly, Bell and other mines, are looking well. He has a force of men at work on each of the above-mentioned mines, and the more work is done the better the ledges develop. The ledges promise from \$20 per ton up to very high figures.

The captain was in this city a few days ago and left with plenty of money to carry on his work of development. He has spent the last two or three years in prospecting along the north, east and south forks of the Trinity, a scope of country of over 100 miles. Captain Trueworthy's character has so long been proverbial among old-time business circles of the State for frankness and integrity that we put great faith in the information gathered from him. The "honest captain" has faithfully explored the region of which he speaks, and his opinion is that the mineral prospects and mines of Trinity are just entering upon a long term of signally profitable working. The quartz veins are, for the most part, of ample width, and wood and water are more than usually abundant. New roads and other improvements are being made in localities heretofore reached only by rough trails.

Much placer ground is also being worked with large profit. The mines yield free gold very generally and the sulphurets are in richness all that a reasonable miner could ask. Some of the most conservative and wealthy business men of the city are investing in these mines. The town of North Fork is distant 17 miles by stage from Weaverville, the county seat. East Fork is about five miles to the northward. New River (North) is 35 miles distant.

Making Provision for the Oncoming Generation.

More than once has this journal taken occasion to say something about the importance of early training the youth of California to habits of industry and the advantage of providing labor-schools as auxiliaries to that end. But, all this accomplished, little will it avail unless there shall at the same time be provided ample and suitable labor for these young people to perform. Simultaneously with this preparation of the children for work, the work itself must be furnished to their hands. The land and the mines present in this country broad fields for the employment of labor, open to all. But this labor is of a kind that cannot be made universally available. It needs to be supplemented by other forms of industry. And it is in these that California is deficient. We require a system of more diversified pursuits, to the end that every kind and class of laborers may be furnished with employment. Not always can the boys, the girls, or the women leave the cities and towns and go out on the land or into the mines to work.

We have in this State 50,000 youths who should be earning their own livelihood or contributing something toward that end, but who are doing little or nothing, because there has not been supplied suitable work for them to do. Now, whether such labor shall be supplied or not, one thing is certain—these young people are bound to get a living somehow or another. There is no mistake about that; and if in the future we shall find ourselves with a disagreeably large number of these idlers on our hands it may puzzle us not a little to know what to do with them. We need not hope to get rid of them through recourse to emigration. They will not emigrate. They are here to stay; we may count upon that. They are attached to California, and, like some other of her indigenous growths, would not probably well hear transplanting. Persons born or long resident here are not apt to thrive or meet with contentment elsewhere. And as we cannot have riddance of them through emigration, so will it be found impracticable to lasso, and after 24 hours' impounding, dispose of them as we do the tagless dogs. It will really be best for us to utilize them as well as we can; and in the possibility that this youthful population will be neglected and suffered to grow up in idleness and vice lurks one of our direst perils, for it is the young that in every community constitute the element of greatest danger. Hence the importance of looking after them betimes and so providing for them that they may be self-supporting instead of becoming leeches and depredators on society.

Something might, of course, be said about extending our care to this class on the score of duty and humanity. But this is a commercial age—the trading instinct predominates; wherefore it is as well to discuss this question in the light of its economic value alone. We must be able to show the average tax-payer that there is money in the proposition, if we would interest him in the temporal salvation of this or any other class. And certainly the course we are recommending has the true business ring, since it establishes that it is cheaper to prevent pauperism and crime than to provide for the one and punish the other—shows that it costs more to convict and hang a boy than to bring him up rightly, the same being true of a girl.

Between natural increase and immigration, California is destined to a rapid growth of population. We produce the raw material for many kinds of manufactures cheaply and abundantly. Possessing in these the principal elements requisite for building up a system of diversified industries, we should address ourselves to that business at once and so push it that we will, in the course of a few years, be able to make things varied in kind and infinite in quantity—things necessary and unnecessary, useful and otherwise. Whatever is required to minister to the wants, desires and comforts, and even to the vanities and follies of mankind, that should we be preparing to supply—producing a thousand things that we need and twice as many that we don't need.

True, besides working the land and the mines, felling forests, building ships, forging iron, etc., we ought to be getting ready to make French dolls, German toys, jumping-jacks and flingdangs of every kind, because if these things are not made at home they will be purchased

abroad, and so money be sent away that ought to be kept in the country.

In looking over the list of our imports, one is astonished at the large number of articles it contains and the amount of money they annually cost us, the most of these being articles, too, for the growth or manufacture of which we enjoy here in California special advantages. Some of them are, in fact, composed of materials produced here, and which, after being carried away 20,000 miles and made up into various forms, are brought back and sold to us with cost of freight, handling, insurance, storage, manufacturing, and in some cases foreign duties, added. Thus we export wool, hides and tallow, portions of which come back to us made up into clothing, hats, boots and shoes, harness, soap, candles, etc. Enormous quantities of hog-stuffa, butter, eggs and cheese, and even canned fruits of certain kinds, are every year shipped to California from the East or other countries and here sold at a profit.

We cannot say exactly how many thousand bushels of choice fruits are annually suffered to rot under the trees in California, but they amount to a good many.

It looks like there were in all this a lack of thrift; and, in fact, there is. We not only neglect our opportunities, but we waste our substances at a most impoverishing rate. What is required is that we should make more, save more, and lay less, patterning in this respect after New England and Old England, who make about all they want and much to spare.

There being work enough here to be done, there will be good times for all if only it can be so arranged that labor and capital shall each do its part toward insuring effective and harmonious co-operation. Our resources are ample. It only needs that they be actively developed through the judicious and skillful application of these prime factors of production to secure to California a great and lasting prosperity.

Opportunities having been created and work provided for the oncoming generation, it is to be hoped that they will take to it kindly, especially where the conditions are so generally good and the rewards so ample as here in California. The youth of this State should bear in mind that their lot has been cast in a highly favored land, their burdens being light compared with those that have to be borne by the laboring classes in most other countries. Owing to our mild and healthful climate, much of our out-door work would be considered almost a pastime by the inhabitants of the Northern States and Canada, while the toiling, hunger-pinched millions of Europe would feel richly rewarded were they to receive half the wages paid the well-fed laborers of California. These are considerations that should not only reconcile the wage-earner of this State to his lot but fill him with a great contentment, and a determination to turn these many advantages to good account.

Accidents to Miners.

Francis Cook was killed August 12th while at work on a glance-crib on the railroad in British Columbia, being struck by a tree that was passing down the crib. Deceased, who was about 22 years of age, came from Bell Creek, Prince Edward Island, where his father resides.

August 19th, John McCormick and Con McCarthy were hurt, the latter very seriously, while drilling on a drift in the Elkhorn mine, Montana. McCormick, who was handling the drill, had his left eye entirely destroyed and quartz blown into the other, which will doubtless render it practically useless, if it is not totally destroyed. Besides this, he had large holes blown in his neck, and the front of his face and neck were lacerated to a great extent by the flying quartz. McCarthy fared better. He, too, was knocked down, but soon recovered himself, walked out of the drift and gave the alarm, and both men were soon brought to the surface. McCarthy's face and eyes were filled with flying quartz, though to less extent than McCormick's, and it is now believed that both his eyes will be saved. McCormick now lies in a critical condition, and, should he recover, it is more than probable that he will be totally blind.

John Kennedy, a short time since, fell down the shaft of the Queen Bee mine at Mineral Park, Arizona. The shaft is about 40 feet deep, but Kennedy reached the bottom without breaking any bones or receiving other serious injuries.

Charles Northey, a miner, coming off shift at the Hallock, Butte, Montana, after his night's work, gave the signal to hoist from the 300 foot level. The engineer carelessly took his foot off the brake before turning on steam, and the result was that the cage dropped. It was about 130 feet from the bottom of the shaft, and, after it had fallen 30 feet or so, the engineer caught it, but stopped it so suddenly that Northey was thrown out and fell to the bottom of the shaft, resulting in his instant death. The deceased leaves a widow and two children.

The Golden Gate Concentrator.

We give on this page engravings of the Golden Gate concentrator. This machine consists of a tray about 11 feet in length resting on a stout iron framework upon which it has a

vacuum, sufficient to sustain a column of four or five inches of water, is constantly maintained by a small exhaust fan. On the lower side of the exhaust pipe, above the protecting plate, are openings into which the gangue and water are drawn, by the vacuum maintained, being then discharged over each side of the machine into the waste-slucio.

The operation of the concentrator is as follows: The crushed ore, with a suitable amount of water, is fed on to the horizontal part of the tray through the distributor shown at the extreme left of the figure. The peculiar motion communicated to the tray causes the pulp to slowly travel toward the protecting plate, and at the same time keeps the pulp in a loose condition, allowing the heavier mineral to sink to the bottom, so that, on arriving at the plate, the pulp is separated into distinct layers, with

Side and End Elevation Showing Driving Apparatus.

End Elevation Showing Distributors, Etc.

THE GOLDEN GATE CONCENTRATOR.

longitudinally reciprocating movement. This reciprocating movement varies in speed in such manner as to cause the pulp, fed upon the tray at one end, to travel slowly over its surface toward the other end, and the pulp is, by the shaking motion, kept in a loose condition so that the mineral may settle out of the gangue upon the surface of the tray. The tray proper consists of two distinct parts, forming, however, one continuous surface; one part, being designed for the settling of the mineral, is horizontal and has hardly any perceptible current of water, thus allowing the fine mineral to settle out of the water and reach the bottom of the tray; the other part has an adjustable inclination upward from its junction with the horizontal part, and over this part the current of wash-water flows which washes away the gangue from the mineral. At the junction of the horizontal with the inclined part of the tray, and extending across its width, is a protecting plate, set somewhat above its surface and parallel thereto. Above the protecting plate is an exhaust pipe within which a

the mineral at the bottom, the heavy gangue above the mineral, and the light gangue and water at the top. The plate, having been properly adjusted for the ore, allows all the mineral, with some of the gangue, to pass under it, while the larger part of the gangue and all the surplus water pass above the plate, and on arriving at the exhaust pipe are instantaneously drawn off and discharged over the sides of the tray into the waste-slucio. That portion of the pulp which has passed under the plate, now consisting largely of mineral, continues on up the inclined part of the tray, where it can be freed from that part of the gangue which is still mixed with it by a current of water flowing down from the head of the tray, this gangue and wash-water being taken away by the exhaust pipe, as before explained.

This machine has done highly successful work on various classes of ores. It offers to the ore fed upon it a quiet settling space, with very little current, some seven or eight feet in length, whereon the mineral particles, even the finest, may reach the surface of the table, and

after the mineral has once settled upon the tray, it is saved, since in the arrangement and operation of those other parts of the tray intended for the removal of the gangue, especial care is taken to avoid all disturbance of the mineral while it is passing upward to the head of the tray.

It is well known that in order to get the best results from stamps, a large quantity of water must be used, and with concentrators capable of taking the product from a single battery of five stamps, it has always been a difficult problem to dispose of the excess of water; and the various means devised for the purpose have always been the occasion of considerable loss either of fine mineral or of amalgam.

The common expedient of diminishing the battery-water, while decreasing the capacity of the battery and favoring the production of slimes, requires, in order to carry off the pulp with the diminished water supply, an excessive pitch to the battery-apron, and thus prevents the proper amalgamation of the mineral upon the latter. This danger of flooding the ordinary concentrator with water, which is so serious even when it is taking only the product of a single battery of five stamps, of course becomes entirely unmanageable when an attempt is made to run the product of 20, or 15, or even of ten stamps upon a single concentrator.

With the Golden Gate concentrator there is no need of reducing the water supply of the stamp-battery or of giving an undue pitch to the battery-apron, since one of these full-sized tables will take all the water from a 20-stamp battery; and, furthermore, the presence of this large amount of water upon the concentrator, so far from interfering with the process of concentration, is of positive benefit, since, by the large dilution of the pulp, the settlement of the mineral is greatly promoted, and this benefit is generally more marked when treating the more difficult classes of ores.

All the operative parts of the tables are especially designed to favor and promote the prompt separation of the mineral particles from the gangue and water, and, after this separation into distinct layers has once been effected upon the horizontal part of the tray, to avoid all disturbance of the mineral until it is discharged, clean, over the head of the tray.

Its construction and the mode of applying the water used to the concentrator are specially designed to guard against any disturbance of the mineral stratum. This water used, owing to its peculiar construction, discharges the wash-water with a minimum velocity, and is placed, virtually, outside the proper head of the tray. By this disposition a quiet, even flow of water is secured which will not disturb the finest particles of mineral.

With a tolerably clean iron sulphuret ore, concentrating with fair facility, screened through a screen of 60 meshes to the linear inch, this machine will serve a 15-stamp battery; and the loss, it is claimed, will not exceed five per cent. The agents for this concentrator on this coast are Parke & Laoy.

SUPERINTENDENT BUCK of the California Slate Company was in Placerville the other day arranging for the shipment to San Francisco that day of two carloads, or 70 squares, of slate. He has now got his quarry fairly opened, and will be enabled to ship a carload every second day. Fourteen men, all whites, are employed now, and this force will soon be increased, since orders are coming in much faster than they can be filled. This company owns 500 acres of land in the vicinity of Chili Bar. The quarry now being operated by the California Slate Company is but two and a half miles from Placerville. The above is only one of the three quarries in the neighborhood. Messrs. Perine & Mothersole have been taking out slate of the first quality at the Chili Bar quarry for months, and at the Jacob Strahle quarry work was begun on July 3d and is being vigorously prosecuted.

THE Willamette came off the dry-dock at the Union Iron Works the other day. She went on the dock several months ago a collier and now comes off a full-fledged steamer, the sister-ship to the Umatilla, which underwent the same transformation several years ago. The Willamette is now alongside the wharf of the Union Iron Works, where she will be finished and furnished.

SCIENTIFIC PROGRESS.

Science and Veracity.

Prof. T. H. Huxley once wrote as follows: So far as my experience goes, men of science are neither better nor worse than the rest of the world. Occupations with the endlessly great parts of the universe do not necessarily involve greatness of character, nor does microscopic study of the infinitely little always produce humility. We have our full share of original sin; need, greed and vainglory beset us as they do other mortals; and our progress is, for the most part, like that of a tacking ship, the resultant of opposite divergencies from the straight path. But, for all that, there is one more benefit which the pursuit of science unquestionably bestows. It keeps the estimate of the value of evidence up to the proper mark; and we are constantly receiving lessons, and sometimes very sharp ones, on the nature of proof. Men of science will always act up to their standard of veracity, when mankind in general leave off sinning; but that standard appears to me to be higher among them than in any other class of the community.

I do not know any body of scientific men who could be got to listen without the strongest expressions of disgusted repudiation to the exposition of a pretended scientific discovery which had no better evidence to show for itself than the story of the devils entering a herd of swine, or of the fig trees that was blasted for hearing no figs when "it was not the season of figs." Whether such events are possible or impossible, no man can say; but scientific ethics can and does declare that the profession of belief in them, on the evidence of documents of unknown date and of unknown authorship, is immoral. Theological apologists who insist that morality will vanish if their dogmas are exploded, would do well to consider the fact that in the matter of intellectual veracity science is already a long way ahead of the churches; and that, in this particular, it is exerting an educational influence on mankind of which the churches have shown themselves utterly incapable.

The Moral Influence of Climate

Somewhat cognate to the above is the following which we clip from an exchange: "Since the revival of naturalism the tendencies of educational reform make it probable that the progress of moral philosophy will become identified with the development of a new science, thus far only outlined in a few incidental treatises on the interaction of body and mind. The possibilities of that science are suggestively indicated by the results of the statistical studies devoted to one of its branches—the moral influence of climate. Modern French scientists are nothing if not methodical, and have repeatedly called attention to the curious regularity in the geographical distribution of certain vices and virtues; Intemperance, for instance, north of the forty-eighth parallel; sexual aberrations, south of the forty-fifth; financial extravagance in large seaport towns; thrift in pastoral highland regions. It is, indeed, a remarkable circumstance that in the home of the best wine-grapes, in Greece and Southern Spain, drunkenness is far less prevalent than in Scotland, or in Russian Poland, where Bacchus can tempt his votaries only with nauseous vodka. The idea that a low temperature begets an instinctive craving for alcoholic tonics seems disproved by the teetotalism of the Patagonian savages who horseplay every Spanish stimulant-monger without benefit of clergy. The Lashian mountaineers, too, observe the interdiction of the Koran in the icy summit-regions of the Caucasus; but there is no doubt that the bracing influence of a cold climate affords a certain degree of immunity from the debilitating effect of the alcohol vice, and that a Scandinavian peasant can for years survive the effects of a daily dose of alcohol that would kill an Egyptian fellow in a single month."

MINERAL AGGREGATIONS IN VEGETABLE GROWTHS.—It is a singular and as yet unexplained fact that in certain species of vegetable growth there is found a variety of stones supposed to be formed and deposited in their tissues from the siliceous and calcareous juices circulating in their organisms. Thus, in the bamboo a round stone is found at the joints of the cane called "tehasheer." Another curiosity of the sort is the "cocoanut stone," found in the endosperm of the cocoanut in Java and other East Indian islands. Dr. Kimmins describes it as a pure carbonate of lime. It is sometimes round, sometimes pear-shaped, while the appearance is that of a white pearl without much luster. Some of the stones are as large as cherries and as hard as feldspar or opal. They are very rare and are regarded as precious stones by the Orientals and charms against disease or evil spirits by the natives. Stones of this kind are sometimes found in the pomegranate and other East Indian fruits. Apatite has been discovered in the midst of teakwood.

HOW SUMATRA FISHERMEN TEST THE DEPTH OF THE SEA.—On some parts of the coast of Sumatra and the neighboring islands the fishermen test the depth of the sea and also the nature of the sea bottom by the noises they hear on applying the ear to one end of an oar of which the other end is plunged in the water. At a depth of 20 feet and less the sound is a crepitation, similar to that produced when salt is thrown on burning charcoal; at 50 feet it is like the tick-

ing of a watch, the tick being more or less rapid, according to whether the bottom is entirely of coral or alternately of coral and mud, or of sand. If the bottom is entirely of sand the sound is clear; if of mud it resembles the humming of a swarm of bees. On dark nights the fishermen select their fishing-grounds according to these indications.

CURIOSITIES OF MAGNETISM.—Most well-informed people are doubtless aware, remarks a contemporary, that the globe on which they live is a great hall of magnetism, but comparatively few have an adequate idea of the influence this property is continually exerting on all sides; that many common but inexplicable phenomena can be traced directly to this source. Statistics go to show that in the matter of steel rails, as many as 13 will become crystallized and break where they go to make up a railroad track running east and west, before one of those on a north and south track is similarly affected. This is entirely due to the magnetism generated by friction, and the fact that the polarity of the magnetic current is in the former instance resisted in the headlong rush of the train, whereas in the latter case it is undisturbed. Another strange effect of this peculiar and occult force is that exerted on the watches of trainmen. A timepiece carried by the conductor running a train 20 miles an hour, however accurate it may be, will, if the speed of the train is increased to say 50 miles, become useless until regulated. The magnetism generated by the flight of a train may be said to be in proportion to the speed with which it is propelled, and the delicate parts of a watch, numbering all the way from 400 to 1000 pieces, and peculiarly susceptible to this influence by reason of the hammering and polishing they have received, are not slow to feel the effect.

SHADOWS ON THE WALL REDUCED TO A FINE ART.—The making of shadows is becoming a matter of high art in France, where the recent work of a young artist, Caran d'Ache, has come to be distinctly known as "French Shadows." Historical military scenes are favorite representations of this artist at a Parisian theater. Entire armies in their various movements pass across the screen, and in the curious processions the figures of celebrities are so accurately out that they can be recognized. Great combats and the capture of redoubts are shown. The figures are of sheet zinc, about 18 inches high, and are moved before a powerful lamp by several operators, causing the enlarged shadows to be projected on the screen. The flash of artillery is produced by a wad of gun-cotton, the roar of the cannonading by the big drum of the orchestra, the discharge of musketry by a large rattle, and the smoke by a cigarette. Many of the silhouettes, as in the drill where the guns move in unison, act through mechanism, and some are colored in parts by having apertures covered with transparent paper.

IMMENSITY IN THE SIZE AND DISTANCE OF THE STARS.—While the lowest estimate places Sirius, the brightest though not the nearest of the stars, as much as 50,000,000,000 miles away from us, "good authorities," says G. P. Serviss, "regard the distance as being not less than 100,000,000,000 miles, in which case the star's brilliancy must be as much as 228 times greater than that of the sun! And yet even Sirius is probably not the greatest unbelonging to the visible universe. There can be little doubt that Canopus, in the southern hemisphere, is a grander sun than Sirius. To our eyes, Canopus is only about half as bright as Sirius, and it ranks as the second star in the heavens in the order of brightness. But while Sirius' distance is measurable, that of Canopus is so unthinkably immense that astronomers can get no grip upon it. If it were only twice as remote as Sirius it would be equal to two of the latter, but the probability is its distance is much greater than that. And possibly even Canopus is not the greatest gem in the coronet of creation."

THE INFLUENCE OF TEMPERATURE UPON THE VALUE OF BLEACHING POWDER.—John Pattinson has instituted a series of numerous experiments to ascertain the influence of temperature upon the value of bleaching powder, which show that the higher the temperature is, the greater is the loss of the bleaching powder in active chlorine, if kept at such temperature for a considerable length of time. Thus, bleaching powder kept for 11 months at 60° C., lost 6 per cent; at 70° C., 7.8 per cent; at 80° C., 17 per cent, or according to those temperatures 0.55, 0.71 and 1.64 per cent in one month. By this alteration the bleaching powder, which is so-called calcium chloroxyd, is converted into calcium chloride, and the amount of calcium hydrate slightly increased.

HOW A NEW TANNING AGENT IS OBTAINED.—Pyrofusine, the new tanning agent, is obtained by digesting coal tar with caustic soda at a boil, and neutralizing the resulting liquor with hydrochloric acid. The inventor claims it is only half as costly as the hark process and from 20 to 30 per cent cheaper than the alum process.

IT IS SAID THAT SCALES FOR WEIGHING DIAMONDS are brought nearly to that delicacy of balance which would enable deslers to detect flaws in the stones by minute variations in weight. They weigh accurately the 640th part of a carat.

MECHANICAL PROGRESS.

A New Principle in Steam Packing.

Wherever steam pistons have been packed to prevent the escape of steam, the object has been accomplished by forcing the hemp or rings, or whatever was used, against the surface of the cylinder. That this system has been perfectly satisfactory in thousands of cases is undeniable, that it has not always been satisfactory is equally undeniable. That nearly all sorts have been satisfactory in certain cases is probably true, but that any one sort has always been satisfactory no one believes except makers of that particular sort. That the principle embodied in the new plan will always work right is not at all likely, but will, in many cases, I believe, where others have failed. The reason the simple small square rings turned eccentric and sprung in the cylinders do not always prove successful is due to the difficulty in establishing a proper balance between two conflicting conditions; sufficient initial tension so as not to be stuck fast by had oil or abrasion, or liability to unduly wear themselves and the cylinders if given too much seat.

The new principle recently introduced and described by Prof. John E. Sweet, read at a meeting of the American Society of Mechanical Engineers, lately held in Philadelphia, is described as follows: It consists of a common eccentric ring hooked together by a clamp which forms a part of the ring itself, and this hook-clamp limits the expansion of the ring and changes the whole principle of its action. The rings are cast heavy, rough turned very much larger than the cylinder, a piece cut out, sprung together and fitted with the hook-clamp or shoes, left slightly larger than the cylinder and then returned to a tight fit. The rings can compress to a limited extent, but cannot expand. In use they act, or are supposed to act, as follows: When the engine is first started and the hot piston moves to the cold end of the cylinder, the rings compress and allow it to go free; but when both cylinder and piston get up to working temperature, the rings just fit and work without any pressure and very little tendency to wear. Fling out the hooks compensates for wear when it has taken place. It will be seen that the hook-clamp is longer at one end than the other. The object of this is to break joints when two rings are placed side and side in the same groove, and thus cut off the leak that would otherwise take place through the gaps. The hook-clamps or shoes are placed at the bottom of the piston in the horizontal engines, and secured by leaving them a tight fit and allowing the follower to bind them fast.

Behavior of Steel During Hardening.

After an article is dipped to the required depth, it should, if straightness be of importance, be held quite still until reduced to the temperature of the water, because if taken out before, or reduced in temperature, it is especially apt to crack; and it is better to have a deep tank of water, if the body of the metal is great, so that the steel may be dipped slowly downward and become cooled sufficiently rapidly to harden without any lateral movement except it be after the steel has lost its redness.

When a piece of steel requires to be hardened at one end only, the dipping must be performed with a view to make the graduation from the soft to the hard metal extend over a broad section of metal, for if the jointure of the hardened end with the soft metal is abrupt, the hardened end is apt to break short off. The method of dipping, therefore, is, in this case, to plunge the end of the steel vertically into the water to a depth a little more than equal to the depth it requires hardening, and, after holding it still there until blackhot (that is, as soon as its redness has gone) dip it slowly a little deeper, and then raise it out to the amount of the increased dipping, and slowly immerse it again.

When a piece of metal requires hardening and tempering at one part only, we may heat the steel behind the part to be tempered to redness, and dip the article so as to harden the required part, and leave sufficient heat in the contiguous metal to raise the temperature of the hardened part enough to temper it. This plan is usually followed in the tempering of lathe and planer tools, flat drills, etc. If, however, the method of dipping is to hold the steel in the water at an even depth after the immersion, the temper color will be very narrow, while if the steel be raised and lowered in the water, the color-band will be broad.—*Builder's Report.*

CRYSTALLIZATION BY REPEATED HEATINGS. Thomas Edington & Sons of the Phoenix Iron Works, Glasgow, write *Engineering* as follows: We have observed the correspondence on this subject in your journal, and we think our experience may prove interesting. In the manufacture of cast-iron pipes of small diameter, we use as core bars iron tubes made from strips of good quality; these bars are exposed to a temperature of between 600° and 700° Fahr. in the drying stove, and again to a high temperature when the metal is poured into the mold. The result of the repeated heating and cooling is an alteration in a very short time of the structure of the iron from fibrous to crystalline. The stove for drying the cores are heated with gas from a Wilson producer, so that in this case the change of structure can scarcely result from the presence of finely divided carbon. We find

that the wrought-iron in the spindles of core bars for large pipes is affected in the same way. Again we find that the chains, used for suspending pipes in the dipping pans, lose their fibrous structure in a comparatively short time, although the temperature of the coating mixture never exceeds 350° Fahr. Of course, while exposed to this temperature, the chains are always in a state of tension, which will vary according to the weight of the pipes.

WEIGHT OF LOCOMOTIVES.—The size and weight of locomotives have steadily been increased ever since they were first used, and there is little reason for thinking that they have yet reached a limit, although it seems probable that some material change of design is impending which will permit of better proportions of the parts or organs of the larger sizes. The decapod engines built at the Baldwin Locomotive Works, in Philadelphia, for the Northern Pacific railroad, weigh in working order 148,000 pounds. This gives a weight of 13,000 pounds on each driving-wheel. Some ten-wheeled passenger engines built at the Schenectady Locomotive Works for the Michigan Central railroad weigh 118,000 pounds, and have 15,666 pounds on each driving-wheel. Some recent eight-wheeled passenger locomotives for the New York, Lake Erie & Western railroad weigh 115,000 pounds, and have 19,500 pounds on each driving-wheel. At the Baldwin Works some consolidation engines are now in progress which, it is expected, will be still heavier than the decapod engines.

TINNING BY SIMPLE IMMERSION.—Argentina is a name given to tin precipitated by galvanic action from its solution. This material is usually obtained by immersing plates of zinc in a solution of tin containing six grams (about 90 grains) of the metal to the liter (0.88 quart). In this way tin scrap can be utilized. To apply the argentine according to M. P. Marino's process, a bath is prepared from argentine and acid tetratate of potash rendered soluble by borio acid. Pyrophosphate of soda, chloride of ammonium or caustic soda may be substituted for the acid tetratate. The bath being prepared, the objects to be coated are plunged therein, first having been suitably pickled and scoured, and they may be subjected to the action of an electric current. But a simple immersion is enough. The bath for this must be brought to ebullition, and objects of copper or brass, or coated therewith, may be immersed in it.

COMPRESSED PAPER FOR AXLE BEARINGS.—Experiments have recently been made on Prussian railways with axle-boxes fitted with bearings of vegetable parchment in place of brass. The parchment is strongly compressed before being used, and it is thoroughly dried to prevent subsequent shrinkage. Wooden rings are placed on the outside of the bearings, fitting the collars of the journal. An emulsion of water and oil and all the mineral oils are used as lubricants. The parchment soon becomes impregnated with oil, and is able to go a long time without a renewal of lubrication. It is between the body of the journal and the thin edge of the parchment segments that friction takes place. The claim is made that the compressed paper bearings make a tough material that is superior to metal. Such bearings are also in use in a German sawmill, with satisfactory operation.

TEMPERED BRASS.—The art of tempering copper and bronze seems to be made a study in many quarters. We frequently find mention of success in that direction. The latest is as follows. The Milwaukee *Sentinel* says: F. M. Stowe of Winneconne has solved the problem of tempering brass. He has shown an edge tool that will cut a seasoned pine or hemlock knot without affecting the tool, and the various tests he has made proved it superior to steel for cutting purposes, as it takes altogether a finer edge.

READ YOUR MECHANICAL JOURNALS.—The mechanic who thinks he knows so much that he can gain nothing by reading technical papers has either passed or is rapidly passing his field of usefulness. The really valuable mechanic, in the large sense of the word, will go over miles of, to him, old information for the sake of finding one point that is really new. Read your mechanical journals thoroughly and carefully.

A NEW MATERIAL FOR TELEGRAPH POLES.—A new use for cement has been found in England in the making of telegraph poles. The poles consist of an iron shell filled up with the cement or concrete, which incloses a core of wire netting which is carried up the interior. They are claimed to be much lighter than those of cast iron, and practically indestructible.

AMERICAN PUMPS IN LONDON.—An American pump-making concern has heard the British lion in his den by establishing a European office in London. American pumps sell largely in Australia and South America. It cannot be their cheapness, but their superiority that makes them in demand in those far-away countries.

THE INVENTIVE YANKEE OUTDONE.—Give honor to whom honor is due. It is apparent that the inventive Yankee has been outdone for once. An Englishman has invented a resorpting machine. You put your dull razor into a rest prepared for it, turn a crank, and the thing is done.

USEFUL INFORMATION.

A Substitute for Gum Arabic.

The high price of gum acacia has led Trojanowsky to seek for a substitute. This he believes may be found in the mucilage of flaxseed. By boiling the seed with water and precipitating the strained decoction with twice its volume of alcohol, he obtained a substance which, after drying, consisted of opaque, yellowish-brown irregular fragments, somewhat brittle, but not easily reduced to powder, dissolving in water to a turbid mucilaginous solution. Of this, five grains were sufficient to emulsify an ounce of cod-liver oil. The large quantity of alcohol required for the precipitation and the difficulty of drying the adhesive product are, however, serious objections to this product. The author, therefore, studied the subject further, and believes that he has satisfactorily solved the problem.

He still employs flaxseed as the source of mucilage, but by treatment with sulphuric acid he converts this into a gum more resembling acacia. He directs to boil one part of flaxseed with eight of dilute sulphuric acid and eight parts of water until the mixture, which at first thickens, becomes quite fluid. The mixture is then strained through muslin, and to the strained fluid is added four times its volume of strong alcohol. The precipitate is collected on a filter, washed with alcohol, and dried. The alcohol, after neutralizing with chalk, may be recovered by distillation, or it may be used for many purposes without distillation. The gum thus obtained is in the form of translucent, grayish-brown, brittle fragments, easily pulverized, and without odor or taste. Thirty grains of this gum will emulsify an ounce of cod-liver oil, and the product resembles exactly that made by the use of acacia.

Another substitute for acacia, made from starch, has been recently patented in Germany by Sohmann. Two hundred parts of starch are boiled under a pressure of two to three atmospheres with 1000 parts of water and one part of sulphuric or nitric acid, until the mixture begins to be fluid. The acid is then neutralized, and the mixture is again treated under a pressure of three to four atmospheres, until the starch is completely converted into gum-like substances. After filtering through animal charcoal the solution is evaporated at a low temperature. The product is a transparent colorless substance, which is non-hygroscopic, and has essentially the same useful properties as gum arabic.—*Pharm. Era.*

INCREASING THE EGGS.—The white of an egg is albumen; protein makes albumen; cotton-seed meal is rich in protein. These three brief statements bear a close connection to each other. From them can be derived a hint upon increasing the egg production. Hens, to lay abundantly, must be furnished with the materials out of which eggs are formed, and of these materials protein is the most important, as it is the most expensive. But cotton-seed meal containing over one-third of digestible protein helps to solve the problem of obtaining albuminous food for laying hens. But cotton-seed meal should be used judiciously. It is a highly concentrated food, and hens cannot profitably dispose of much of it at one time. If a teaspoonful to each hen, mixed with equal parts of wheat-bran and cornmeal, be given at the start, the fowls will suffer no inconvenience and the quantity can be gradually increased. But a large quantity at a time will never be needed. It is difficult to state what should be the maximum quantity, but a careful observer would determine that by the condition of his fowls. Nothing in feeding can take the place of experienced observation.

COLORS IN LEATHER.—Modern leather manufacturers, says the *Shoe and Leather Reporter*, are surpassing the ancients in the diversity and beauty of the colors they are introducing. Many of the shades produced in upper leather are highly attractive. The Thebans were thought to have attained great proficiency in this art, but the variety of colors they are credited with was meager compared with the iridescent display of our epoch. Remnants of leather found in Theban tombs reveal the use of acacia and other trees in the tanning process. The Jews, after the exodus, probably put into practice the knowledge obtained of this art under the Pharaohs, in preparing ram's skins dyed red for the service of the Tabernacle. The love of colors is as old as the human race. The art of dyeing leather, so long practiced on the Mediterranean, was afterward attained with difficulty by other European countries. But we need no longer go to Egypt or the Mediterranean for instruction concerning it.

THE EFFECTS OF AN EXPLOSION OF AN AMMONIA-TANK.—The Cincinnati *Enquirer* states that an explosion of an ammonia-tank occurred on May 6th at the Buckeye brewery, with a very strange result. Almost immediately after the explosion every bird in the neighborhood fell dead. Chippies, English sparrows and canaries all suffered alike, and after the shock, dead birds could be seen lying about the sidewalks in that locality in great numbers. The explosion caused an alarm of fire to be sent in, and the hose attached to the hose-reel, No. 5, which responded, came near being killed by the ammonia. The animal dashed toward the supposed fire with all the speed he possessed, but

when the strong odor of the ammonia struck his nostrils he was completely overcome and could not move. The horse was at once withdrawn from the place and restoratives applied.

TO EXPEL MOSQUITOES FROM A SLEEPING-ROOM.—Take a sponge dipped in camphorated spirits and make it fast to the top of the bedstead. It will be found largely serviceable; or, take of gum camphor a piece about one-third the size of a hen's egg, and evaporate it by placing it in a tin vessel, and holding it over a lamp, taking care that it does not ignite. The smoke will soon fill the room and expel the mosquitoes, and, even though the windows should be left open all night, they will not enter the room as long as the odor remains. A decoction of pennyroyal, applied to the exposed parts, will generally be quite effectual in keeping off these troublesome insects.

TO DISTINGUISH FRESH EGGS.—The following is a simple French test for telling whether eggs are fresh or not: Dissolve two ounces of salt in a pint of water. When a fresh-laid egg is placed in this solution it will descend to the bottom of the vessel, while one which has been laid the day previously will not quite reach the bottom. If the egg be three days old it will float in the liquid; and if more than three days old it will float on the surface, projecting above the latter more and more as it happens to be lighter with increased age.

A LITTLE KNOWLEDGE A DANGEROUS THING. A little knowledge is certainly a dangerous thing when applied to chemistry. To facilitate the cleaning of a bottle which contained glycerine, a hospital nurse poured in some nitric acid, thereby unintentionally forming the explosive compound nitro-glycerine. The bottle burst in her hands, and her face was badly mangled by the pieces.

A BEAUTIFUL BIRD.—There is a wonderful brown and golden bird in Mexico, a species of bee-eater, that is a remarkably expert bee-catcher. He has a way of ruffling up the feathers on top of his head so that his crest looks exactly like a beautiful flower. When a bee comes along to sip honey from this delusive blossom it is snapped up and devoured.

GLASS FOR POLISHING POWDER.—A very useful polishing powder for metals and glass is made of very finely ground glass mixed with a small portion of dried soda ash.

POLISH bright ironwork with rotten-stone and oil, if it is running machinery.

GOOD HEALTH.

The Use of Water at and Before Meals.

Opinions differ as to the effect of the free ingestion of water at meal-times, but the view generally received is probably that it dilutes the gastric juice, and so retards digestion. Apart from the fact that a moderate delay in the process is by no means a disadvantage, as Sir William Roberts has shown in his explanation of the popularity of tea and coffee, it is more than doubtful whether any such effect is in reality produced. When ingested during meals, water may do good by washing out the digested food and by exposing the undigested part more thoroughly to the action of the digestive ferments.

Pepsin is a catalytic body, and a given quantity will work almost indefinitely, provided the peptones are removed as they are formed. The good effects of water, drunk freely before meals, have, however, another beneficial result; it washes away the mucus which is secreted by the mucous membrane during the intervals of repose and favors peristalsis of the whole alimentary tract. The membrane thus cleansed is in a much better condition to receive food and convert it into soluble compounds. The accumulation of mucus is especially marked in the morning, when the gastric walls are covered with a thick, tenacious layer. Food entering the stomach at this time will become covered with the tenacious coating, which for a time protects it from the action of the gastric ferments, and so retards digestion. The viscid contents, a normal condition in the morning before breakfast, is not suitable to receive food.

Exercise before partaking of a meal stimulates the circulation of the blood and facilitates the flow of blood through the vessels. A glass of water washed out the mucus, partially distends the stomach, wakes up peristalsis and prepares the alimentary canal for the morning meal. Observation has shown that non-irritating liquids pass directly through the "tubular" stomach, and even if food be present they only mix with it to a light extent.—*The British Medical Journal.*

COLD WATER AS A STIMULANT.—SPONGE BATHS.—A sponge bath of cold or tepid water, says *Table Talk*, often reverts one when very tired. This can be taken in 10 minutes, as it is better, if one has not time to do more, to simply wring the cloth or sponge nearly dry and go over the surface of the body once, rubbing thoroughly afterward with Turkish towels, than to omit daily bathing entirely. Those who do household work need to bathe oftener than those who do not, for they certainly absorb more dust and

throw off more impurities, their work being such as to cause them to perspire freely. Pumice-stone, good soap, scrubbing brushes for the hands, lemon juice for stains and vaseline or rose-water and glycerine, or cold cream, should be kept on the shelf over the kitchen sink. To apply one of the last frequently to the hands and also to occasionally rub the face and neck with a dry cloth tends to keep the skin and hands in good condition. When you see the cloth after rubbing you will be amazed to discover that you had so dirty a lace. The face and neck should always be cleansed before going to bed by using a dry cloth or one moistened in tepid water, and cold cream, or something of the sort, applied. For the morning and afternoon washes cold water is more refreshing and stimulating than warm. It is well always to apply an agent after washing, rubbing off and in, when used during the day. By using these means no woman need have the coarse, rough, unnaturally dark skin which is undeniably produced by constant housework, unless some precautions be taken to counteract its effect, and remember, it does not require so much time to take these precautions as to read or think of them. Have the appliances convenient, and after the habit is once formed of using them you will find it harder to forget these luxuries than it was at first to remember them.

CAN A FLY IMPORT RABIES?—We clip the following from the Louisville *Courier-Journal*: Henry Pryor, a laborer at the car works in Jeffersonville, was eating his noon lunch on a recent occasion, when a large fly alighted upon his hand. His attention was attracted to the insect by a sharp pricking sensation that ran through the nerves of his arm. In a few minutes the hand began to swell, the enlargement continuing toward the shoulder. The pain was so intense that he laid off and started for home. Before he reached there his arm had swollen to such a size that his shirt-sleeve had to be cut off. For some reason the pain or enlargement did not continue above the shoulder, except to a small extent. Numerous remedies have been applied to the affected parts, but no relief has been obtained, and Pryor continues to suffer. Yesterday the flesh commenced taking a greenish hue, and it is thought that amputation will be necessary. The physician who is attending Pryor is of the impression that the fly had been on some of the rabid dogs that have been killed in Jeffersonville and had carried the virus with it, inoculating the affected man.

A NEW USE FOR TOBACCO.—A new use has been discovered for tobacco. A father, whose child was dying of membranous croup, remembered how deathly sick he was the first time he chewed tobacco, and, having a pipe in his mouth, without thinking twice, he opened the child's mouth and placed the tobacco in. The father knew it was a desperate act, and he waited in terrible suspense for the result. It came, and quicker than he could have hoped. There was a sudden convulsive movement, and the poor little thing was nearly doubled for an instant, and seemed to writhe in agony, when, throwing herself forward, there shot from her throat a chunk of almost solid phlegm at least two inches long, and having through it a passage no larger than a small lead-pencil. After a few minutes of retching, the little one lay quietly back and slept calmly and sweetly, and the next day was playing around the house with all her wonted vim.

THE FRUIT CURE.—Dr. M. L. Holbrook, a well-known writer on hygiene, paid, in a parlor lecture, a tribute to what may be called the tonic or medicinal properties of fruits. We copy a paragraph of personal experience: "One or two pounds of fresh, ripe fruit daily eaten by most persons would make doctors' visits less frequent. There seems to be a cleansing action to good acid fruit, and especially to the apple and the grape. Children and the young should be allowed all they wish. In Delaware, doctors sometimes send certain patients into the peach orchards and tell them to eat all they want. Wilson, the ornithologist, suffered with a chronic malaria, which his medical adviser could not cure, and he cured himself by eating wild strawberries. I once cured myself of a malaria by going into a vineyard and eating grapes every day for a week, all I wanted, several pounds a day."

HOT WATER WITH LEMON JUICE.—One of the best and simplest remedies for torpid liver or biliousness is a glass of hot water with the juice of half a lemon squeezed in it, but no sugar, night and morning. A person to whom this was recommended tried it, and found himself better almost immediately. His daily headaches, which medicine had failed to cure, left him; his appetite improved, and he gained several pounds within a few weeks. This is so simple a remedy that any person thus afflicted will do well to give it a trial, as it cannot possibly do any harm.

NEW THEORY AS TO THE TREATMENT OF FROST BITES.—A medical journal states that new experiments have changed old theories upon the best methods of treating frost bites. A physician froze 60 dogs into a condition of completely suspended animation. Twenty of these were treated by the usual method of gradual resuscitation in a cold room, and of these 14 perished. Twenty were treated in a warm apartment, and eight of these died, while of the remaining 20, which were put at once into a hot bath, all recovered.

ENGINEERING NOTES.
